C. The Public Library, the Public School, and the Social Center Movement —*Bostwick* 240
D. The Organization and Administration of Recreation and Social Center Work—*Stern* 246
E. The Social Center and the Rural Community—*Quick* 250

TOPIC: THE PUBLIC SCHOOLS AND THE PUBLIC HEALTH
A. The Duty of the State in the Medical Inspection of Schools; Results Which the Public May Rightfully Expect—*Dresslar* 257
B. The Teaching of Personal Hygiene in the Schools—*Jordan* 264
C. Sanitary Education in Rural Communities—*North* 267
D. The Medical Inspection of Schools and Medical Freedom—*Reed* . . 273
E. Some Problems in Education as Related to the Public Health—*Wiley* . 278

TOPIC: RURAL LIFE CONDITIONS AND RURAL EDUCATION
A. A Social and Educational Survey of the Rural Community—*Wilson* . 281
B1. What Is Being Done to Meet the Problem by the Schools of Guilford County, N.C.—*Foust* 286
B2. What Is Being Done to Meet the Problem by the State of Oregon—*Alderman* 291
B3. What Is Being Done to Meet the Problem by the State of North Dakota —*Worst* 295
C. The Humanity of Highways—*DeGarmo* 301
D. The School, the College, and the English Farmer—*Russell* . . . 307

The Best Next Thing for the Teaching Profession—*Winship* 313
Peace and Arbitration—*von Suttner* 316
Camp Fire Girls—*Sebbelov* 320
The Camp Fire Girls and the New Relation of Women to the World—*Gulick* . 322

DEPARTMENT OF SUPERINTENDENCE (St. Louis Meeting, 1912)

Secretary's Minutes—*Updegraff* 329
Address of Welcome—*Cave* 335

TOPIC: ORGANIZATION AFFECTING THE COURSE OF STUDY AND ECONOMY OF TIME
A. Waste and Efficiency in School Studies—*Elson* 335
B. Departmental Teaching in the Elementary Grades—*Stephens* . . . 343
C. The Child versus Promotion-Machinery—*Phillips* 349
D. Some Adjustments and Changes in the Course of Study and School Organization Suggested by the Needs and the Capacities of Children That Vary from the Standards Set for Average Pupils—*Christensen* 355
E. A Reorganization of Our School System—*Francis* 368

TOPIC: THE DETERMINING OF SCHOOL EFFICIENCY
A. The Value of the Educational Commission in Determining the Efficiency of a City School System—*Kendall* 376
B. The Relation of an Urban Community to Its Public-School System—*Brumbaugh* 381
C. How May a Community Learn Its Unmet School Needs?—*Allen* . . 384
D. Quantitative Tests in Education—*Chatfield* 387
The Function of the Kindergarten in the Public-School System—*Wheelock* . . 395

TOPIC: PROBLEMS RELATING TO CHILD WELFARE
A. The Duty of Superintendents in the Enforcement of Child-Labor Laws —*Lovejoy* 401
B. How Far Shall the Public-School System Care for the Feeble-Minded? —*Van Sickle* 408

C. The City Trade School—An Important Instrumentality for Improving the Vocational Need of the City Child—*Pearse* 411
D. How Should the School System Contribute to an Intelligent Choice of Vocation on the Part of the Pupil?—*Knox* 417
E. The Education of Girls—*Harvey* 425
Vocational Guidance—*Bloomfield* 431
The Schoolhouse as the Civic and Social Center of the Community—*Ward* . . 436
The Bookman in His Relation to the Textbook Problem—*Fitzpatrick* . . . 449
The Effect on Education and Morals of the Moving-Picture Shows—*Fulk* . . 456
The Standardization of Janitor Service—*Wilson* 462
The Relative Cost of Education of High- and Elementary-School Pupils—*Holland* 467

ROUND TABLES

ROUND TABLE OF STATE AND COUNTY SUPERINTENDENTS:
Topic: Agriculture in the Rural School
The Educational Value of Agriculture—*Barnes* 471
The Next Step in Teaching Agriculture in Rural Schools—*Bishop* . . 474

ROUND TABLE OF SUPERINTENDENTS OF LARGER CITIES:
Types of Special Schools in the Larger American Cities—*Edson* 480
A Definite Propaganda to Impress upon the American Mind the Necessity of an Expansion of the Field of Education to Provide as Ample Facilities for Education by Work and Education by Play as Are Now Provided for Education by Study—*Brumbaugh* 487

Report of the Committee on Courses of Study in Agriculture—*Bishop* 1391

NATIONAL EDUCATION ASSOCIATION OF THE UNITED STATES

1857–1870

THE NATIONAL TEACHERS ASSOCIATION

Organized August 26, 1857, at Philadelphia, Pennsylvania.

PURPOSE—*To elevate the character and advance the interests of the profession of teaching, and to promote the cause of popular education in the United States.*

The name of the association was changed at Cleveland, Ohio, on August 15, 1870, to the "National Educational Association."

1870–1907

NATIONAL EDUCATIONAL ASSOCIATION

Incorporated under the laws of the District of Columbia, February 24, 1886, under the name, "National Education Association," which was changed to "National Educational Association," by certificate filed November 6, 1886.

1907–

NATIONAL EDUCATION ASSOCIATION OF THE UNITED STATES

Incorporated under a special act of Congress, approved June 30, 1906, to succeed the "National Educational Association." The charter was accepted and by-laws were adopted at the Fiftieth Anniversary Convention held July 10, 1907, at Los Angeles, California.

ACT OF INCORPORATION

AN ACT TO INCORPORATE THE NATIONAL EDUCATION ASSOCIATION OF THE UNITED STATES

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled:

SECTION 1. That the following named persons, who are now officers and directors and trustees of the National Educational Association, a corporation organized in the year eighteen hundred and eighty-six, under the Act of General Incorporation of the Revised Statutes of the District of Columbia, viz.: Nathan C. Schaeffer, Eliphalet Oram Lyte, John W. Lansinger, of Pennsylvania; Isaac W. Hill, of Alabama; Arthur J. Matthews, of Arizona; John H. Hineman, George B. Cook, of Arkansas; Joseph O'Connor, Josiah L. Pickard, Arthur H. Chamberlain, of California; Aaron Gove, *Ezekiel H. Cook, Lewis C. Greenlee, of Colorado; Charles H. Keyes, of Connecticut; George W. Twitmyer, of Delaware; *J. Ormond Wilson, *William T. Harris, Alexander T. Stuart, of the District

* Deceased.

of Columbia; Clem Hampton, of Florida; William M. Slaton, of Georgia; Frances Mann, of Idaho; J. Stanley Brown, *Albert G. Lane, Charles I. Parker, John W. Cook, Joshua Pike, Albert R. Taylor, Joseph A. Mercer, of Illinois; Nebraska Cropsey, Thomas A. Mott, of Indiana; John D. Benedict, of Indian Territory; John F. Riggs, Ashley V. Storm, of Iowa; John W. Spindler, Jasper N. Wilkinson, A. V. Jewett, Luther D. Whittemore, of Kansas; William Henry Bartholomew, of Kentucky; Warren Easton, of Louisiana; *John S. Locke, of Maine; M. Bates Stephens, of Maryland; Charles W. Eliot, *Mary H. Hunt, Henry T. Bailey, of Massachusetts; Hugh A. Graham, Charles G. White, William H. Elson, of Michigan; *William F. Phelps, Irwin Shepard, John A. Cranston, of Minnesota; Robert B. Fulton, of Mississippi; *F. Louis Soldan, James M. Greenwood, William J. Hawkins, of Missouri; Oscar J. Craig, of Montana; George L. Towne, of Nebraska; Joseph E. Stubbs, of Nevada; James E. Klock, of New Hampshire; James M. Green, John Enright, of New Jersey; Charles M. Light, of New Mexico; *James H. Canfield, Nicholas Murray Butler, William H. Maxwell, Charles R. Skinner, *Albert P. Marble, James C. Byrnes, of New York; James Y. Joyner, Julius Isaac Foust, of North Carolina; Pitt Gordon Knowlton, of North Dakota; Oscar T. Corson, Jacob A. Shawan, Wells L. Griswold, of Ohio; Edgar S. Vaught, Andrew R. Hickham, of Oklahoma; Charles Carroll Stratton, Edwin D. Ressler, of Oregon; Thomas W. Bicknell, Walter Ballou Jacobs, of Rhode Island; David B. Johnson, Robert P. Pell, of South Carolina; Moritz Adelbert Lange, of South Dakota; Eugene F. Turner, of Tennessee; Lloyd E. Wolfe, of Texas; David H. Christensen, of Utah; Henry O. Wheeler, Isaac Thomas, of Vermont; Joseph L. Jarman, of Virginia; Edward T. Mathes, of Washington; T. Marcellus Marshall, Lucy Robinson, of West Virginia; Lorenzo D. Harvey, of Wisconsin; Thomas T. Tynan, of Wyoming; Cassia Patton, of Alaska; Frank H. Ball, of Porto Rico; Arthur F. Griffiths, of Hawaii; C. H. Maxson, of the Philippine Islands, and such other persons as now are or may hereafter be associated with them as officers or members of said Association, are hereby incorporated and declared to be a body corporate of the District of Columbia by the name of the "National Education Association of the United States," and by that name shall be known and have perpetual succession with the powers, limitations, and restrictions herein contained.

SEC. 2. That the purpose and object of the said corporation shall be to elevate the character and advance the interests of the profession of teaching, and to promote the cause of education in the United States. This corporation shall include the National Council of Education and the following departments, and such others as may hereafter be created by organization or consolidation, to wit: the Departments, first, of Superintendence; second, of Normal Schools; third, of Elementary Education; fourth, of Higher Education; fifth, of Manual Training; sixth, of Art Education; seventh, of Kindergarten Education; eighth, of Music Education; ninth, of Secondary Education; tenth, of Business Education; eleventh, of Child Study; twelfth, of Physical Education; thirteenth, of Natural Science Instruction; fourteenth, of School Administration; fifteenth, the Library Department; sixteenth, of Special Education; seventeenth, of Indian Education; the powers and duties and the number and names of these departments and of the National Council of Education may be changed or abolished at the pleasure of the corporation, as provided in its By-Laws.

SEC. 3. That the said corporation shall further have power to have and to use a common seal, and to alter and change the same at its pleasure; to sue or to be sued in any court of the United States, or other court of competent jurisdiction; to make By-Laws not inconsistent with the provisions of this act or of the constitution of the United States; to take or receive, whether by gift, grant, devise, bequest, or purchase, any real or personal estate, and to hold, grant, convey, hire, or lease the same for the purposes of its incorporation; and to accept and administer any trust of real or personal estate for any educational purpose within the objects of the corporation.

SEC. 4. That all real property of the corporation within the District of Columbia,

* Deceased.

which shall be used by the corporation for the educational or other purposes of the corporation as aforesaid, other than the purposes of producing income, and all personal property and funds of the corporation held, used, or invested for educational purposes aforesaid, or to produce income to be used for such purposes, shall be exempt from taxation; *provided*, however, That this exemption shall not apply to any property of the corporation which shall not be used for, or the income of which shall not be applied to, the educational purposes of the corporation; and, *provided further*, That the corporation shall annually file, with the Commissioner of Education of the United States, a report in writing, stating in detail the property, real and personal, held by the corporation, and the expenditure or other use or disposition of the same, or the income thereof, during the preceding year.

SEC. 5. That the membership of the said corporation shall consist of three classes of members—viz., active, associate, and corresponding—whose qualifications, terms of membership, rights, and obligations shall be prescribed by the By-Laws of the corporation.

SEC. 6. That the officers of the said corporation shall be a President, twelve Vice-Presidents, a Secretary, a Treasurer, a Board of Directors, an Executive Committee, and a Board of Trustees.

The Board of Directors shall consist of a President, the First Vice-President, the Secretary, the Treasurer, the chairman of the Board of Trustees, and one additional member from each state, territory, or district, to be elected by the active members for the term of one year, or until their successors are chosen, and of all life directors of the National Educational Association. The United States Commissioner of Education, and all former Presidents of the said Association now living, and all future Presidents of the Association hereby incorporated, at the close of their respective terms of office, shall be members of the Board of Directors for life. The Board of Directors shall have power to fill all vacancies in their own body; shall have in charge the general interests of the corporation, excepting those herein intrusted to the Board of Trustees; and shall possess such other powers as shall be conferred upon them by the By-Laws of the corporation.

The Executive Committee shall consist of five members, as follows: the President of the Association, the First Vice-President, the Treasurer, the Chairman of the Board of Trustees, and a member of the Association, to be chosen annually by the Board of Directors, to serve one year. The said committee shall have authority to represent, and to act for, the Board of Directors in the intervals between the meetings of that body, to the extent of carrying out the legislation adopted by the Board of Directors under general directions as may be given by said board.

The Board of Trustees shall consist of four members, elected by the Board of Directors for the term of four years, and the President of the Association, who shall be a member *ex officio*, during his term of office. At the first meeting of the Board of Directors, held during the annual meeting of the Association at which they were elected, they shall elect one trustee for the term of four years. All vacancies occurring in said Board of Trustees, whether by resignation or otherwise, shall be filled by the Board of Directors for the unexpired term; and the absence of a trustee from two successive annual meetings of the board shall forfeit his membership.

SEC. 7. That the invested fund now known as the "Permanent Fund of the National Educational Association," when transferred to the corporation hereby created, shall be held by such corporation as a Permanent Fund and shall be in charge of the Board of Trustees, who shall provide for the safekeeping and investment of such fund, and of all other funds which the corporation may receive by donation, bequest, or devise. No part of the principal of such Permanent Fund or its accretions shall be expended, except by a two-thirds vote of the active members of the Association present at any annual meeting, upon the recommendation of the Board of Trustees, after such recommendation has been approved by vote of the Board of Directors, and after printed notice of the proposed expenditure has been mailed to all active members of the Association. The income of the Permanent Fund shall be used only to meet the cost of maintaining the organization of the

Association and of publishing its annual volume of *Proceedings*, unless the terms of the donation, bequest, or devise shall otherwise specify, or the Board of Directors shall otherwise order. It shall also be the duty of the Board of Trustees to issue orders on the Treasurer for the payment of all bills approved by the Board of Directors, or by the President and Secretary of the Association acting under the authority of the Board of Directors. When practicable, the Board of Trustees shall invest, as part of the Permanent Fund, all surplus funds exceeding five hundred dollars that shall remain in the hands of the Treasurer after paying the expenses of the Association for the previous year, and providing for the fixed expenses and for all appropriations made by the Board of Directors for the ensuing year.

The Board of Trustees shall elect the Secretary of the Association, who shall also be secretary of the Executive Committee, and shall fix the compensation and the term of his office for a period not to exceed four years.

SEC. 8. That the principal office of the said corporation shall be in the city of Washington, District of Columbia; *provided*, That the meetings of the corporation, its officers, committees, and departments, may be held, and that its business may be transacted, and an office or offices may be maintained, elsewhere, within the United States, as may be determined, by the Board of Directors, or otherwise in accordance with the By-Laws.

SEC. 9. That the Charter, Constitution, and By-Laws of the National Educational Association shall continue in full force and effect until the charter granted by this act shall be accepted by such Association at the next annual meeting of the Association, and until new By-Laws shall be adopted; and that the present officers, directors, and trustees of said Association shall continue to hold office and perform their respective duties as such until the expiration of terms for which they were severally elected or appointed, and until their successors are elected. That at such annual meeting the active members of the National Educational Association, then present, may organize and proceed to accept the charter granted by this act and adopt By-Laws, to elect officers to succeed those whose terms have expired or are about to expire, and generally to organize the "National Education Association of the United States"; and that the Board of Trustees of the corporation hereby incorporated shall thereupon, if the charter granted by this act be accepted, receive, take over, and enter into possession, custody, and management of all property, real and personal, of the corporation heretofore known as the National Educational Association, incorporated as aforesaid, under the Revised Statutes of the District of Columbia and all its rights, contracts, claims, and property of every kind and nature whatsoever, and the several officers, directors, and trustees of such last-named Association, or any other person having charge of any of the securities, funds, books, or property thereof, real or personal, shall on demand deliver the same to the proper officers, directors, or trustees of the corporation hereby created. *Provided*, That a verified certificate executed by the presiding officer and secretary of such annual meeting, showing the acceptance of the charter granted by this act by the National Educational Association shall be legal evidence of the fact, when filed with the Recorder of Deeds of the District of Columbia; and, *provided further*, That in the event of the failure of the Association to accept the charter granted by this act at said annual meeting then the charter of the National Educational Association and its corporate existence shall be, and are hereby extended until the thirty-first day of July, nineteen hundred and eight, and at any time before said date its charter may be extended in the manner and form provided by the general corporation law of the District of Columbia.

SEC. 10. That the rights of creditors of the said existing corporation, known as the National Educational Association, shall not in any manner be impaired by the passage of this act, or the transfer of the property heretofore mentioned, nor shall any liability or obligation, or the payment of any sum due or to become due, or any claim or demand, in any manner, or for any cause existing against the said existing corporation, be released or impaired; and the corporation hereby incorporated is declared to succeed to the obligations and liabilities, and to be held liable to pay and discharge all of the debts, liabilities,

and contracts of the said corporation so existing, to the same effect as if such new corporation had itself incurred the obligation or liability to pay such debt or damages, and no action or proceeding before any court or tribunal shall be deemed to have abated or been discontinued by reason of this act.

SEC. 11. That Congress may from time to time alter, repeal, or modify this act of incorporation, but no contract or individual right made or acquired shall thereby be divested or impaired.

Approved June 30, 1906.

Accepted and adopted as the Constitution of the National Education Association of the United States by the active members of the National Educational Association in annual session at Los Angeles, Cal., July 10, 1907.

BY-LAWS

(Amended at meeting of active members held in Chicago, Ill., July 10, 1912)

ARTICLE I—MEMBERSHIP

SECTION 1. Teachers, others actively engaged in educational work, and educational institutions as defined in Section 2, may become active members of the National Education Association of the United States upon the payment of an enrollment fee of two dollars and the annual dues for the current year.

SEC. 2. Educational institutions shall include schools, school boards, library boards, educational publishers, and such clubs and similar organizations as are distinctly educational or have educational departments properly organized with a definite membership.

SEC. 3. Educational institutions as defined in Section 2 may be enrolled as active members and represented by any person regularly connected with or a member of the institution, and such representative may exercise all the rights and enjoy all the privileges of active membership, including the right to vote at business meetings; *provided*, That such representative presents a certificate showing that the person named therein has been regularly elected as such representative of the faculty or membership of such institution; but no person shall under any circumstances have the right to cast more than one vote.

SEC. 4. The annual dues of active members are two dollars, which shall be paid at the time of the annual meeting of the Association, or shall be sent to the Secretary before November 1 of each year. An active member may discontinue his membership by giving written notice to the Secretary before November 1. An active member forfeits his membership by being two years in arrears. Those who have forfeited or discontinued their membership may exercise the option of renewing the same by paying all arrears and getting the published *Proceedings* of the intervening years, or of becoming members on the same terms as new members. Active members shall be entitled to the published *Proceedings* without coupon or other conditions.

SEC. 5. All life members and life directors shall be denominated active members, and shall have all the rights and privileges of such members without the payment of the annual dues.

SEC. 6. The right to vote and to hold office in the Association, the Council, or the departments is open to all active members whose dues are paid.

SEC. 7. Any person may become an associate member for one year by paying a membership fee of two dollars.

SEC. 8. Eminent educators not residing in America may be elected, by the Board of Directors, corresponding members. The number of corresponding members shall at no time exceed fifty. They shall not pay any dues.

SEC. 9. The names of active and corresponding members shall be printed in the

published *Proceedings*, or the *Yearbook* of the Association, with their respective educational titles, offices, and addresses.

ARTICLE II—ELECTION OF OFFICERS.

SECTION 1. The President, Vice-Presidents, Treasurer, and Directors of the National Education Association of the United States shall be chosen by the active members of the Association by ballot, at their annual business meeting, a majority of the votes cast being necessary for a choice. They shall continue in office until the close of the annual meeting subsequent to their election, and until their successors are chosen, except as herein provided. The Secretary and the Treasurer shall enter upon their duties at a date which shall be determined by the Board of Trustees and which shall not be later than the first of October and shall continue in office during the terms for which they are separately chosen and until their successors are duly elected.

ARTICLE III—DUTIES OF OFFICERS

SECTION 1. The President shall preside at all meetings of the Association, and shall perform the duties usually devolving upon the chief executive of such an association. In his absence, the ranking Vice-President who is present shall preside; and in the absence of all Vice-Presidents a chairman *pro tempore* shall be elected. The President shall prepare the program for the general sessions of the annual meeting of the Association, and with the approval of the Executive Committee, shall determine the time and place of the general meeting of the Association and of the various departments not definitely fixed by these By-Laws, and shall have the power to require such changes to be made in the programs of the Council and the departments as will promote the interest of the annual meeting. The President shall be a member *ex officio* of the Board of Trustees and chairman of the Board of Directors and of the Executive Committee. He shall sign all bills approved for payment by the Board of Directors, and all bills approved or authorized by the Executive Committee between the meetings of the Board of Directors. On the expiration of his term of office as President, he shall become first Vice-President for the ensuing year, and shall be chairman *ex officio* of the Committee on Publication.

SEC. 2. The Secretary shall keep a full and accurate record of the proceedings of the general meetings of the Association and all meetings of the Board of Directors and of the Executive Committee, shall conduct the business of the Association as provided in the Articles of Incorporation and the By-Laws, and in all matters not definitely prescribed therein, shall be under the direction of the Executive Committee and in the absence of direction by the Executive Committee, shall be under the direction of the President, and shall receive or collect all moneys due the Association and pay the same each month to the Treasurer, shall countersign all bills approved for payment by the Board of Directors or by the Executive Committee in the interval between the meetings of the Board of Directors or on the approval of the President acting under authority of the Board of Directors, or Executive Committee. The Secretary shall have his records present at all meetings of the active members of the Association, of the Board of Directors, and of the Executive Committee. He shall keep a list of members as required by Section 9 of Article I of these By-Laws and shall revise said list annually. He shall be secretary of the Board of Directors, and a member of the Committee on Publication. He shall be the custodian of all the property of the Association not in charge of the Treasurer and the Board of Trustees. He shall give such bond for the faithful performance of his duties as may be required by the Board of Trustees. He shall submit his annual report to the Executive Committee not later than July 1 prior to the annual meeting of the Association, which report shall be transmitted to the Board of Directors at its annual meeting. At the expiration of his term of office, he shall transfer to his successor all moneys, books, and other property in his possession belonging to the Association. The

Secretary shall not print, publish, or distribute any official report or other document without the approval of the publication committee.

SEC. 3. The Treasurer shall receive from the Secretary and under the direction of the Board of Trustees shall hold in safekeeping all moneys paid to the Association; shall pay the same only upon the order of the Board of Trustees; shall notify the President of the Association and the Chairman of the Board of Trustees whenever the surplus funds in his possession exceed five hundred dollars; shall keep an exact account of his receipts and expenditures, with vouchers for the latter; and said accounts, ending on the thirtieth day of June of each year, he shall render to the Executive Committee not later than July 1, and when approved by said committee, they shall be transmitted by the committee to the Board of Directors at the first regular meeting of the board held during the week of the annual meeting and to the active members at their annual business meeting. The Treasurer shall give such bond for the faithful performance of his duties as may be required by the Board of Trustees. At the expiration of his term of office, he shall transfer to his successor all moneys, books, and other property in his possession belonging to the Association.

SEC. 4. The Board of Directors shall elect corresponding members as prescribed by Section 8 of Article I of these By-Laws, shall elect members of the National Council of Education as provided in Section 3 of Article IV of these By-Laws, shall have power to fill all vacancies in its own body and in the Board of Trustees; shall recommend to the Executive Committee the place for holding the annual meeting of the Association, the Council of Education, and the departments. The Board of Directors shall approve all bills incurred under authority of the Board of Directors, the Executive Committee, or the President and Secretary acting under the authority of the Board of Directors or Executive Committee, shall appropriate from the current funds of the year the amounts of money ordered by the active members at their annual business meeting for the work of all special committees of investigation and research authorized and provided for by such active members at their annual business meeting, shall make a full report of the financial condition of the Association (including the reports of the Secretary, the Treasurer, and the Board of Trustees) to the active members at their annual business meeting, and shall do all in its power to make the Association a useful and honorable institution.

SEC. 5. The Executive Committee shall assist the presiding officer in arranging for the time and place of the annual meeting of the Association, of the National Council of Education, and of the various departments.

The Executive Committee shall recommend to active members at their annual business meeting the appointment of special committees for investigation or research, the subjects for which may have been suggested by the National Council or by the active membership of the National Education Association or by any of its departments; it shall recommend the amount of money to be appropriated for such investigations. When such special committees are provided for and duly authorized by the active members at their annual business meeting, the Executive Committee shall have general supervision of them; shall receive and consider all reports made by them and shall print such reports, and present the same, together with the reports received from the Secretary, the Treasurer, and the Board of Trustees and the recommendations of the Executive Committee thereon, to the active members at their annual business meeting. All such special committees shall be appointed by the President of the National Education Association.

The Executive Committee shall fill all vacancies occurring in the body of officers of the Association except vacancies in the Board of Directors, Board of Trustees, and the office of Secretary.

SEC. 6. The Board of Trustees shall require of the Secretary and Treasurer bonds of such amount as may be determined by said board, for the faithful performance of their duties, shall make a full report of the finances of the Association to the Executive Com-

mittee not later than July 1 prior to the annual meeting of the Association, which report shall be transmitted by the Executive Committee to the Board of Directors at the first regular meeting of the board held during the week of the annual meeting of the Association. It shall choose annually its own chairman and secretary.

ARTICLE IV—THE NATIONAL COUNCIL OF EDUCATION

SECTION 1. The National Council of Education shall discuss educational questions of public and professional interest; propose to the Executive Committee, from time to time, suitable subjects for investigation and research; have a report made at its annual meeting on "Educational Progress during the Past Year"; and in other ways use its best efforts to further the objects of the Association and to promote the cause of education in general.

SEC. 2. The National Council of Education shall consist of one hundred and twenty regular members, selected from the active membership of the National Education Association. Any active member of the Association is eligible to membership in the Council, and each member shall be elected for six years and until his successor is elected.

SEC. 3. The annual election of members of the Council shall be held at the time of the annual meeting of the Association. The Board of Directors of the Association shall annually elect ten members and the Council ten members, and each body shall fill all vacancies in its quota of members. No state, territory, or district in the United States shall have at one time more than seven regular members in the Council.

SEC. 4. The annual meeting of the Council shall be held during the week of the annual meeting of the Association.

SEC. 5. The absence of a regular member from two successive annual meetings of the Council shall be considered equivalent to his resignation of membership. Persons whose regular membership in the Council has expired shall be denominated honorary members of the Council during the time of their active membership in the Association, with the privilege of attending the regular sessions of the Council and participating in its discussions. A member who discontinues or forfeits his active membership in the Association forfeits his membership in the Council.

SEC. 6. The officers of the Council shall consist of a president, a vice-president, a secretary, and such standing committees as may be prescribed by its by-laws, all of whom shall be regular members of the Council. The secretary of the Council shall, in addition to performing the duties pertaining to his office, furnish the Secretary of the Association a copy of the proceedings of the Council for publication.

SEC. 7. The National Council of Education is hereby authorized to adopt by-laws or its government not inconsistent with the Act of Incorporation or the By-Laws of the Association; *provided*, That such by-laws be submitted to, and approved by, the Board of Directors of the Association before they shall become operative.

SEC. 8. The powers and duties of the Council may be changed or the Council abolished upon a two-thirds vote of the Association taken at the annual business meeting of the Association; *provided*, That notice of the proposed action has been given at the preceding annual business meeting of the Association.

ARTICLE V—DEPARTMENTS

SECTION 1. The following departments are now (1912) in existence, to wit: The departments, first, of Superintendence; second, of Normal Schools; third, of Elementary Education; fourth, of Higher Education; fifth, of Manual Training, Art, and Technical Education; sixth, of Kindergarten Education; seventh, of Music Education; eighth, of Secondary Education; ninth, of Business Education; tenth, of Child Study; eleventh, of Physical Education; twelfth, of Natural Science Instruction; thirteenth, of School

Administration; fourteenth, the Library Department; fifteenth, of Special Education; sixteenth, of School Patrons; seventeenth, of Rural and Agricultural Education.

SEC. 2. The active members of the Association, and no others, are members of each department of the Association.

SEC. 3. Each department shall hold its annual meeting at the time and place of the annual meeting of the Association, except the Department of Superintendence and the Department of Normal Schools, which may hold their annual meeting in February of each year or at such other times as may be determined by said departments, subject to the approval of the Board of Directors of the Association.

SEC. 4. The object of the meetings of the departments shall be the discussion of questions pertaining to their respective fields of educational work. The programs of these meetings shall be prepared by the respective presidents in conference with, and under the general direction of, the President of the Association. Each department shall be limited to two sessions, with formal programs, unless otherwise ordered by the President of the Association, except that a third session for business or informal round-table conference may be held at the discretion of the department officers.

SEC. 5. The officers of each department shall consist of a president, a vice-president, and a secretary, who shall be elected at the last formal session of the department to serve one year and until their successors are duly elected, and who shall, at the time of their election, be active members of the Association.

SEC. 6. The secretary of each department shall, in addition to performing the duties usually pertaining to his office, furnish the Secretary of the Association a copy of the proceedings of the meetings of the department for publication.

SEC. 7. All departments shall have equal rights and privileges, with the exception stated in Section 3 of this article. They shall be named in Section 1 of this article in the order of their establishment and shall be dropped from the list when discontinued. Each department may be governed by its own regulations in so far as they are not inconsistent with the Act of Incorporation or these By-Laws.

SEC. 8. A new department may be established by a two-thirds vote of the Board of Directors taken at a regular meeting of the board or by a two-thirds vote of the active members at any annual business meeting; *provided*, That a written application for said department, with title and purpose of the same, shall have been made at the regular meeting of the board next preceding the one at which action is taken, or at the preceding annual business meeting, by at least twenty-five members engaged or interested in the field of labor in the interest of which the department is purposed to be established. A department already established may be discontinued by the Board of Directors upon a two-thirds vote taken at a regular meeting, or by a two-thirds vote of the active members at any business meeting of the active members; *provided*, That announcement has been made of the proposed action at a regular meeting of the board the preceding year, or at the preceding annual business meeting. A department shall be discontinued when it fails to hold a regular meeting for two successive years.

ARTICLE VI—COMMITTEES

SECTION 1. On the first day of each annual meeting of the Association the President shall appoint a Committee on Resolutions, consisting of seven active members, and a Committee on Necrology, consisting of five active members, and on the third day of such meeting he shall appoint a Committee on Nominations, consisting of one active member from each state, territory, and district represented at the meeting. Each state, territorial, and district representative shall be appointed on the nomination of the active members in attendance from said state, territory, or district; *provided*, That three or more active members participate in said nomination in accordance with these By-Laws; and *provided further*, That in case of the failure of the active members of any state, terri-

tory, or district, to nominate a member of the nominating committee in accordance with these By-Laws, the President shall appoint an active member from said state, territory, or district, to serve on said committee. At the regular meeting of the Board of Directors on the first day of the annual meeting, the President shall appoint an Auditing Committee consisting of three active members of the Association, no one of whom shall be either a trustee or a director; to this committee shall be referred the report of the expert accountant, together with the communication of the President transmitting the same, as provided in Section 6 of this article; and the committee shall report its findings at the meeting of active members. The chairman of each of the foregoing committees shall be designated by the President of the Association at the time of its appointment.

SEC. 2. The meetings of active members present from the several states, territories, etc., to nominate members of the nominating committee shall be held on the first day of the annual meeting of the Association, at such time and places as shall be designated on the annual program by the President of the Association.

SEC. 3. The Committee on Nominations shall meet on the fourth day of the annual meeting at 9:00 A.M., at a place designated by the President of the Association, and shall nominate persons for the following offices in the Association, to wit: one person for President, eleven persons for Vice-Presidents, one person for Treasurer, and one person from each state, territory, and district in the United States as a member of the Board of Directors. It shall report to the active members at their annual business meeting.

SEC. 4. The Committee on Resolutions shall report at the annual business meeting of active members, and, except by unanimous consent, all resolutions shall be referred to said committee, without discussion. This committee shall receive and consider all resolutions proposed by active members, or referred to it by the President; some time during the second day of the annual meeting of the Association the committee shall hold a meeting, at a place and time to be announced in the printed program, for the purpose of receiving proposed resolutions and hearing those who may wish to advocate them.

SEC. 5. The Committee on Necrology shall prepare for the published *Proceedings* a list of the active and corresponding members that have died during the year, accompanied by memorial sketches whenever practicable.

SEC. 6. Within thirty days prior to the time of the annual meeting of the Association, the President shall appoint a competent person, firm, or corporation licensed to do business as expert accountants; the accountants so appointed shall examine the accounts, papers, and vouchers of the Secretary, the Treasurer, and the Board of Trustees, and compare the same, and shall also examine the securities of the Permanent Fund held by the Board of Trustees. The report of the said accountants shall be filed with the President before the opening day of the annual meeting of the Association, and shall be by him submitted with such comments as he may think proper, to the Board of Directors, at their meeting held on the first day of the annual meeting of the Association.

ARTICLE VII—MEETINGS

SECTION 1. A stated meeting of the Association, of the Council of Education, and of each department shall be held annually at such time and place as shall be determined by the Board of Directors or the Executive Committee acting for the board in accordance with these By-Laws. An annual meeting of the Association and its subordinate bodies may be omitted for an extraordinary cause, upon the written consent of two-thirds of the directors of the Association, obtained by the Executive Committee.

SEC. 2. The annual meeting of the Association shall be held in July, beginning on a day determined by the Executive Committee. Two sessions shall be held daily, unless otherwise ordered by the President of the Association. The annual business meeting of the active members shall be held on the fourth day of the annual meeting at 11:00 A.M. A regular meeting of the Board of Directors shall be held on the first day of the annual

meeting at 10:30 A.M. The first regular meeting of the new Board of Directors shall be held as soon as practicable and within twenty-four hours after the close of the last session of the annual meeting, the place and time of the meeting to be announced in the printed program. The Board of Trustees shall hold its annual meeting at some convenient time and immediately following the meeting of the new Board of Directors referred to above in this section. Special meetings of the trustees may be called by the chairman, and shall be called on request of the majority of the Board of Trustees. Due notice of all meetings of the Board of Trustees shall be given to every member of the board by the secretary thereof.

ARTICLE VIII—PROCEEDINGS

SECTION 1. The proceedings of the meeting of the Association, the Council, and the departments shall be published under the direction of a committee consisting of the President, the First Vice-President, and the Secretary, the First Vice-President acting as chairman of the committee; *provided*, That in the opinion of the Executive Committee the funds of the Association warrant the publication. Each member of the Association shall be entitled to a copy of the *Proceedings*. Associate members must make written application to the Secretary on or before November 1 for a copy in order to obtain it. Corresponding members, and active members whose dues are paid, will receive the published *Proceedings* without written application.

SEC. 2. No paper, lecture, or address shall be read before the Association or any of the departments in the absence of its author, without the approval of the President of the Association or of the departments interested, nor shall any such paper, lecture, or address be published in the *Proceedings*, without the approval of the Executive Committee.

ARTICLE IX—ELECTIONS, QUORUM

SECTION 1. The certificate of membership, in connection with the official list of active members, shall be accepted as evidence that members are entitled to vote.

SEC. 2. Representatives from twenty-five states and territories shall constitute a quorum in all meetings of active members and of the Board of Directors.

ARTICLE X—AMENDMENTS

SECTION 1. These By-Laws may be altered or amended at the annual business meeting of the active members by unanimous consent, or by a two-thirds vote of the active members present if the alteration or amendment shall have been substantially proposed in writing at the annual business meeting next preceding the one at which action is taken; due announcement of the proposed action shall be made in the annual published *Proceedings*.

NATIONAL EDUCATIONAL ASSOCIATION

NOW KNOWN AS THE

NATIONAL EDUCATION ASSOCIATION OF THE UNITED STATES

CERTIFICATE

of Acceptance of Charter and Adoption of By-Laws under Act of Congress approved June 30, 1906.

We, the undersigned, Nathan C. Schaeffer, the presiding officer, and Irwin Shepard, the secretary of the meeting of the National Educational Association held at Los Angeles, California, on the 10th day of July, 1907, said meeting being the annual meeting of the Asso-

ciation held next after the passage of an act of Congress entitled "An Act to Incorporate the National Education Association of the United States,"

Do hereby certify, that at said meeting held pursuant to due notice, a quorum being present, the said Association adopted resolutions of which true copies are hereto attached, and accepted the Charter of the National Education Association of the United States, granted by said act of Congress, and adopted By-Laws as provided in said act and elected officers; and the undersigned pursuant to said resolutions

Do hereby certify that the National Education Association of the United States has duly accepted said Charter granted by said act of Congress, and adopted By-Laws, and is the lawful successor to the National Educational Association.

In witness whereof, we have hereunto signed our names this 20th day of August, 1907.

NATHAN C. SCHAEFFER, *Presiding Officer*
IRWIN SHEPARD, *Secretary*

VERIFICATION

RESOLUTIONS ADOPTED BY THE ACTIVE MEMBERS, JULY 10, 1907

1. *Resolved*, That the National Educational Association hereby accepts the Charter granted by an act of Congress entitled "An Act to Incorporate the National Education Association of the United States," passed June 30, 1906, and that the President and Secretary of this meeting be authorized and directed to execute and file with the Recorder of Deeds of the District of Columbia a verified certificate showing the acceptance by the Association of the Charter granted by said act.

2. *Resolved*, That the proposed By-Laws of which notice was given at the annual meeting of the Association held on July 6, 1905, which are printed in full in the journal of said meeting, be and the same are hereby adopted to take effect immediately.

3. *Resolved*, That the Association adopt as its corporate seal a circle containing the title "National Education Association of the United States," and the dates "1857–1907."

4. *Resolved*, That the Association do now proceed to elect officers, and to organize under the Charter granted by the act of Congress.

Filed in the office of the Recorder of Deeds of the District of Columbia, September 4, 1907.

Secretary	E. C. Bishop, Schools Section, Iowa State College	Ames, Iowa

*Resigned.

TREASURER'S REPORT

OF THE

NATIONAL EDUCATION ASSOCIATION

JULY 1, 1911, TO JUNE 30, 1912

To the Board of Directors, National Education Association:

In presenting my report to the Board of Directors, I desire first to thank the Secretary, Dr. Irwin Shepard, for his courteous co-operation, willing and able help at all times during my year's work as Treasurer. He is practically the Secretary-Treasurer, or Financial Secretary, of the Association, and the work would be done more satisfactorily, expeditiously, and economically, if that fact were recognized in the By-Laws, and the financial affairs left entirely in the hands of the Secretary, the treasurership abolished, and instead of a Treasurer, a Corresponding Secretary elected whose duty it should be to issue all membership certificates. This, with the President, the Board of Trustees, and the annual audit, would be a quite sufficient check upon the work of the Financial Secretary. Whether this change in the charter is made or not, I believe that all the certificates of membership should be in the hands of the Treasurer or Corresponding Secretary and issued by him. At present we are fortunate in having a Secretary of honesty and ability, but the time might come when we would have a young Napoleon of finance instead of Dr. Irwin Shepard and under present conditions it would be easy for him to materially reduce the income of the Association without detection. I therefore recommend that the membership certificates in future be entirely in the hands of the Treasurer, that the Secretary acknowledge the payment of dues on a printed form stating that the Treasurer will send membership certificate later. This would give the Association a second roll of active members, and as the Treasurer's roll would be kept in a different place from that of the Secretary, it would remove the present danger of having the records completely destroyed in case of fire.

I recommend further that the bond for the Treasurer be reduced to a minimum. The Treasurer at present has no check-book, and cannot draw on the funds of the Association. The $10,000 bond now issued is therefore unnecessarily expensive.

Lastly, I recommend that the present regulation limiting the funds at the disposal of the State Directors to $20 each be amended so as to allow the State Director to draw on the Association for actual expenses incurred to an amount not to exceed 25 per cent of the annual dues of the active members in the state for the year of his administration. I make this recommendation on the advice of several successful business men as being in line with modern business methods. Such a policy would doubtless largely increase the membership and the income of the Association. That the present arrangement is unfair will be borne out by the following statistics of the San Francisco convention:

There were 921 active members present at San Francisco. The expenses of the State Directors aggregated $538.59. This was an average of 58 cents per active member present.

Six states together sent 20 members and the expenses of the six State Directors amounted to $106.50, an average cost of $5.33⅓ per active member present.

6 States	Active Members Present	Expenses State Directors	Average Cost per Active Member
20.....	148	$324.74	$2.19
1*.....	146	20.00	0.13
10.....	42	165.05	3.94
1†.....	42	.....	....

* Eleven of the 20 states sending 148 members lay either on a line with, or west of, the one state sending 146 members to the convention.

† With two exceptions, all of the 10 states sending 42 members lay on a line with, or west of, the one state that sent the same number of members as the 10 put together.

A study of convention figures shows that the attendance at conventions is purely a question of the amount of interest aroused in the several states. You cannot arouse interest in a convention without incurring expenses. The State Directors should not be in their present impecunious condition, but should feel free to spend a reasonable amount in "publicity and promotion," knowing that it will be repaid in the percentage of membership dues. The present allowance of $20 for each State Director, if the funds were all used, would amount to $960. The cost of 25 per cent on active membership dues would have amounted to $3,444.50, according to the figures of 1911. This would be a material increase, but I believe that it would pay for itself in the interest aroused in the different states, and would lift the State Directors from the present necessity of petitioning for money to pay for state headquarters from associations, either state or local, in which they were interested. The National Education Association is big enough to have all its officers freed from the cares that come with lack of funds.

The following is a tabulated statement of the year's receipts and expenditures:

Katherine D. Blake, in Account with the National Education Association

BALANCE ON HAND, JULY 1, 1911			
Balance brought forward from Treasurer's Report for year ending June 30, 1911			$ 4,030.13

TWENTY-SIXTH ANNUAL REPORT OF THE BOARD OF TRUSTEES OF THE NATIONAL EDUCATION ASSOCIATION

FOR THE YEAR JULY 1, 1911, TO JUNE 30, 1912

CHICAGO, ILLINOIS, July 6, 1912

To the Board of Directors of the National Education Association:

The Board of Trustees of the National Education Association has the honor to submit for your information its report on the Permanent Fund of the Association for the year ending June 30, 1912.

The several amounts collected as income from the Permanent Fund, and the disposition made of the same, are shown in detail in the Income Account. The amount of the net income paid to the Treasurer of the Association is $7,096.80.

During the year the sum of $10,000 has been added to the Principal of the Fund in accordance with the provisions of Article 7 of the Act of Incorporation.

The Permanent Fund invested now amounts to $190,000 including, cash on hand awaiting investment, June 30, 1912, $3,397.50.

New investment for the fund as shown in the Principal Account consists of $10,000 Kansas City, Mo., School Bonds falling due 1925, purchased at 95 per cent, and bearing 3½ per cent interest payable semi-annually.

The report shows a complete statement of the securities held for the Permanent Fund, June 30, 1912.

Statement A shows the gross income of the property at 4762 Lake Avenue, Chicago, to be $360 and the disbursements $207.20, leaving a net income of $152.80, an increase of $113.82 over the previous year.

The account and statements which follow set forth in detail the financial operations of the year and the present state of the Permanent Fund:

CARROLL G. PEARSE
Board of Trustees

To the Trustees of the National Education Association:

GENTLEMEN: The above and foregoing is a correct statement of the account of the funds of the National Education Association of the United States as the same appears on the books of this bank.

First Trust and Savings Bank,
Chicago, Ill., June 27, 1912 (Signed) By LOUIS BOISOT, *Trust Officer*

To the Board of Directors, The National Education Association of the United States:

We have examined the books and records of the Board of Trustees of the National Education Association of the United States, and certify that, in our opinion, the foregoing statement correctly reflects the condition of the Permanent Fund as at June 30, 1912. We also certify that we have this day examined the securities listed in the foregoing statement, deposited in the custody of the First Trust and Savings Bank of Chicago, Illinois.

MINUTES OF THE MEETING OF ACTIVE MEMBERS OF THE NATIONAL EDUCATION ASSOCIATION FOR THE YEAR 1911–12

CHICAGO, ILL., WEDNESDAY, JULY 10, 1912

The annual meeting of the active members for the election of officers and other business was called to order at the Auditorium Theater by President Carroll G. Pearse at 11:15 A.M., July 10, 1912.

PRESIDENT PEARSE: The first item in the order of business is the reading of the minutes of the last meeting.

SECRETARY SHEPARD: The minutes of the last meeting were printed in the last annual volume and *Yearbook* and have been distributed to the members. Is it desired that they be read at this time?

On motion it was ordered that the reading of the minutes be dispensed with and that they be approved as printed in the volume and *Yearbook* for 1911.

PRESIDENT PEARSE: The next item in the order of business is the report of the Board of Trustees.

James M. Greenwood, of Kansas City, chairman of the Board of Trustees, presented the report of the Board of Trustees with the statement that it was printed and in the hands of all present.

There being no questions asked, on motion, duly seconded, it was ordered that the report of the Board of Trustees be accepted and adopted and printed in the volume of *Proceedings* and *Yearbook*, for the current year.

PRESIDENT PEARSE: The report of the Treasurer, Miss Katherine D. Blake, is next in order.

KATHERINE D. BLAKE, of New York City, Treasurer: As the report is printed and is in your hands, I will spare you any statistics and will merely say that in the report I have made several recommendations. One is that the Treasurer hereafter hold all the membership certificates and that the Secretary acknowledge the payment of dues on a printed form stating that the Treasurer will send membership certificate later. I also recommend that the bond of the Treasurer be reduced to a minimum. I state also that I think that the State Directors ought to be able to pay for headquarters without petitioning other associations.

On motion, duly seconded, the report of the Treasurer was accepted and adopted and ordered printed.

PRESIDENT PEARSE: The next item in the order of business is the "Statement of the Work and Proposals" of the Committee on Teachers' Salaries and Cost of Living, from December, 1911, to July, 1912. President Joseph Swain, who is chairman of the committee, will read a proposed resolution.

JOSEPH SWAIN, Swarthmore, Pa.: The members have printed copies of the report. I wish to quote a few paragraphs from the report. We ask the passage of the following resolutions:

Be it resolved, I. That the National Education Association approves the proposed International Commission on the Cost of Living, and authorizes the Committee on Teachers' Salaries and Cost of Living to take all proper steps to bring this matter effectively to the attention of Congress and the President of the United States.

II. We also ask the passage of a resolution to be presented Wednesday, July 10, providing the necessary financial means for the continuance of the work of the committee as outlined above, and for the publication and distribution of the data thus secured.

Mr. GREENWOOD: I wish to move the adoption of the resolution read by President Swain, if the motion is in order.

PRESIDENT PEARSE: The motion is in order and is seconded. I am asked by President Swain to recognize two members of the committee, Miss Strachan and Miss Haley.

GRACE C. STRACHAN, of New York City: At the request of President Swain I wish to say a few words in regard to this resolution: That a further appropriation of three thousand dollars be made to conduct this work. I suppose the fact that for six years we have been working for better salaries for teachers justifies my asking your support of this resolution. We are not afraid when we speak of salaries that we shall be accused, as teachers, of speaking only of our pocketbooks. I think everybody who gives the matter a moment's thought realizes that the teacher will do his best work when not oppressed by the weight of extra work in connection with the struggle to make both ends meet.

The other parts of the work submitted to this committee, those dealing with tenure and pension, I think are of vital interest to every member of our profession. During the six years' fight by sixteen thousand women in the city of New York, I am probably the only woman who feared that she might lose her position. You can, therefore, understand that the New York teachers can be independent and can wage a fight in opposition to their own board of education and all others. In New York City we have secured by act of legislature security of tenure. Any teacher who has completed three years of service that is recognized as satisfactory is sure of his or her position and cannot be removed except on charges, and those charges must be general inefficiency, insubordination, or gross misconduct. You will be interested to know that for some years marriage seemed to be considered gross misconduct. The board of education had in its by-laws said that when a female teacher married the act constituted resignation. That went on and was obeyed by hundreds of female teachers for years, and then a teacher married who thought, "Why do I lose my position? The state law says that I shall not, since I have a permanent license, unless guilty of general inefficiency, insubordination, or gross misconduct." So she got a lawyer and took the case to the courts. The records showed that she was very efficient and so there was nothing that she could be charged as guilty of, except of gross misconduct. The judge, I believe, was a married man. You can readily see what the result was. So, now, teachers can marry and remain in the system if they choose to do so. The reason that my position was not secure is that I was elected for a term and my term expiring during the fight, the board might refuse to re-elect me.

I mention the tenure because I think one of the most desirable positions, especially in a teacher, is that of being free and independent and you cannot be free and independent and stand for your ideals and your position if you fear losing your position.

The matter of pensions needs no explanation or advocacy. We all realize that our profession is one that limits us generally to a salary which, as yet, is very inadequate and therefore we should be protected in the future of our lives after giving up teaching, so that we need not worry. I therefore hope that there will be a unanimous support given to the resolution offered by President Swain.

MARGARET HALEY, of Chicago: Mr. President and members of the Association: I am sure that the Chicago teachers rejoice with the teachers of the United States that it is in our city that we receive the first report that has come before the National Education Association—I mean the Association as a whole—on this question of salaries, tenure of office, and pensions. The resolution creating the committee was presented at San Francisco last year and we who have been working for more than ten years to get this resolution before the National Education Association rejoiced when it passed. We rejoice this morning to see the unanimity that we have in the approval of the report and the extension of the work as proposed. I believe there is no subject today that needs more attention from educational bodies than the question of the teachers' condition of living and working. I believe our first duty is not the expounding of theories, but the finding of better conditions for the people who are trying to improve the conditions under

which our teachers work. Our reports show that the standard of living and therefore the standard of efficiency of the teaching force has been lowered. When you lower the standard of living you lower the standard of efficiency and the public schools are suffering with the teachers. We hope that you will adopt this report and that you will not only adopt the report, but that you will also bring to the attention of the teachers of the United States, when you go back, the fact that this National Education Association has taken up the subject of tenure of office, pensions, and other questions vitally connected with living; especially the question whether the increase in salaries has kept pace with the increase in the cost of living.

I feel that you understand this question so well that I need say no more, except a word to urge the teachers to bring these subjects before your officials, your board of education, and thus complete a great and splendid piece of work. I thank you.

PRESIDENT PEARSE: You have heard the motion of Mr. Greenwood to adopt the resolution of Chairman Swain. He informs me of his knowledge that the Committee on Investigations and Appropriations will have no further meeting during the session. You have heard the motion, which motion has been seconded and has been spoken to by Miss Strachan and Miss Haley. If there are no further remarks, those in favor of the adoption of the motion will say Aye.

The motion was carried unanimously.

PRESIDENT PEARSE: The next item on the program is the report of the Committee on Nominations, of which President Robert J. Aley is chairman.

MISS BLAKE: Before that report is made I request that the unfinished business come before this house. It is customary in most organizations—I think parliamentary practice will prove that I am right—to transact all business before electing officers. I ask this because I should like to have a chance to show exactly where we stand on the By-Laws. I move, Mr. President, that we take from the table the By-Laws that were presented at San Francisco last summer.

The motion was seconded by various members.

PRESIDENT PEARSE: The motion has been made and seconded that we depart from the regular order, the order which is customary in the National Education Association business meeting, and that we now take up the item of unfinished business.

WILLIAM H. CHAMBERLIN, of Chicago: I beg to offer this suggestion, that these By-Laws are quite extensive in the amendments proposed. There will no doubt be debate. It is a question whether we can reach a conclusion or a vote on these proposed amendments in today's session. Some of them may have to go over to another session. It appears to me that the election of officers would be the better procedure and I move that this motion be laid on the table.

The motion was seconded.

HANNA WEHLE, of New York City: There is a motion before the house now, and I rise to a point of order.

PRESIDENT PEARSE: A motion has been made to take up the unfinished business out of its order. The Chair will rule that this special motion to lay the first motion upon the table is in order. The motion to lay on the table is not debatable. As many as favor the motion to lay on the table will say Aye. Those opposed will say No. The motion to lay on the table appears to be carried; it is carried. We will now have the report of the Committee on Nominations.

ROBERT J. ALEY, of Orono, Me.:

To the President and Active Members of the National Education Association:

Your Committee on Nominations presents the following report:

For *President*	EDWARD T. FAIRCHILD	Kansas
For *Treasurer*	GRACE M. SHEPHERD	Idaho
For *Vice-Presidents*	CARROLL G. PEARSE	Wisconsin
	GUY POTTER BENTON	Vermont

For *Vice-Presidents*	Martha Stromberg	Maryland
	Waitman T. Barbe	West Virginia
	B. W. Torreyson	Arkansas
	Helen M. Wixson	Colorado
	L. R. Alderman	Oregon
	Agnes E. Howe	California
	Ada Van Stone Harris	Virginia
	Amelia C. Fruchte	Missouri
	Cornelia S. Hulst	Michigan
For State Directors:		
Alabama	John H. Phillips	Birmingham
Arizona	A. J. Matthews	Tempe
Arkansas	George B. Cook	Little Rock
California	A. J. Cloud	San Francisco
Colorado	James B. Ragan	Sterling
Connecticut	Walter D. Hood	Winsted
Delaware	George W. Twitmyer	Wilmington
District of Columbia	William M. Davidson	Washington
Florida	Clem Hampton	Tallahassee
Georgia	Aubrey Matthews	Gainesville
Idaho	Walter R. Siders	Pocatello
Illinois	William H. Campbell	Chicago
Indiana	Thomas A. Mott	Richmond
Iowa	O. P. Bostwick	Clinton
Kansas	John MacDonald	Topeka
Kentucky	J. G. Crabbe	Richmond
Louisiana	T. H. Harris	Baton Rouge
Maine	Robert J. Aley	Orono
Maryland	Charles J. Koch	Baltimore
Massachusetts	Robert J. Fuller	North Attleboro
Michigan	E. E. Scribner	Ishpeming
Minnesota	Julia H. Vaughan	Minneapolis
Mississippi	E. E. Bass	Greenville
Missouri	William P. Evans	Jefferson
Montana	Ward H. Nye	Billings
Nebraska	James E. Delzell	Lincoln
Nevada	Walter J. Hunting	Carson City
New Hampshire	Henry C. Morrison	Concord
New Jersey	Calvin N. Kendall	Trenton
New Mexico	W. E. Garrison	Agri. College
New York	George M. Forbes	Rochester
North Carolina	F. M. Harper	Raleigh
North Dakota	George A. McFarland	Valley City
Ohio	J. F. Smith	Findlay
Oklahoma	W. A. Brandenburg	Oklahoma City
Oregon	Grace DeGraff	Portland
Pennsylvania	Reed B. Teitrick	Harrisburg
Rhode Island	George F. Weston	Providence
South Carolina	D. B. Johnson	Rock Hill
South Dakota	C. G. Lawrence	Pierre
Tennessee	J. J. Keyes	Nashville
Texas	William B. Bizzell	Denton
Utah	G. N. Child	Salt Lake City
Vermont	Guy Potter Benton	Burlington
Virginia	Maurice M. Lynch	Winchester
Washington	C. E. Beach	Olympia
West Virginia	M. P. Shawkey	Charleston
Wisconsin	L. P. Benezet	La Crosse
Wyoming	M. E. Shuck	Rawlins
Hawaii	Willis T. Pope	Honolulu
Philippine Islands	G. N. Anderson	Manila

Respectfully submitted,

Robert J. Aley, *Chairman*

A Member: Mr. Chairman, I move that the Secretary be instructed to cast the ballot of the Association for the officers named by the committee.

The motion was seconded.

PRESIDENT PEARSE: You have heard the motion as made and seconded.

MISS BLAKE: Mr. President, I wish to enter objection to that motion. One objection will stop that motion, I believe.

PRESIDENT PEARSE: Yes.

MISS BLAKE: I desire to make a motion to substitute in place of the name of Mr. E. T. Fairchild of Kansas the name of Miss Grace C. Strachan, of New York.

Many seconded the motion.

PRESIDENT PEARSE: You have heard the motion to amend.

MISS BLAKE: I wish to speak on my motion before a vote is taken. I think that Americans as a rule stand for fair play. I feel proud, friends, very proud, that two years ago I had the honor of nominating in Boston your own superintendent and of making before the audience of active members of the Association the nomination of Mrs. Young as President of the Association. You found then that the only way that the name of a woman for a high office in this Association could be brought before this body was by a substitute motion. We were told in San Francisco that the only way that a woman's name could be brought before the body was by a substitute motion and it was so proved. We have been told here that the only way that a woman's name can come before this organization is by a substitute motion and it has again so been proved.

A MEMBER: No, it has not been so proved.

MISS BLAKE: I said for a high office. In presenting Miss Strachan's name here I present the name of the member who has done the biggest piece of educational work that has been done for a long time. In gaining equal pay for the teachers of New York City she gained what is far greater than a political victory—an economic victory. As the representative of the teachers of her own organization she, more than anyone else, accomplished that work. In her report this morning she was too modest to tell you that she was the only one of the members of that organization who stood in any danger. She did not tell you of the abuse and threats that met her in that work. She refrained from saying to you that in order that this great work might be carried on, and because she was standing for a principle, she worked against an increase of salary for herself. For the past three years she has received $1,000 a year less than she would have received had she worked for herself instead of for the classroom teachers. I think that is a record that is pretty hard to match. It was Miss Strachan alone of all the district superintendents who stood for the continuance of the $5,000 salary instead of for the raise to $6,000, because she would not have her salary raised until the classroom teacher received adequate compensation for her work.

Friends, in presenting the name of Miss Strachan, I present the name of a leader in educational affairs. This organization needs a leader into new paths. Miss Strachan can be that leader. In the schools she has always been a leader; in school associations she is a leader, and she has been a leader in the charity work of her city. She has the mind to grasp new issues and to meet them.

Things have been said here which I think you will all deplore later, because intentions have been misinterpreted. In the heat of debate even friends sometimes misunderstand each other. Miss Strachan has not been asked for her position on the By-Laws. It was for that reason that I tried to bring the By-Laws before you a few minutes ago, so that you could hear from her own lips where she stood. I am sorry that you did not vote to allow her. I am sorry that you were unwilling to discuss the By-Laws and thus give her a chance to show you her attitude in reference to them.

Friends, Miss Strachan stands not merely for the uplifting of the teacher thru her salary. She has under her care thirty thousand children in New York City. She has one of the most progressive districts, one of the best districts in the city, and one of the freest. Her teachers are happy and enthusiastic under her. They are free to do as they like. Initiative is not repressed. Miss Strachan stands for individual liberty, for the friendly

comradeship of teacher and child. In her district, if you choose to visit it, you will find classes for the blind, for the anæmic, for the crippled, for the deaf, for the defective, as well as the most advanced and progressive work for the normal child. Miss Strachan is a leader in the vanguard of school work. In asking you to give your votes for Miss Grace C. Strachan today, I am asking you to do honor to this body. I am not asking you to honor her—she needs no further honor. This Association is coming, to a certain extent, to the parting of the ways. We must in the future travel a different path from that of the past. You need a wonderful organizer. In Miss Strachan you have a wonderful organizer. She has organized the biggest teachers' organization in the world, with a paid-up membership of fourteen thousand members in it. Miss Strachan has worked in harmony with friends, and with people who seemed not like friends, in New York, and has brought order out of chaos and we want votes for her for that reason also.

I nominate Miss Strachan for the presidency of the greatest educational organization in existence today, and I so nominate her hoping that this National Education Association will not fail to elect her and that the women of this organization will honor themselves in honoring her.

Thomas W. Bicknell, of Rhode Island: Mr. President, there are a few points concerning which I wish to say a word. I have met here today a great many members whom I have never met before and I congratulate the Association upon its splendid condition and its splendid prospects for the future. Among those distinguished people who have come to my attention has been Miss Grace C. Strachan, of New York; of great ability, of great organizing power, and of great strength in very many directions, and if she lives and if this Association lives, it is certain that she will stand at its head. But today, as a friend of this lady so distinguished, I, for one, representing the past of the Association as well as the present, feel that the hour has come for a continued policy along the lines laid down by those who have led in the past and who have been great in service to this Association.

Miss Strachan appears for the first time here, and she is a splendid representative of our work and of her own efficiency. But I think that in our present position she, as a leader, can afford to wait; that she had better wait for another time and another occasion. My voice and my influence at some time in the next few years will be raised for her; but I believe that we should recognize the regular order of procedure at this convention. I believe that the report of this regularly appointed committee which we have named from the many states should be adopted.

Miss Blake: There was to be a minority report, but we have moved to amend the majority report. I have the minority report here.

Mr. Bicknell: The majority report recognized one of the great men of the states; and his name stands known and recognized. I, for one, feel it my duty to say that while I would most gladly vote for Miss Strachan under other conditions, under the present conditions I must vote for Mr. Fairchild, of Kansas.

There were calls for "the question"; President Pearse asked if there were any other remarks.

Mathilde C. Ford, of the Department of Finance, New York City: Like my friend who has just spoken, I too have been facing the past until a few weeks ago when I stood on Fifth Avenue and watched the women parade. Up to that time I had never had any enthusiasm over the suffrage movement but as I stood there I felt myself quivering with emotion and seemed to have a vision of the women of the future. And so I leave my chair and come forward to speak a word for Miss Grace C. Strachan because she, more than any other woman whom I have met in my far-reaching contact with the teachers of this country, seems to represent this new and coming order of things.

Being outside the school system and therefore able to speak impartially, I desire, with Miss Strachan's permission, to make one or two apologies. It is rather a delicate task but I feel that in the light of all that has happened it is due to our friends in Chicago.

First, I want to apologize for Miss Strachan's having called upon His Honor the Mayor, and in explanation to say that at home she is so accustomed to associating with the mayor, the governor, and the members of the legislature that she did not deem it a crime to call upon the mayor when she came to Chicago.

If my dear friends, the New York teachers, will forgive me, I desire to offer an apology for them also. I had never attended a meeting of their Interborough Association of Women Teachers until three weeks ago when a representative from Chicago came to New York to ask Miss Strachan to withdraw from this race. After hearing what this representative had to say I asked permission to attend a special meeting of that association which had been called to consider the matter. It was granted. We are more generous in many ways—pardon me—than you are in Chicago. I could not get into the caucus where your deliberations were held, but since coming into this meeting I have been called outside and taken behind the curtain. I said, "Come out into the open, we don't do business in New York behind a curtain." In educational politics as well as in national politics, the time has come when nothing short of publicity will win. Publicity is the corrective force in the social body and I predict that from this time on no candidate, whether in a political or an educational convention, can win by any other method than full and free publicity.

To continue my story, I attended the meeting of the Interborough Association and heard Miss Strachan assert that she did not want to be a candidate for the presidency of the National Education Association. She is not seeking honors. She is overloaded with them at home. How, then, does she come to be a candidate? Let me tell you. I have witnessed a quickening of the spirit in the educational world during recent months and I came to this meeting hoping to find it in evidence here. The moving picture is destined to become the greatest educational instrument since the invention of the printing press. The Montessori method of which we heard yesterday is going to revolutionize the work of teaching young children. Now it would appear that Miss Strachan has invented a Montessori method of handling teachers. She keeps herself in the background and allows them self-expression. They said, "We want you to be a candidate; we want you to go to Chicago as the representative of the teachers of New York City." If there has been any lack of finesse on the part of these young women who have conducted her campaign it has been because they were expressing their new-found freedom without interference.

In presenting the name of Miss Strachan for President, we also desire to apologize for her not having been active in the Association for the past twenty-five years. It is not her fault that she is not old enough for this. Despite her alleged lack of years, she has done most extraordinary educational work and to an unprecedented degree she has become a leader among women. And so I ask you to vote for her.

Calls for "the question."

PRESIDENT PEARSE: The Chair feels that the Association—altho it is warm and altho we have much business—can afford to take a few minutes more. We can well afford to be courteous to the sisters from New York. I believe that Miss Stromberg desires the floor. She shall have it unless the house forbids.

MARTHA STROMBERG, of Baltimore, Md.: Mr. Bicknell acknowledges Miss Strachan's great abilities, but he says, use them in the future. Why not use these great abilities at once? Why put off for tomorrow what you can do today? Everybody acknowledges that this is a time when we need great talent. Why not then use all this great talent and these great abilites of Miss Grace C. Strachan?

PRESIDENT PEARSE: The Chair desires to state, in the matter of the publicity which has been referred to, that every arrangement has been made to procure the fullest publicity for the proceedings of this meeting; as an evidence, please notice the representatives of the press of the nation, seated at my left.

MARY O'REILLEY, of Chicago: I ask for the floor to say that the teachers really

have not heard all that they want to hear. I, for one, would like to hear from the candidates and how they stand on the amendments. I hope that the house will not call for the question and will not cut off debate until we have heard from Miss Strachan and from Mr. Fairchild on the amendments. We are not here to vote on anybody's personality. It has been said that Miss Strachan has not had an opportunity to declare herself on the amendments.

MISS HALEY: I rise to a point of order.

PRESIDENT PEARSE: State it, please.

MISS HALEY: The point of order is that the question as to how the candidates stand on these amendments is not a pertinent question at this time. The subject of the amendments should come later.

PRESIDENT PEARSE: Will Miss O'Reilley continue?

MISS O'REILLEY: I continue in my request that the members of the organization should be allowed to know how the candidates stand.

MISS STRACHAN: There are some things that I think should be explained before any vote is taken at this meeting. Somebody said to President Pearse that she wanted Miss Strachan to speak this morning. He inquired, "In advocacy of her own election?" I am not speaking "in advocacy of my own election." Those who know me know that my chief desire always is for *truth*. So many things have been said, so many charges made—in the press and elsewhere—that I want to clear the atmosphere, if possible, by stating some facts. I do not want any person to vote for me who has the slightest doubt as to the truth of these charges.

I am sorry to say I am not so young as Mrs. Ford thinks I am. I first attended a convention of the National Education Association in 1891, twenty-one years ago. I have attended many of the conventions since. No doubt in those early years, like so many of the women members, I was an associate member. But I have attended conventions. I went to see if I could find anything better about the teaching of mathematics, to see what I could learn about the exceptional child, and so on. I confess that, altho according to the *Yearbook*, I have been an active member since 1903, I have never spoken from the platform at the business meetings except in 1910 when I took the platform to advocate the election of Mrs. Young, of Chicago. I do not regret that action. Miss Blake, of New York, had in obedience to the instruction of the New York committee in Boston, made the minority report in favor of Mrs. Young. I took the platform to second it. As you know, the report of the nominating committee was set aside, for the first time in the history of the Association, and Mrs. Young was elected. If for supporting her in that convention I am—as has been charged—the candidate of the "Old Guard," I must acknowledge that the "Old Guard" is very generous.

When I went to Boston I went simply and solely, I confess, to work for the election of Mrs. Young and I took New York teachers with me for that purpose. Our Association had appropriated money enough to send ten of us to Boston and pay our expenses there for that purpose. Beside that, we had sent to every school in New York—and there are 520 of them—a letter requesting teachers to go to Boston and aid in the election of Mrs. Young of Chicago; and I am told that there were eighty of us there from New York City. I felt that since the majority of the members of this Association were women, and that since the greater part of the money in the treasury of this Association was contributed by women, it was not asking too much that for the first time in forty-eight years the Association elect a woman President.

I apologize for nothing that was done in Boston by the New York committee. I apologize for nothing that was done in connection with setting aside the report of the nominating committee. We come here to Chicago two years after—I did not attend the convention last year at San Francisco because the legislature in Albany was in session and I remained home to do important work there, but we got up a special party to go to San Francisco to work with Mrs. Young and Miss Blake and the people who have become

known as "Progressives." Now, in Boston, I did not stop to ask, "Are you a member of the Old Guard?" or, "Are you a Progressive?" I did not know who was which, and I did not care at that time. I was there to put into the office of President the person who I thought was best fitted at that time for that position. I do not think that the National Education Association ought to continue this division, if there is one, between the "Progressives" and the "Old Guard." This is a professional association, not a political association. I never heard in Boston about the "Progressives" or about the "Old Guards." I never thought of members as such.

A member of the Hospitality Committee here said to me: "I hope that you are enjoying your stay in Chicago." I said, "I am Scotch-Irish and I am blunt and so I tell you that I am not, and that I think I am not being fairly treated." He said, "How is that?" I said, "I hear indirectly that there is a caucus of the Chicago Principals' Club here at four o'clock. Now, I am the regularly elected director for the state of New York—the state that has the greatest number of active members in this association—and it should not be a question as to whether I am Grace C. Strachan, or whether I am mentioned for office here; but if there is a conference, I should be notified of that and given the privilege either of attending or staying away." He said he was sorry that I felt that way. I confess now I am sorry that I came to Chicago. I would have had a much finer opinion of many people in Chicago if I had stayed away.

However, some members of the New York delegation attended the caucus in the Chicago Principals' Club and the statement was made there, either by President Hall or by Mr. Owen, "Chicago controls the situation. We have—I don't know the exact number of active members—nine hundred or a thousand and if necessary in half an hour can make that figure six thousand." Whereupon one lady who was there said, "Then we'd better change that 'N' in the N.E.A. to 'C.'" Some one made the retort, "If you have the convention in New York, I suppose it will be the 'I.E.A.,'" referring to the Interborough Association of Women Teachers of which I am president. I hope that I have influence enough with my fourteen thousand to prevent their degrading the National Education Association by making it in its business conduct or in its educational departments a catspaw of any local organization in what happens to have been chosen as the meeting-place. For fear that I might not have such control, I shall work hard, if I continue in this Association, to prevent the meeting of the National Education Association in the city of New York or any other large city.

As one of the speakers has said, I was not a willing candidate. I do not seek honors. I accomplished something for teachers that I set out to do, and many thought that I was therefore the logical candidate for the presidency of the National Education Association. Such was my feeling until three weeks ago Sunday. Then a lady came to New York —I am noted for being very frank, it was Miss Haley—and said to Miss Blake and myself and four others at a luncheon at the Waldorf which I had arranged—you need not be in the dark, anything that I do I am perfectly willing to talk about—this lady said, "The National Education Association committee of the Chicago Principals' Club has considered Miss Strachan as a possible candidate for the presidency this year, and has decided that it would be unwise." I do not know how many here will understand why I resented that.

I resented it because Miss Blake, who certainly has fought shoulder to shoulder with "Progressives" since there has been any such name for any portion of this Association, both as Treasurer and as member of the Executive Committee, had not been taken into any conference which should come to that decision. If Miss Blake had come to me and said, "You know, Miss Strachan, that for three years I have been wanting you to be President of the National Education Association, but President Pearse and Mrs. Young and myself, and maybe others, have been talking over the interests of the Association and we have decided that it would be better not to name you this year," I should have been very thankful, very thankful. But to be informed that a club—I am sure I don't know how many members there are in it—the Chicago Principals' Club—I am told that there are men and

women in it, and I am told that Mr. Hall is president—that a very small club consisting of a very small proportion of the membership of the National Education Association had decided whether I could be nominated as a candidate or not, was not to be tolerated. Now the Chicago Principals' Club arrogates too much to itself—you see I am seeking the Chicago vote. Not only does it assume the right to say who shall be the candidate this year, but it has also decided who shall be the candidate next year; and they say I am to be the candidate next year.

The statement has been made over and over again by Chicago teachers to New York teachers that Miss Strachan is against the By-Laws, that Miss Strachan won't say that she is for these amendments, intimating that that has biased their opinion on the presidency. Now that is not true. Miss Haley reported the decision of the Chicago Principals' Club before she showed us the amendments to the By-Laws. Now, how could I have passed my opinion on the amendments to the By-Laws when at that luncheon it was said what the Chicago Principals' Club decision was, before I had had opportunity to pass upon these amendments? When asked why the Chicago Principals' Club had decided Miss Strachan could not be President this year, she said, "The Chicago Principals' Club is very much interested in the By-Laws, but it feels that it should not ask too much." Miss Blake said, "I don't know why the candidacy of Miss Strachan should conflict with the By-Laws," and she said, "Chicago does not feel that it should upset the report of the nominating committee." I said, "That is really funny, coming from Chicago." "However," I said, "let us hurry up with this luncheon and get to those By-Laws. They must be very serious." And we spent the rest of Sunday afternoon studying the By-Laws, or as much of them as we could get into the time.

I suppose I should not talk about By-Laws. Probably I shall be declared out of order. However, the first one is one that was presented by a New York teacher at San Francisco. It is not doubtful what my attitude would be on that. Ever since coming to Chicago I have said to every New York teacher that I could reach, "You must not say what my attitude is on the By-Laws; I will not enter into even the semblance of a deal. I do not want the presidency of this Association so much that I will get it thru any deal. For you to say that you will be for the By-Laws if they will be for me as President is not in my line of conduct in any campaign."

But, however, that is aside from the subject because this decision by the Chicago Principals' Club antedated any discussion of the By-Laws to which I was invited. These amendments to the By-Laws were in press before the messenger came to New York.

Now, here, at that caucus Saturday, it was decided that there should be a caucus on Sunday night at eight o'clock and three men were selected to get attendance at that Sunday evening caucus. One of them happened to be Mr. O'Donnell of New York. I do not know whether that is the reason that that caucus was abandoned. When people went to the Chicago Principals' Club Sunday night at eight o'clock, they found a notice on the door, "Caucus abandoned by mutual consent." I do not know by whose mutual consent it was. Neither do I care, except that I regret that the conduct of the National Education Association has to be decided in caucuses. We learned on Monday morning that later on Sunday night there had been a caucus. We were informed that seventeen states were represented. I assure you that New York was not asked to have a representative there, but it would have been very glad to have had a representative there. There is so much mystery that we cannot find out what states were there.

A MEMBER: Oklahoma was one of them.

MISS STRACHAN: Oklahoma is likely to be in the forefront of everything. However, a Chicago woman member said to a New York woman member after the caucus, when asked if Miss Strachan's name was there presented, "No." Then the New York member said, "Then you asked only those who were opposed to Miss Strachan. But suppose Miss Strachan's name was presented at the annual meeting, could you not vote

for her?" and the Chicago member said, "No, I cannot vote for her because we pledged ourselves at that caucus to vote for Fairchild." It seems to me very much like the unit rule at Baltimore.

If the report of this nominating committee had been made without these previous irregular caucuses, notice of which was not sent to every state headquarters, I possibly might not even have asked for the privilege of explaining some things and would let this active meeting go ahead and vote, even if it were voting in the dark. But I have the reputation of liking the truth, and for wishing to clear the atmosphere, and I do not want any woman or man to vote for me today if she or he stands any way in doubt as to the advisability of doing it.

The silly accusations that are made with reference to my calling on your mayor seem beneath notice. There have been apologies made here this morning for various things. I think that I shall have to apologize to our splendid mayor, Mayor Gaynor, for innocently dragging his name into the inane tactics that seem to permeate this Association. I do not wish Mayor Harrison to have a wrong impression. The papers last week said that I had gone to ask Mayor Harrison to ask Mrs. Young to get the Chicago teachers into line to vote for me. When I saw Mayor Harrison, Miss Blake was with me—Miss Blake, Miss Bayer, Mrs. Ford, and Mrs. Moriarity. We invited him to our reception last night. In Boston the New York committee got up a reception in honor of Mrs. Young, and I with a member of our committee went down to the City Hall to ask Mayor Fitzgerald to attend—to attend the reception in honor of Mrs. Young—and Mayor Fitzgerald did attend and stood nearly two hours in line.

Mayor Harrison said he was sorry we did not ask him sooner. I have since learned that there are some differences in opinion between the Mayor and teachers here.

Again I saw my name associated with the book trust. I have been a superintendent for twelve years; I suppose I might influence the selection of books in my schools. But I should not be afraid to ask every principal, man or woman, that I have ever supervised to take oath as to whether I have ever said, "I wish you would favor so-and-so or would not favor so-and-so." I have no doubt that there are some men connected with book firms who will vote for me. One is the head of the firm of D. C. Heath & Co. He is one of two men at this convention who are privileged to call me Grace. They are privileged by an acquaintance with my people for over twenty years. I know that even some A.B.C. men voted for Mrs. Young. Therefore I am ready to put on record the active members of this Association as to whether they wished to vote for me as the President this year or not. I do not plan for next year. There are hundreds of men and women who went down on the "Titanic" the other night when they thought they were having a party. How foolish it is for any Chicago Principals' Club, for any "Old Guard" or for any "Progressives" to say what we shall do next year.

A MEMBER: I move the previous question.

The motion was seconded by several members.

PRESIDENT PEARSE: It has been moved and seconded that the main question be now put.

MISS BLAKE: I rise to a question of personal privilege. In voting for this, you are voting for the next President of the National Education Association. Mr. President, I have been here for some time and I have heard again and again the statement that Chicago does not want to control this Association. I would request, therefore, that this vote be as it should be, by ballot, and that our Chicago friends who are so willing to let the rest of the country decide and do not want to control, refrain from voting.

Mr. President, I am afraid that that request is misunderstood, I say that I demand that it shall be by ballot, so that no one can be prevented from voting as his or her individual inclination determines.

The Chair ruled that the question of the form of vote and whether by ballot or not should be passed upon by the house at the close of the debate.

MARY A. O'CONNOR, of New York: I seek information. My question is this: In voting on the previous question I should like to know what the vote will be. The second is, What action is necessary with the present motions before the house, and with the present amendments. to obtain the individual vote of this Association on the President?

PRESIDENT PEARSE: The ruling of the Chair is that the first vote is on the previous question—that the questions before the house be put to vote without further debate. After this has been decided, if it is decided in the affirmative, the questions will be put, in their proper order.

MISS BLAKE: Will the Chair state again what will be the result? The first ballot is on the previous question; and if the previous question be ordered when the vote is taken, the debate will cease and the questions before the house will be voted upon in their order; first the amendment, then the main question with or without amendment, as may be decided.

PRESIDENT PEARSE: The first motion was that the Secretary be instructed to cast a ballot for the nominees of the committee—those named in the report of the nominating committee. This was objected to. The question was then on the motion that the report of the Committee on Nominations be adopted. An amendment was made that the name of Miss Grace C. Strachan be substituted for the name of Mr. E. T. Fairchild. Those are the two motions before the house. The unanimous ballot of the house cannot be cast if there is a single objection. The first motion is, Shall debate cease and shall the motions pending be put before the house? If debate ceases, we shall then vote upon the motion to substitute, and then upon the motion to adopt the report of the committee, with or without amendment. Shall the main question be now put?

The motion to close the debate was carried.

PRESIDENT PEARSE: We come now to the vote upon the first question: Shall the name of Miss Grace C. Strachan be substituted for that of Mr. E. T. Fairchild in the nominating committee's report? As many as favor this motion say Aye. As many as oppose it say No.

The vote having been taken by Aye and Nay vote, President Pearse declared that the motion to substitute was lost.

A rising vote was called for.

MISS BLAKE: I will ask for a ballot. It is not fair to ask for people to stand up and be counted when their superior officers do not want them to be counted.

PRESIDENT PEARSE: The vote will be taken as indicated unless there is a different order from the house.

MISS BLAKE: I move that the vote be taken by a ballot.

The motion was seconded.

MR. BICKNELL: I believe that we are proceeding with a ballot and no business can be intruded during that order.

PRESIDENT PEARSE: The Chair does not wish to have the members of the Association feel that they are not having all the privileges that they should have. The question has been raised. Unless a ballot is ordered, we shall proceed in the usual order. All those in favor of the motion to vote by ballot will stand; be seated. Those opposed to the motion to vote by ballot will stand; be seated. The motion to vote by ballot is lost by a large majority.

There were calls for fair play.

PRESIDENT PEARSE: Is there any desire that we proceed further in the discussion of this matter?

MISS O'CONNOR: Mr. President, the point made in calling for the ballot is exactly equivalent to calling for the teachers to stand in favor of the ballot. We know that no teachers will stand in the presence of their superior officers, who may object.

The speaker was interrupted by objections and cries of protest thruout the house.

PRESIDENT PEARSE: The Chair must ask for decorum. Let the lady continue her remarks.

MISS O'CONNOR: The question was not answered by the motion. We asked that the vote be taken by ballot in order that no persons might be intimidated, but placing everybody on record by standing in the vote on that motion, is against its purpose. If we should vote by ballot, we should vote by ballot.

PRESIDENT PEARSE: The question has been put to the house as to whether we shall vote by ballot, and has been decided overwhelmingly in the negative; the Chair is not authorized to assume that the members of the Association are not independent units voting their own convictions. We will continue and the vote will be taken in the manner which has been decided upon. As many as favor the motion to substitute the name of Miss Grace C. Strachan for the name of Mr. E. T. Fairchild, in the nominating committee's report, will stand.

Those in favor of the motion stood.

PRESIDENT PEARSE: The Chair will say that he has not asked for a count, because it does not appear to be necessary. If it is necessary, or anyone desires a count, a count shall be made. Those opposed to the motion will stand.

PRESIDENT PEARSE: The "noes" have it. Is it the desire of anyone in the house that a count be made?

MISS BLAKE: May we see the members vote by states?

PRESIDENT PEARSE: If the house orders the vote to be taken by states it will be so taken.

There were calls of "yes" and "no" from all parts of the house.

MISS BLAKE: In fairness I ask that the vote by states be taken, and so recorded.

PRESIDENT PEARSE: The question is called for.

MISS BLAKE: Then, Mr. President, this meeting will ever be under the accusation of being controlled by Chicago.

PRESIDENT PEARSE: The Chair has only one thing to say. If the house wishes a ballot or a vote by states, the house can have a ballot or a vote by states.

MISS BLAKE: If the house—and Chicago.

PRESIDENT PEARSE: At Boston, where action to which reference has been made today was taken, the vote was taken by standing up and being counted and not by ballot. The question now is on the adoption of the report of Committee on Nominations. Those favoring the adoption of the report will stand up; be seated. Those opposed, stand; be seated.

President Pearse announced that the motion was carried and the report of the Committee on Nominations adopted.

PRESIDENT PEARSE: The next business is the report of the Committee on Resolutions.

JAMES W. CRABTREE, of Wisconsin, Chairman:

The undersigned Committee on Resolutions do hereby offer the following declarations and resolutions:

The National Education Association authorizes the Committee on Teachers' Salaries and Cost of Living to take all necessary steps for bringing its findings effectively to the attention of the Congress and the President of the United States, and urges the committee to render assistance in the movement for an international commission on the cost of living.

We reaffirm our belief in the public schoolhouse and the school playground as social and recreation centers for the use of the school and the community under the control and direction of the school authorities.

We heartily approve of the effort of normal schools and colleges to credit toward graduation, work done in biblical history and biblical literature, provided such work is done in compliance with the laws of the state, and provided all organizations are given the same opportunity to offer such work.

Resolved, That the National Education Association urges the National Bureau of Education, and the school authorities of the various cities and states, to join in a well-

directed effort for increasing teachers' salaries to the point where they will be commensurate with salaries in other professions, and in commercial and industrial pursuits, and to join in the movement for more adequate pension laws for teachers in all grades of work.

We heartily indorse the comprehensive plan now before Congress for increasing the facilities in state colleges of agriculture and mechanic arts, state normal schools, and elementary schools for training in agriculture, domestic economy, and other industrial work for the great mass of our people, thru the public schools of the entire country.

The National Education Association again records its interest in the cause of world-peace, which it regards as one of the great educational movements of the age. The Association especially calls attention to the helpful material prepared by the American School Peace League, which is admirably adapted to the school program. The Association commends most highly the active interest taken by United States Commissioner Philander P. Claxton in disseminating information on the subject, especially in his publication of the "Peace Day Bulletin."

The National Education Association regards the present attempt to establish compulsory military training in the schools of the country, not designed primarily for military training, as reactionary and inconsistent with American ideals and standards.

We believe that the time has arrived when Normal Schools and Teachers' Colleges should give adequate courses of instruction in sex hygiene, with the view, ultimately, of the introduction of similar instruction into the courses of study in the public schools.

The highest and best interests of education in all parts of the country, and the further development of all the agencies of education, both public and private, demand such support of the National Bureau of Education, as to enable it to perform in a more vital and effective way the functions for which it was created. We approve the plans of the commissioner of education for bringing together in the bureau groups of competent men and women to study carefully and thoroly the problems of rural education, city school administration, secondary education in public and private high schools, vocational education, school sanitation and hygiene, and higher education, including the education and training of teachers, and the work of the colleges of agriculture and mechanic arts.

We request and urge the Congress of the United States to appropriate for the use of the bureau such sums of money as may be necessary to make the library of the bureau more generally useful, and to make of the bureau a clearing-house for information on all subjects of common and public interest. In the efforts to make the statistical reports of the bureau more complete and accurate, and to publish them more properly, we pledge the commissioner the support of this Association, and urge all officials of educational institutions of whatever kind to give him their hearty co-operation.

In view of the fact that children are often innocent victims of our present unequal and unjust laws, the National Education Association favors a uniform federal law on all questions of marriage and divorce based upon an amendment of the Federal Constitution.

WHEREAS, The great and grave responsibility of the teachers of our country is the training of the youth to realize the duties, rights, and privileges of citizenship; and

WHEREAS, The ability adequately to accomplish this work demands not only the knowledge of the functions of citizenship, but also the right to exercise them, be it

Resolved, That the Association believes in and urges the granting of the right of suffrage to the women of the United States.

WHEREAS, In spite of the fact that our schools have met well the social and economic problems which have confronted us to date, there has been an ever-increasing demand by the public for greater practical proficiency on the part of our pupils of all ages and grades;

WHEREAS, Such liberal education has, in a measure at least, failed to meet this demand in the opinion of those who judge by results; and

WHEREAS, Many of our formerly well-accepted principles, as well as our educational traditions, are undergoing constant and rapid revision, as a result of the more recent scientific investigation and philosophic readjustments, be it

Resolved, That this Association places itself on record as favoring such changes in the courses of study in our elementary and secondary schools, together with such changes in methods of instruction as shall make it possible to assist the pupil in the ready application of such knowledge as he may acquire to actual life conditions.

WHEREAS, Most of our American vocations are laden with "misfits," due largely to lack of wisdom in the choice of a calling;

WHEREAS, Because of engaging in such ill-adapted occupations there exists a lack of enjoyment in work, appreciation of work, and efficiency in work, resulting in economic waste to both the work and the worker; and

WHEREAS, Other agencies than the public schools have failed to deal with this problem, be it

Resolved, That this Association earnestly urges upon the educational people of this country, as well as upon others who are engaged in social work, the necessity for definite progress along the line of vocational guidance for youth; and that such guidance be carried on under the direct control of a vocational adviser, or expert, who shall be appointed by, and subject to, the control of a council of laymen in the several local communities; and be it further

Resolved, That the courses of study in our elementary schools be so enriched as to make it possible to discover the tastes, tendencies, and abilities of the child previous to the time when such vocational decisions are to be made.

WHEREAS, Vocational choice is inseparable from the several vocations to be pursued;

WHEREAS, The public schools have hitherto left these matters to the solution of the worker and the employer;

WHEREAS, The increasing demands of the occupations of the home, shop, and farm are forcing upon local communities the necessity for some form of vocational training; and

WHEREAS, The United States in order to protect its population, by maintaining its vigor and morality; to change its large output of raw material into an output of finished product; to make it possible to fight not with armored cruisers but with brain and skilled workmanship; and to maintain its commercial prestige, demands some form of vocational training, be it

Resolved, That this Association recommends to the federal government the passage of a law, under conditions clearly recognizing the autonomy of the states in adaptation to local conditions, carrying with it an appropriation sufficiently liberal to render possible its operation, which law shall have for its end the ultimate improvement of the home, shop, and farm thru vocational training; that such aid be administered thru the United States Bureau of Education, or a similar body, thence thru the state board of control of each state to the several local boards of control in the several communities; and that such grants to such local communities and to such states be dependent upon actual results secured in such local communities and such states.

WHEREAS, There exists in this country more than four million young men and young women, fourteen to eighteen years of age, who have been denied the privilege of either vocational guidance or vocational training;

WHEREAS, The only assistance which can be rendered to them, or to those somewhat older, is thru systematic instruction in part-time, continuation, and evening schools;

WHEREAS, Besides reports resulting from the appointment of commissions of child study in several of the states, and discussions by students, there exists little definite knowledge of the needs of these persons of adolescent age, while attempts to solve the problems of their instruction are varied and uncertain, be it

Resolved, That this Association authorizes its President to appoint a committee of eleven members, made up of educators, employers, employees, and social workers, to make a special study of this whole question and to report to this Association at a future meeting; and that an appropriation of $500 be granted this committee for its work in connection with said report.

WHEREAS, The complete development of the individual depends primarily upon his health;

WHEREAS, The physical, social, and moral welfare of the community depends upon the continued and permanent health of the citizens;

WHEREAS, The æsthetic interests of the youth are greatly enhanced by constant contact with the beautiful in nature and in life;

WHEREAS, Recent educational movements have recognized more and more the importance of the utilization of the play instinct in the child;

WHEREAS, It is our belief that insufficient consideration has been given this phase of school on the part of those who have the power to provide school grounds and school sites; and

WHEREAS, Such statistics as are available seem to establish the fact that the location of school buildings in large areas of open country enhance the value of land in the immediate vicinity, be it

Resolved, That this Association urges upon all school districts the importance of providing grounds in proportion to the size of the building, not less than a square rod for each child; such a school district park to provide a place for play, and instruction in gardening as well as a place of recreation for all living in the district.

Frequent and gross instances of lawlessness in all sections of our country impress on us the duty of increased attention to respect for law, obedience to authority, and regard for the rights of others as fundamental principles of our social order.

"See to it that the commonwealth receives no injury," is the order of the day to every American citizen and particularly to every American teacher. Our instruction should be so organized and so infused with the spirit of altruism that the ends of good citizenship may be increasingly realized in the products of the schools.

The President of the Association is hereby authorized and directed to enlarge the standing Committee for the Promotion of a National University; and the Board of Directors are hereby requested to make an adequate appropriation for the clerical and other expenses of this committee.

The Board of Directors are also requested to print for use in promoting the movement for a National University, in a separate edition, the four addresses on this subject submitted at the general sessions of this convention.

Respectfully submitted,

Committee on Resolutions

JAMES W. CRABTREE, of Wisconsin, *Chairman*,
WILLIAM MCK. VANCE, of Ohio
FLORENCE HOLBROOK, of Illinois
ROBERT J. FULLER, of Massachusetts
WILLIAM M. DAVIDSON, of District of Columbia
JOHN W. OLSEN, of Minnesota

Motion was made to adopt the report of the Committee on Resolutions. Motion seconded.

A member asked if "suffrage for women" meant the ballot for women; the President referred the question to Chairman Crabtree, who answered that it did. Another member asked that the resolutions be voted for one at a time.

PRESIDENT PEARSE: The suggestion has been made that we vote upon the resolutions one at a time. If it is so moved it will be done. If it is not, the motion to adopt the report of the Committee on Resolutions as a whole will be voted upon.

The motion to adopt the report of the Committee on Resolutions was unanimously carried.

MR. CRABTREE: The Committee has this additional resolution:

Resolved, That the National Education Association appropriate the sum of three thousand dollars, the same to be used, or as much thereof as may be necessary, for the further investigation of the Committee on Salaries, Tenure, and Pensions of Teachers.

Motion was made and seconded to adopt the resolution; which motion was unanimously carried.

MR. CRABTREE: I also offer the following resolution:

Resolved, That the thanks of the Association are hereby tendered to its honored President, Carroll G. Pearse, for the exceptionally valuable program presented at this meeting and for his efficient management of the affairs of the Association during the past year;

Be it further resolved, That the Association hereby expresses its appreciation of the arrangements made and so successfully carried out by the teachers and citizens of Chicago and Illinois for the reception and entertainment of the members of the Association.

A motion was made and seconded to adopt the resolution; which motion was carried unanimously.

J. A. SHAWAN, of Ohio: One year ago at the San Francisco meeting a resolution was introduced approving of the "Uniform Key Alphabet Report," as drawn up by a committee of which I was a member. That resolution was laid on the table for one year. I now move that it be taken from the table and passed by the Association.

The motion was seconded.

PRESIDENT PEARSE: The Chair will say that it is in order to take this matter up at this time. The Chair thinks it only fair to say, however, that this recommendation came to us from the Department of Superintendence with the request that this Associa-

tion indorse it. Since then the Department of Superintendence has reversed its action and withdrawn its former request. The Chair feels that this explanation is due to the members. It is now moved and seconded that this report on a key alphabet be taken from the table and passed by the Association.

The motion was lost.

PRESIDENT PEARSE: The next business is the consideration of the report of the Committee on Revision of the By-Laws; this report was presented at the annual business meeting in Boston, in 1910, and ordered to lie over for one year; it came up for action at the annual business meeting of active members at San Francisco last year, and was, at that time, laid upon the table for one year. It was expected, at Boston, that this report would be printed and sent out among the members so that all might have opportunity to read and study it. However, that was not done by the Executive Committee in time so that any very careful study was possible. It was sent out to members, I believe, about a month or six weeks before the time of the meeting in San Francisco. The members at the annual business meeting there ordered that it be laid on the table for one year. It now comes up as "unfinished business," a report of the Committee on Revision of the By-Laws.

THE SECRETARY: The report was printed and sent out to the members as ordered.

PRESIDENT PEARSE: The members who have just become active members, if I understand the case correctly, have not had an opportunity to receive until today a copy of the committee's report. (Cries of "No," "No.") Former members have received copies sent out by the Secretary. Many, if not all of the active members present, have the report in their hands.

The question now recurs on the report of the Committee on Revision of the By-Laws. What is the pleasure of this meeting? Shall we take up the articles one by one, article by article, and afterward take general action as to the adoption of the revised By-Laws as a whole?

A MEMBER: I understand that the report of this committee must be embodied as a part of the Constitution and By-Laws; and that such a report from a committee must lie upon the table for one year and be printed, as the Constitution provides.

PRESIDENT PEARSE: The Chair will rule: This report that is now before you for action was presented at the Boston meeting, two years ago; it was printed according to the requirements and sent out to all the active members last year; it was also sent to the active members this year. The Chair rules that this is a compliance with the requirements of the Articles of Incorporation and the By-Laws.

JOHN R. KIRK, of Missouri: I want to ask a question as to the extent of the ruling by the Chair. I understand from the Constitution that an amendment which has been offered and is left to lie over for one year may itself be amended, provided the amendment to the amendment does not materially change the substance of the original amendment, and that in some of these "Amendments by Members," which are printed on the white sheet, the substance of the original amendment is undoubtedly altered. I ask whether the Chair rules that all of these amendments in the right-hand column of the white sheet entitled "Amendments by Members" are in order or only those that do not change the substance of the original amendment?

Cries of "Out of order."

PRESIDENT PEARSE: The Chair will say that the gentleman is in order and has a perfect right to raise the question. Under ordinary conditions involving a proposition to make amendments, the amendments must be confined to the specific questions raised; but on the report of a "Committee on the Revision of By-Laws," which had before it all the subject-matter contained in the By-Laws, and has dealt with practically every question touched upon in the By-Laws, all matters contained in the By-Laws, and all matters treated in the report of that committee, come up for action and may be considered. In

connection with new matters which may be offered, the Chair will rule, as the occasion arises for such ruling, as to whether the particular matter offered is within the proper scope and may be considered by this meeting at this time.

D. W. SPRINGER, of Michigan: I move that Article I, as it was proposed at the Boston convention by the Committee on Revision of the By-Laws, be adopted as follows:

ARTICLE I—MEMBERSHIP

SECTION 1. Teachers, school and library officials, educational publishers, and all others actively engaged in educational work, may become active members of the National Education Association of the United States upon the payment of an enrollment fee of two dollars and the annual dues for the current year.

SEC. 2. The annual dues of active members are two dollars, which shall be paid at the time of the annual meeting of the Association, or shall be sent to the Secretary before September 1 of each year. An active member may discontinue his membership by giving written notice to the Secretary before September 1, and may restore the same only on payment of the enrollment fee of two dollars and the annual dues for the current year. An active member forfeits his membership by being two years in arrears, and may restore the same only on the payment of the amount of his arrears and the annual dues for the current year.

SEC. 3. All life members and life directors shall be denominated active members, and shall have all the rights and privileges of such members without the payment of the annual dues.

SEC. 4. The right to vote and to hold office in the Association, the Council, or the departments is restricted to active members of three months' standing whose dues are paid.

SEC. 5. Any person may become an associate member for one year by paying a membership fee of two dollars.

SEC. 6. Eminent educators not residing in America may be elected by the Board of Directors corresponding members. The number of corresponding members shall at no time exceed fifty. They shall not pay any dues.

SEC. 7. The names of active and corresponding members shall be printed in the volume of *Proceedings*, or the *Yearbook* of the Association, with their respective educational titles, offices, and addresses.

A MEMBER: I second the motion.

PRESIDENT PEARSE: It is moved and seconded that Article I as reported by the Committee on Revision of the By-Laws be adopted.

W. B. OWEN, of Chicago: I wish to offer substitutes for the amendments proposed by the committee. These substitutes have been printed along with the amendments proposed by the National Education Association committee and are in the hands of the active members now present. I wish to proceed in as fair a way as possible so as to bring them before the meeting. If the Chair will indulge me I will try to speak to the motion. I wish to say that if the meeting desires me now to take the time and trouble to read the proposed substitute in its entirety, which I offer for Article I, I will read it.

PRESIDENT PEARSE: The motion has been made to substitute. What is the pleasure of the meeting?

Cries of "Read it, read it."

PRESIDENT PEARSE: Read it.

MR. OWEN: May I say also in explanation that a good deal of the matter of the National Education Association committee report has been embodied in the amendments proposed by the Members' Committee, so that you will find much duplication. I am very glad to make this acknowledgment, as I certainly have no desire to take away from the committee any of the credit that is due them. They have furnished a great deal of very valuable material. In order to save time, however, it seems wise that the amendments proposed by members be offered in the form of a motion to substitute rather than as a motion to amend the report of the committee—

Cries of "Hurry up, hurry up."

PRESIDENT PEARSE: Read it.

MR. OWEN (reading):

ARTICLE I—MEMBERSHIP

SECTION 1. Teachers, others actively engaged in educational work, and educational institutions as defined in Section 2, may become active members of the National Education Association of the United States upon the payment of an enrollment fee of two dollars and the annual dues for the current year.

SEC. 2. Educational institutions shall include schools, school boards, library boards, educational publishers, and such clubs and similar organizations as are distinctly educational or have educational departments properly organized with a definite membership.

SEC. 3. Educational institutions as defined in Section 2 may be enrolled as active members and represented by any person regularly connected with, or a member of, the institution, and such representative may exercise all the rights and enjoy all the privileges of active membership, including the right to vote at business meetings; *provided*, That such representative presents a certificate showing that the person named therein has been regularly elected as such representative of the faculty or membership of such institution; but no person shall under any circumstances have the right to cast more than one vote.

SEC. 4. The annual dues of active members are two dollars which shall be paid at the time of the annual meeting of the Association, or shall be sent to the Secretary before November 1 of each year. An active member may discontinue his membership by giving written notice to the Secretary before November 1. An active member forfeits his membership by being two years in arrears. Those who have forfeited or discontinued their membership may exercise the option of renewing the same by paying all arrears and getting the published *Proceedings* of the intervening years, or of becoming members on the same terms as new members. Active members shall be entitled to the published *Proceedings* without coupon or other conditions.

SEC. 5. All life members and life directors shall be denominated active members, and shall have all the rights and privileges of such members without the payment of the annual dues.

SEC. 6. The right to vote and to hold office in the Association, the Council, or the departments is open to all active members of thirty days' standing whose dues are paid.

SEC. 7. Any person may become an associate member for one year by paying a membership fee of two dollars.

SEC. 8. Eminent educators not residing in America may be elected by the Board of Directors corresponding members. The number of corresponding members shall at no time exceed fifty. They shall not pay any dues.

SEC. 9. The names of active and corresponding members shall be printed in the published *Proceedings*, or the *Yearbook* of the Association, with their respective educational titles, offices, and addresses.

A MEMBER: Kindly read Section 6 again, as I think it differs from the way it is printed.

Whereupon Section 6 was again read by Mr. Owen.

MR. OWEN: I move the adoption of the substitute.

MR. SPRINGER: The substitute sections are the same as the National Education Association committee's report with the exception of Sections 2 and 3; Sections 2 and 3 relate to institutional membership, and that question comes before us by reason of the additional amendment which was proposed at San Francisco and which is printed at the end of the report; so that there is nothing in the substitute which was not before us at San Francisco.

MR. OWEN: May I explain, and I think it is due that an explanation be made. The addition of the words "of thirty days' standing" in Section 6, has been made because of recognition of the fact that the setting of a fixed time beyond which new active membership may not be secured, if one is going to vote, at the annual meeting, is the only fair method of regulating the voting privilege.

JACQUES W. REDWAY, of New York: My sympathy is with the spirit of that resolution but I am not in sympathy with the form in which it is put. I am not a corporation lawyer but I have been in corporation councils and in directorates of corporations long enough to know that that matter has been threshed out time and time again, and it has always been declared illegal.

This institution is no longer an independent institution. It is a federal corporation

and organized under federal laws, and any member, any active member whose dues are paid, can call for a review of the actions of this organization in the federal courts.

Now in regard to this thirty days' limit of voting privileges, it disfranchises a member or members and instead of thirty days you might just as well say forty years. I think that matter can be better brought about and in the more legal manner by making them—

Cries of "Out of order."

PRESIDENT PEARSE: The gentleman has the floor; but state your point of order.

A MEMBER: The gentleman is not talking on the point at issue.

MR. REDWAY: I don't think there is a corporation lawyer in the United States who would attempt to defend for one minute, before the federal Supreme Court, a proposition of this sort.

MR. OWEN: I will not undertake to say what a corporation lawyer might do, but if the gentleman will look on page 2 (the pages are numbered at the bottom), he will note that Section 5, in the left-hand column, headed "Charter Provisions," reads as follows:

That the membership of the said corporation shall consist of three classes of members—active, associate, corresponding—whose qualifications, terms of membership, rights, and obligations shall be prescribed by the By-Laws of the corporation. (See Section 5 of Act of Incorporation.)

And it seems to me that gives this body the right to make this qualification and prescription.

MR. REDWAY: I will take issue with the gentleman from the fact that this body has no right whatever to perform illegal acts.

PRESIDENT PEARSE: The Chair will state that in his opinion the amendment as now framed would render it impossible for anyone to vote at the meeting following the time when he paid his membership fee, as the membership now runs from July 1 to the following June 30; it would, therefore, be impossible for anyone to have been a member thirty days, at the time of the annual business meeting of the Association, and so to be entitled to the privilege of voting. If it is the desire of this body to require some particular signification of intention in the matter, the case could probably be reached by requiring that in order to vote, a new member shall have given notice, or made application for membership, not less than thirty days before the opening of the Association year—that is, not less than thirty days before July 1.

MR. OWEN: Perhaps it would be better, in order that the Association may pass upon the matter, to withdraw the words "of thirty days' standing."

A MEMBER: What is the whole question?

PRESIDENT PEARSE: The question now is, Shall we strike out the words "of thirty days' standing," from the substitute as read?

A MEMBER: And have it read as printed?

PRESIDENT PEARSE: Yes, I understand that is the motion before the house, to adopt the article as printed.

A MEMBER: The motion is to adopt the substitute as printed in the pamphlet?

PRESIDENT PEARSE: That is the motion.

A MEMBER: Do I understand the gentleman who presented it that he presents it literally as printed here?

MR. OWEN: Now there is one other change that I wish to call attention to, and that is in Section 4, line 6; the word "one" as printed is changed to "two," and makes it read "An active member forfeits his membership by being two years in arrears."

PRESIDENT PEARSE: That is, two years instead of one. Any further questions?

A MEMBER: Has this thirty days been stricken out?

PRESIDENT PEARSE: It is moved and seconded that the words "of thirty days' standing" be stricken out. All in favor of that signify the same by saying Aye, contrary No. Motion carried.

A MEMBER: I am an active member and I come to the convention next year, and I don't pay my dues; am I still a member, and can I vote?

PRESIDENT PEARSE: You don't quite understand. You remain a member for one year longer; but in order to get your certificate of membership you have to pay your dues; when you get your certificate of membership, and not until then, you can get into the business meeting, and vote. You are not, however, cast off into the outer darkness. Even tho you do not pay your dues for the year, and so are unable to vote, you are still carried as a member.

The motion to adopt the members' substitute for Article I, as amended, was put and carried.

MR. SPRINGER: I move the adoption of Article II as proposed by the Committee on Amendments to the By-Laws as follows:

ARTICLE II—ELECTION OF OFFICERS

SECTION 1. The President, Vice-Presidents, Treasurer, and Directors of the National Education Association of the United States shall be chosen by the active members of the Association, by ballot, at their annual business meeting, a majority of the votes cast being necessary for a choice. They shall continue in office until the close of the annual meeting subsequent to their election, and until their successors are chosen, except as herein provided. The Secretary and the Treasurer shall enter upon their duties at a date which shall be determined by the Board of Trustees and which shall not be later than the first of August, and shall continue in office during the terms for which they are separately chosen and until their successors are duly elected. No President of the Association shall succeed himself in office.

PRESIDENT PEARSE: Do I hear a second?

A MEMBER: I second the motion.

PRESIDENT PEARSE: It is moved and seconded that Article II be adopted as printed.

MR. OWEN: I should like to offer and read the substitute.

PRESIDENT PEARSE: All right.

MR. OWEN (reading substitute):

ARTICLE II—ELECTION OF OFFICERS

SECTION 1. The President, Vice-Presidents, Treasurer, and Directors of the National Education Association of the United States shall be chosen by the active members of the Association, by ballot, at their annual business meeting, a majority of the votes cast being necessary for a choice. They shall continue in office until the close of the annual meeting subsequent to their election and until their successors are chosen, except as herein provided. The Secretary and the Treasurer shall enter upon their duties at a date which shall be determined by the Executive Committee and which shall not be later than the first of October [changed from August] and shall continue in office during the terms for which they are separately chosen and until their successors are duly elected.

I move that the substitute be adopted.

Seconded.

MR. SPRINGER: I should like to know the reason for putting in the Executive Committee instead of the Board of Trustees in Section 1.

MR. OWEN: In making these By-Laws the plan was adopted to give power to the Executive Committee all thru where not in conflict with charter provisions, so that action could be obtained promptly. The Executive Committee, as a body, is elected anew every year by the Association and would be under the immediate direction and influence of the Association, so far as possible.

MR. SPRINGER: The Treasurer is a member of the Executive Committee and thus would be sitting upon his own acts.

MR. OWEN: I recognize the truth of the statement; I think the difficulty could be avoided if the words "Board of Trustees" were substituted for the words "Executive

Committee." I therefore accept the suggestion to substitute the words "Board of Trustees" for the words "Executive Committee."

PRESIDENT PEARSE: The Chair hears no objection; the substitution is made. Moved and seconded that the said Section I be adopted as amended. All in favor of the motion signify by saying Aye, contrary No. Motion carried. What is the further action?

MR. OWEN: I will read Section 2 (reading):

At the annual business meeting of active members, the Association may nominate by ballot and recommend to the Board of Directors one name for member of the Board of Trustees, one name for member of the Executive Committee, and in like manner may nominate and recommend to the Board of Trustees one name for permanent Secretary.

The names of members thus nominated and recommended for the Board of Trustees and Executive Committee respectively shall be certified at once to the Board of Directors by the President and Secretary of the Association, and the name of the member so nominated and recommended for the office of permanent Secretary shall be certified in the same manner to the Board of Trustees.

I move the adoption of the substitute.

A MEMBER: I second the motion.

PRESIDENT PEARSE: It has been regularly moved and seconded that the substitute be adopted. Are you ready for the question?

A MEMBER: I desire to call the attention of the meeting to one word, to the word "permanent." There is no such a thing as a permanent Secretary. I suggest that the word "permanent" be stricken out.

PRESIDENT PEARSE: Is it understood that the suggestion is accepted and the word "permanent" stricken out?

A MEMBER: I think the word "permanent" should be taken out; the Board of Trustees elect a Secretary once in four years; we should not have to go thru the trouble of nominating a Secretary every year.

PRESIDENT PEARSE: As I understand the matter it is the wish of this body that the word "permanent" be stricken out, without further discussion, and I will put it as a motion. Motion carried.

MR. SPRINGER: I should like to call attention to the fact that this term of secretaryship is not necessarily a term of four years. The Board of Trustees may elect for one year.

PRESIDENT PEARSE: For a term not exceeding four years.

MR. SPRINGER: I move that Section 2 be laid on the table for future discussion, as I don't think that under the By-Laws it can be adopted at the present time, and I move that it be laid on the table for final action one year hence.

PRESIDENT PEARSE: The Chair is not sure as to the proper ruling on this; the report of the Committee on By-Laws raises the whole matter as to the By-Laws; but the Chair is not sure as to just the ruling to apply in this case. However, in order not to strain a point, I shall rule that this particular section should be permitted to lie over for one year, and I will let the matter stand in that way for the present, at least.

A MEMBER: The section has been ruled out of order?

MISS HALEY: This matter is proper as a part of "election of officers."

PRESIDENT PEARSE: The point has been made that the matter comes properly under the head of election of officers. This presents a new phase of the matter; the section has reference to the election of officers or to the nomination of them; the nomination is part of the election; the Chair is inclined to rule that this may be considered this year, but the motion is that the section be laid on the table until next year.

MR. SPRINGER: I shall appeal from the decision of the Chair, as I believe the matter cannot be acted on at this time.

PRESIDENT PEARSE: The gentleman appeals from the decision of the Chair and the question now is whether the decision of the Chair shall stand.

E. E. SCRIBNER, of Michigan: State your decision once more.

PRESIDENT PEARSE: The decision is as to the particular question raised by Section 2: "At the annual business meeting of active members the Association may nominate by ballot and recommend to the Board of Directors," etc. The Chair rules that this may be considered since it relates to the election of officers.

A MEMBER: The Chair has changed his ruling?

PRESIDENT PEARSE: This is a change of my ruling.

MISS HALEY: If we cannot consider that portion of the section which has been declared to be new matter, then we may not consider at any time any portion of new matter which was not contained in the report of the Committee on Revision of the By-Laws.

PRESIDENT PEARSE: The Chair has ruled that the section may be considered and there has been an appeal from the decision of the Chair. If it is desired to argue the question, the Chair is ready to listen.

There being no argument, the vote was taken and the decision of the Chair sustained.

A MEMBER: What is the question?

PRESIDENT PEARSE: The question is as to Section 2; a motion has been made for the adoption of the substitute for Section 2, offered by Mr. Owen.

A. S. HALL, of Chicago: I move that Section 2 of Article II be referred to a committee to be reported on at the next annual business meeting of active members.

PRESIDENT PEARSE: Is there a second?

A MEMBER: I second the motion.

PRESIDENT PEARSE: It has been regularly moved and seconded that Section 2 of Article II be referred to a committee for report at the next annual business meeting.

A MEMBER: I wish to make an amendment to the motion that the whole of the section be referred to a committee of five to report at the next meeting.

Amendment seconded.

PRESIDENT PEARSE: It has been regularly moved and seconded that the whole matter be referred to a committee of five to report at the next meeting.

DOMINIC SCHULER, of Wisconsin: It seems to me, Mr. Chairman, that the substitute offered by the worthy gentleman ought to be changed, and inasmuch as it may be necessary for us to give this much thought and consideration, this whole matter should go to a special committee of five, to report at the next meeting.

MR. SCRIBNER: I have listened to the remarks of the worthy gentlemen and it seems to me that we ought not to amend the Constitution and By-Laws hastily. You stated, Mr. Chairman, that a copy of the proposed amendments was sent to every member —every active member of this Association, about a month ago. I must confess that it never came to my attention. I have tried to read the amendments here at this meeting this afternoon. I feel that we have a right to know something about this, we have that right, it seems to me, as members of the greatest educational body in the world, and should give our best thought and attention to changes which may affect vitally the future of the Association. I see no reason why we should hastily adopt changes in the Constitution and By-Laws. Why not deliberate? Why not have these proposed changes printed and sent as soon as possible to every active member for further consideration and have the matter lie over for one year? It does seem to me that in relation to matters of this kind, affecting us so vitally, we should not be required to sit thru all this hot afternoon and consider each article and each section separately. Let us have deliberation. And let us have the proper time in which to do it. I believe that most of these propositions are good. I am inclined to favor all of them but I appeal to this body for deliberation and time in which to give them the consideration which they deserve.

PRESIDENT PEARSE: There has never been a time when the Association did not find itself similarly situated. Whenever it attempted to do business it never had time

enough to do it. We never had time to attend to and dispose of the business of the Association. There were always other matters pressing for attention.

The Chair has been informed that the report of the Committee on Revision of the By-Laws was sent out to the active members last May or June by the Secretary. Now we hear that members did not receive the report. We are interested in the business of this Association and we do not wish to make any changes without due notice or without giving them our best attention. I will ask the Secretary to state whether the committee's report was sent out to the active members.

The Secretary stated that the report was sent out.

A MEMBER: The trouble is that we did not get them in time to give them our consideration.

A MEMBER: It does not seem to me that the members of the committee themselves know exactly what they want in the way of changes and I am in favor of letting this matter go over for one year.

PRESIDENT PEARSE: A lady has been standing; I will recognize her: Miss Howe, of California.

AGNES E. HOWE, of California: I wish to say, Mr. Chairman, that I, as a member of this organization, am greatly interested in it and wish further to say that we have been waiting two years now to have these By-Laws amended, and if they are going to be amended, now is just as good a time to make the amendments as we can find.

MR. OWEN: I wish to say, as the maker of the motion to substitute, that nothing has been presented here today that has not been considered a great many times and been given careful attention.

MR. SPRINGER: I think that the left-hand column here is identical in wording with the blue slip on which the Secretary sent out the amendments proposed by the committee.

MR. OWEN: The blue slip contains the changes proposed by the National Education Association committee.

A. MEMBER: A point of order, Mr. Chairman. By the statement of the Secretary, the only report which a committee has made is contained on this blue slip which I have in my hand; and the makers of the motions to substitute, I observe, are constantly using another.

PRESIDENT PEARSE: I will state that this report was made at the Boston meeting and laid over until the San Francisco meeting; the committee at that time considered itself discharged from further consideration of the matter. We come now to the second year; the chairman of the committee is not present to report. Members of the Association who were not members of the original committee have considered the matter and thought they wished to offer some amendments or substitutions. They prepared these substitutes; they have had them printed; they are presenting them at this time.

A MEMBER: Now can't we listen to a report of the committee?

PRESIDENT PEARSE: The committee's report is before us.

MR. SPRINGER: I moved the adoption of the Article as presented by the committee. Then Mr. Owen moved the substitution of the article as it is proposed by members; you could not make a motion first to adopt that which was proposed by the members because it was not presented to us one year ago. At three points in the reading, as it proceeds, I desire to ask a question of the Chair, as a matter of record, as to whether he rules that matter presented in the recommendations of members is germane. To my mind it is not; and I do not wish the record to be such that we can be subject to criticism in the action we may take on the By-Laws that we now have before us.

Aside from those points upon which a question might be raised, I am going to stop, after moving the adoption of the report of the Committee on Revision of the By-Laws.

MISS BLAKE: I want to suggest that we are not proceeding very rapidly. I would urge the Chair that we continue as rapidly as possible, as I am getting terribly hungry.

The By-Laws are apparently not so important since the election and if we want to make the changes I would like to move an adjournment now and meet again in three-quarters of an hour, at which time we can go on and finish.

A MEMBER: I would just like to say one word at this time. Let us not forget that the purpose of that article of the By-Laws is to require that the amendments to the Constitution and By-Laws shall be submitted one year in advance and printed; that is, to protect this body against By-Laws which have not been thoroly digested by the active membership.

A MEMBER: I rise to a point of order.

FIRST MEMBER: The Chair has already said the matter of this article is germane.

A MEMBER: What is the motion? We are losing sight of the real motion.

PRESIDENT PEARSE: The point of order is well taken.

A MEMBER: What is the question, Mr. Chairman?

PRESIDENT PEARSE: The motion is that Section 2 of Article II be referred to a committee of five and laid over for one year; that matter is now before us.

MR. SCRIBNER: Question!

L. E. WOLFE, of Tennessee: Mr. Chairman, the main question here is, to my mind, a very important one. The main purpose of this Section 2 is to place more power in the Executive Committee and less in the Board of Directors. What does it mean? Simply that the representative body, the directors, coming up from every state in this Union—that their power shall be taken away and given to an Executive Committee—

A MEMBER: I rise to a point of order.

PRESIDENT PEARSE: What is your point of order?

A MEMBER: My point of order is that the matter that was presented by the mover of the motion no longer contains reference to the Executive Committee and the motion was to lay the matter over and refer it to a committee.

PRESIDENT PEARSE: Mr. Wolfe.

MR. WOLFE: Mr. Chairman, what is the purpose of this? Here we have amendments proposed by the members. What members? Are these amendments different in this column than in this (indicating)? We ought to be given time to think about it and then meet again—given time for consideration. There is no question about it; it was stated by Mr. Owen that this whole thing is to give the Executive Committee more power.

Cries of "Out of order, out of order."

MR. OWEN: Mr. Chairman.

PRESIDENT PEARSE: The gentleman has the floor, Mr. Owen.

MR. OWEN: The gentleman is out of order in his discussion of Section 2, Article II, as the question is whether it shall be referred to a committee or not.

PRESIDENT PEARSE: The point is well taken.

MR. WOLFE: As a point of special privilege, Mr. Chairman?

PRESIDENT PEARSE: As a question of special privilege, Mr. Wolfe.

MR. WOLFE: I believe I have a right to discuss the question before us and I am willing to stay here as long as anyone, as I feel that we are here for a purpose and I want to see things done right.

Cries of "Out of order, out of order."

PRESIDENT PEARSE: Will the gentleman please confine himself to the points at issue? The question is whether the matter shall be referred to a committee.

MR. SCHULER: I wish to take up the question of the motion before the house and wish to say that I believe we should refer this whole subject, together with the committee's reports that are before us, to a special committee of five to report at the next meeting. That is the question before us; that is the whole question. I was surprised a moment ago to note that members were not talking to the question—were not discussing that

particular question. Now some ladies and gentlemen seem to think that we ought to get right at it and I say let us look at it—

MISS HALEY: I rise to a point of order.

PRESIDENT PEARSE: What is your point?

MISS HALEY: My point of order is that the question before the house is whether this Article II, Section 2, shall be referred to a committee to report at the next meeting.

A MEMBER: The question is whether the whole subject shall be referred to a committee.

Cries of "Question! Question!"

MR. SCHULER: I wish to say upon this question, following the eloquent lady who spoke a minute ago, that I believe that the whole subject as stated on the blue and the white paper should be referred to a committee for future action.

PRESIDENT PEARSE: We will now vote upon that question.

MR. SCHULER: I simply want to say a word on this, under the question of special privilege—I want to draw your attention to the importance of this question.

A MEMBER: I ask for a point of order. My point is that the gentleman is not speaking upon this question and I move that the discussion on this question be now closed.

A MEMBER: Second the motion.

PRESIDENT PEARSE: Moved and seconded that this question be referred to a committee and the discussion closed.

MR. SCHULER: I will state that I had the floor at the time the point of order was raised.

A MEMBER: I had the right to make the motion. This gentleman is out of order.

MR. SCHULER: I rise to a question of privilege.

A MEMBER: This gentleman is out of order and is not entitled to the floor. How many times will a gentleman be out of order before he has to sit down? A question of information?

PRESIDENT PEARSE: The Chair will say in reply that if a gentleman is called to order and thereupon brings himself to order, he becomes "in order" and the Chair rules that he has not forfeited his right to the floor.

MR. SCHULER: Mr. Chairman, ladies and gentlemen, I simply would like to say here that I think we ought to act on this motion here, as we are not progressing, and I want to say that we are most heartily in sympathy with it. I am heartily with this report, the committee's report on the By-Laws in question, except in one particular; I don't believe that it is germane—

Cries of "Question! Question!"

MR. SCHULER: I move that we refer this matter to a committee of five.

Motion seconded.

PRESIDENT PEARSE: All in favor of the motion signify by saying Aye, contrary minded, No. The "noes" have it. Now let us have a rising vote. It is moved and seconded that Article II, Section 2, be referred to a committee for report at the next meeting. Motion carried.

MR. SPRINGER: I move the adoption of Article III of the Committee's report as follows:

ARTICLE III—DUTIES OF OFFICERS

SECTION 1. The President shall preside at all meetings of the Association, and shall perform the duties usually devolving upon a presiding officer. In his absence, the ranking Vice-President who is present shall preside; and in the absence of all Vice-Presidents a chairman *pro tempore* shall be elected. The President shall prepare the program for the general sessions of the annual meeting of the Association, and with the advice of the Executive Committee shall determine the time and place of the general meeting of the Association and of the various departments not definitely fixed by these By-Laws

and shall have the power to require such changes to be made in the programs of the Council and the departments as will promote the interest of the annual meeting. The President shall be member *ex officio* of the Board of Trustees and chairman of the Board of Directors and of the Executive Committee. He shall sign all bills approved by the Board of Directors for payment. On the expiration of his term of office as President, he shall be elected First Vice-President for the ensuing year.

SEC. 2. The Secretary shall keep a full and accurate record of the proceedings of the general meetings of the Association and all meetings of the Board of Directors, shall conduct the business of the Association under the direction of the Board of Directors and the President, shall collect all moneys due the Association and pay the same to the Treasurer, shall countersign all bills approved by the Board of Directors for payment, shall advance the interests of the Association in every way in his power, and shall have his records present at all regular meetings of the active members of the Association, and of the Board of Directors. He shall keep a list of members as required by Section 7 of Article I of these By-Laws and shall revise said list annually. He shall be chairman of the Committee on Publication and secretary of the Board of Directors. He shall be the custodian of all the property of the Association not in charge of the Treasurer and the Board of Trustees. He shall give such bond for the faithful performance of his duties as may be required by the Board of Trustees. At the expiration of his term of office, he shall transfer to his successor all moneys, books, and other property in his possession belonging to the Association.

SEC. 3. The Treasurer shall receive from the Secretary, and under the direction of the Board of Trustees shall hold in safekeeping, all moneys paid to the Association; shall pay the same only upon the order of said board; shall notify the chairman of the Board of Trustees whenever the surplus funds in his possession exceed five hundred dollars; shall keep an exact account of his receipts and expenditures, with vouchers for the latter; and said accounts, ending on the first day of July of each year, he shall render to the Board of Trustees, and, when approved by said board, he shall report the same to the Board of Directors at the first regular meeting of the board held during the week of the annual meeting and to the active members at their annual business meeting. The Treasurer shall give such bond for the faithful performance of his duties as may be required by the Board of Trustees. At the expiration of his term of office, he shall transfer to his successor all moneys, books, and other property in his possession, belonging to the Association.

SEC. 4. The Board of Directors shall elect corresponding members as prescribed by Section 6 of Article I of these By-Laws, shall elect members of the National Council of Education as provided in Section 3 of Article IV of these By-Laws, shall have power to fill all vacancies in the body of officers of the Association except the Secretary, shall make all necessary arrangements for the meetings of the Association, the Council, and the departments, shall approve all bills for the payment of moneys by the Association, shall make appropriations for the investigation of educational questions when deemed advisable by the Board of Directors and approved by the Board of Trustees, shall make a full report of the financial condition of the Association (including the reports of the Treasurer and the Board of Trustees) to the active members at their annual business meeting, and shall do all in its power to make the Association a useful and honorable institution.

SEC. 5. The Executive Committee shall assist the presiding officer in arranging for the time and place of the annual meeting of the Association, of the National Council of Education, and of the various departments.

SEC. 6. The Board of Trustees shall require of the Secretary and the Treasurer each a bond of such amount as may be determined by said board, for the faithful performance of his duties, shall make a full report of the finances of the Association to the Board of Directors at the first regular meeting of the board held during the week of the annual meeting of the Association, and shall annually determine the date at which the term of office of the Treasurer shall expire, which date shall not be latter than the first of August. It shall choose its own chairman and secretary.

Seconded.

PRESIDENT PEARSE: Moved and seconded that the committee's report on Article III be adopted.

MR. OWEN: I move to substitute for Article III, as follows (reading):

ARTICLE III—DUTIES OF OFFICERS

SECTION 1. The President shall preside at all meetings of the Association and shall perform the duties usually devolving upon the chief executive officer of such an Association. In his absence the ranking Vice-President who is present shall preside; and in

the absence of all Vice-Presidents, a chairman *pro tempore* shall be elected. The President shall prepare the program for the general sessions of the annual meeting of the Association, and, with the approval of the Executive Committee, shall determine the time and place of the general meeting of the Association and of the various departments not definitely fixed by these By-Laws, and shall have the power to require such changes to be made in the programs of the Council and the departments as will promote the interest of the annual meeting. The President shall be a member *ex officio* of the Board of Trustees and chairman of the Board of Directors and of the Executive Committee. He shall sign all bills approved for payment by the Board of Directors, and all bills approved or authorized by the Executive Committee between the meetings of the Board of Directors. On the expiration of his term of office as President, he shall become First Vice-President, for the ensuing year, and shall be chairman *ex officio* of the Committee on Publication.

A MEMBER: I second the motion.

PRESIDENT PEARSE: Regularly moved and seconded that the substitute as read for Section 1, Article III, be adopted. All in favor of the motion signify by saying Aye, all contrary, No.

Motion carried.

MR. OWEN: I move the adoption of Section 2 of Article III as printed, with the exception of the words "June 20," in that section having it changed to "July 1," making that sentence read as follows: "He shall submit his annual report to the Executive Committee not later than July 1 prior to the annual meeting of the Association, which report shall be transmitted to the Board of Directors at its annual meeting."

ARTICLE III

SEC. 2. The Secretary shall keep a full and accurate record of the proceedings of the general meetings of the Association and all meetings of the Board of Directors and of the Executive Committee, shall conduct the business of the Association as provided in the Articles of Incorporation and the By-Laws, and in all matters not definitely prescribed therein, shall be under the direction of the Executive Committee, and in the absence of direction by the Executive Committee shall be under the direction of the President, and shall receive or collect all moneys due the Association and pay the same each month to the Treasurer, shall countersign all bills approved for payment by the Board of Directors or by the Executive Committee in the interval between the meetings of the Board of Directors or on the approval of the President acting under authority of the Board of Directors, or Executive Committee. The Secretary shall have his records present at all meetings of the active members of the Association, of the Board of Directors, and of the Executive Committee. He shall keep a list of members as required by Section 9 of Article I of these By-Laws and shall revise said list annually. He shall be secretary of the Board of Directors, and a member of the Committee on Publication. He shall be the custodian of all the property of the Association not in charge of the Treasurer and the Board of Trustees. He shall give such bond for the faithful performance of his duties as may be required by the Executive Committee. He shall submit his annual report to the Executive Committee not later than July 1 prior to the annual meeting of the Association, which report shall be transmitted to the Board of Directors at its annual meeting. At the expiration of his term of office he shall transfer to his successor all moneys, books, and other property in his possession belonging to the Association. The Secretary shall not print, publish, or distribute any official report or other document without the approval of the publication committee.

PRESIDENT PEARSE: Regularly moved and seconded that the section as read be adopted.

Motion carried.

MR. OWEN: I move that Section 3 of Article III be adopted with the exception that the words "Executive Committee" in line 2 be changed to "Board of Trustees."

ARTICLE III

SEC. 3. The Treasurer shall receive from the Secretary and under the direction of the Executive Committee shall hold in safekeeping all moneys paid to the Association; shall pay the same only upon the order of the Board of Trustees; shall notify the President of the Association and the chairman of the Board of Trustees whenever the surplus funds in his possession exceed five hundred dollars; shall keep an exact account of his receipts and

expenditures, with vouchers for the latter; and said accounts, ending on the fifteenth day of June of each year, he shall render to the Executive Committee not later than June 20, and, when approved by said committee, they shall be transmitted by the committee to the Board of Directors at the first regular meeting of the board held during the week of the annual meeting and to the active members at their annual business meeting. The Treasurer shall give such bond for the faithful performance of his duties as may be required by the Board of Trustees. At the expiration of his term of office, he shall transfer to his successor all moneys, books, and other property in his possession belonging to the Association.

PRESIDENT PEARSE: Is there any objection to this change? If there is not the change will be made; unanimously agreed to. Moved and seconded that the section as amended be adopted. All in favor of the motion signify by saying Aye, contrary, No. Motion carried.

MR. SPRINGER: In Section 2 of Article III where it has reference to the Secretary giving a bond, it prescribes that he shall give his bond to the Executive Committee. All other bonds go to the Board of Trustees. By the Articles of Incorporation, the Board of Trustees is the regularly recognized custodian of such papers and I think that change should be made the same as in any other case.

PRESIDENT PEARSE: I don't understand the latter part of it.

MR. SPRINGER: The papers relating to property and things of that sort. By the Articles of Incorporation the Trustees are recognized as the custodians of such papers. This relates to the property bond and implies that the Secretary should give his bond to the Board of Trustees the same as the Treasurer does.

MR. OWEN: I accept the amendment.

PRESIDENT PEARSE: The change will then be that where bonds are required the bonds should be acceptable to the Board of Trustees instead of the Executive Committee. If there is no objection the change will be made; it is so ordered.

MR. OWEN: There is a change also made in Section 3 of Article III in reference to accounts and expenditures, in the third line from the top of the page, from "the fifteenth day of June" to "the thirtieth day of June"; also in the next line, from "June 20" change to "July 1"; I will read the section as changed (reading):

SEC. 3. The Treasurer shall receive from the Secretary and under the direction of the Board of Trustees shall hold in safekeeping all moneys paid to the Association; shall pay the same only upon the order of the Board of Trustees; shall notify the President of the Association and the chairman of the Board of Trustees, whenever the surplus funds in his possession exceed five hundred dollars; shall keep an exact account of his receipts and expenditures with vouchers for the latter; and said accounts, ending on the thirtieth day of June of each year, he shall render to the Executive Committee not later than July 1, and when approved by the said committee, they shall be transmitted by the committee to the Board of Directors at the first regular meeting of the board held during the week of the annual meeting and to the active members at their annual business meeting. The Treasurer shall give such bond for the faithful performance of his duties as may be required by the Board of Trustees. At the expiration of his term of office, he shall transfer to his successor all moneys, books, and other property in his possession, belonging to the Association.

PRESIDENT PEARSE: You have heard the section read and the motion that it be adopted as read with the changes made.

Motion carried.

MR. OWEN: I will read the substitute for Section 4 and move its adoption.

ARTICLE III

SEC. 4. The Board of Directors shall elect corresponding members as prescribed by Section 8 of Article I of these By-Laws, shall elect members of the National Council of Education as provided in Section 3 of Article IV of these By-Laws, shall have power to fill all vacancies in its own body and in the Board of Trustees; shall recommend to the Executive Committee the place for holding the annual meeting of the Association, the Council of Education, and the departments. The Board of Directors shall approve all bills incurred under authority of the Board of Directors, the Executive Committee, or

the President and Secretary acting under the authority of the Board of Directors or Executive Committee, shall appropriate from the current funds of the year the amounts of money ordered by the active members at their annual business meeting for the work of all special committees of investigation and research authorized and provided for by such active members at their annual business meeting, shall make a full report of the financial condition of the Association (including the reports of the Secretary, the Treasurer, and the Board of Trustees) to the active members at their annual business meeting, and shall do all in its power to make the Association a useful and honorable institution.

A MEMBER: Second the motion to adopt the section as read.

PRESIDENT PEARSE: Moved and seconded that the section be adopted as read.

Motion carried.

A MEMBER: I move the substitute for the remainder of Article III be adopted.

MR. OWEN: I second the motion and will read Sections 5 and 6 (reading):

SEC. 5. The Executive Committee shall assist the presiding officer in arranging for the time and place of the annual meeting of the Association, of the National Council of Education, and of the various departments.

The Executive Committee shall recommend to the active members at their annual business meeting the appointment of special committees for investigation or research, the subjects for which may have been suggested by the National Council, or by the active membership of the National Education Association, or by any of its departments; it shall recommend the amount of money to be appropriated for such investigations. When such special committees are provided for and duly authorized by the active members at their annual business meeting, the Executive Committee shall have general supervision of them; shall receive and consider all reports made by them and shall print such reports, and present the same, together with the reports received from the Secretary, the Treasurer, and the Board of Trustees and the recommendations of the Executive Committee thereon, to the active members at their annual business meeting. All such special committees shall be appointed by the President of the National Education Association.

The Executive Committee shall fill all vacancies occurring in the body of officers of the Association except vacancies in the Board of Directors, Board of Trustees, and the office of Secretary.

SEC. 6. The Board of Trustees shall require of the Secretary and Treasurer bonds of such amount as may be determined by said board for the faithful performance of their duties; shall make a full report of the finances of the Association to the Executive Committee not later than July 1 prior to the annual meeting of the Association, which report shall be transmitted by the Executive Committee to the Board of Directors at the first regular meeting of the board held during the week of the annual meeting of the Association. It shall choose annually its own chairman and secretary.

PRESIDENT PEARSE: It is regularly moved and seconded that the sections as read be adopted.

Motion carried.

MR. SPRINGER: I move the adoption of the next article, Article IV, of the report of the Committee on Revision of the By-Laws, as follows:

ARTICLE IV—THE NATIONAL COUNCIL OF EDUCATION

SECTION 1. The National Council of Education shall discuss educational questions of public and professional interest; propose to the Board of Directors, from time to time, suitable subjects for investigations and research, and recommend the appointment of special committees of investigation and research, and the amount of appropriation that should be made for such purpose. When such special committees are provided for and authorized by the Board of Directors of the Association, the Council shall appoint them from the active membership of the Association, and have general supervision of them; receive and consider all reports made by them and report to the Board of Directors the result of its deliberations, with recommendations as to the disposition of said reports; have a report made at its annual meeting on "Educational Progress during the Past Year"; and in other ways use its best efforts to further the objects of the Association and to promote the cause of education in general.

SEC. 2. The National Council of Education shall consist of 120 regular members, selected from the active membership of the National Education Association. Any active member of the Association having the right to vote in the Association is eligible to membership in the Council, and, after the year 1909, each member shall be elected for six years and until his successor is elected.

SEC. 3. The annual election of members of the Council shall be held at the time of the annual meeting of the Association. The Board of Directors shall annually elect ten members and the Council ten members, and each body shall fill all vacancies in its quota of members. No state, territory, or district in the United States shall have at one time more than eight regular members in the Council.

SEC. 4. The annual meeting of the Council shall be held during the week of the annual meeting of the Association.

SEC. 5. The absence of a regular member from two successive annual meetings of the Council shall be considered equivalent to his resignation of membership. Persons whose regular membership in the Council has expired shall be denominated honorary members of the Council during the time of their active membership in the Association, with the privilege of attending the regular sessions of the Council and participating in its discussions. A member who discontinues or forfeits his active membership in the Association forfeits his membership in the Council.

SEC. 6. The officers of the Council shall consist of a president, a vice-president, a secretary, and such standing committees as may be prescribed by its by-laws, all of whom shall be regular members of the Council. The secretary of the Council shall, in addition to performing the duties pertaining to his office, furnish the Secretary of the Association a copy of the proceedings of the Council for publication. No president of the Council shall succeed himself in office.

SEC. 7. The National Council of Education is hereby authorized to adopt by-laws for its government not inconsistent with the Act of Incorporation or the By-Laws of the Association; *provided*, That such by-laws be submitted to and approved by the Board of Directors of the Association before they shall become operative.

SEC. 8. The Council may be changed or abolished upon a three-fourths vote of the Board of Directors of the Association taken at a regular meeting of the board upon the recommendation of a majority of the regular members of the Council; *provided*, That due announcement has been made of the proposed action.

MR. OWEN: I move that Article IV, as suggested by members, be substituted for Article IV as reported by the Committee of the National Education Association.

Motion seconded.

PRESIDENT PEARSE: You have heard the motion.

MR. OWEN: I will read Article IV.

ARTICLE IV—THE NATIONAL COUNCIL OF EDUCATION

SECTION 1. The National Council of Education shall discuss educational questions of public and professional interest; propose to the Executive Committee, from time to time, suitable subjects for investigation and research; have a report made at its annual meeting on "Educational Progress during the Past Year"; and in other ways use its best efforts to further the objects of the Association and to promote the cause of education in general.

SEC. 2. The National Council of Education shall consist of 120 regular members, selected from the active membership of the National Education Association. Any active member of the Association is eligible to membership in the Council, and each member shall be elected for six years and until his successor is elected.

SEC. 3. The annual election of members of the Council shall be held at the time of the annual meeting of the Association. The Board of Directors of the Association shall annually elect ten members and the Council ten members, and each body shall fill all vacancies in its quota of members. No state, territory, or district in the United States shall have at one time more than seven regular members in the Council.

SEC. 4. All meetings of the Council shall be held in connection with the annual meeting of the Association.

SEC. 5. The absence of a regular member from two successive annual meetings of the Council shall be considered equivalent to his resignation of membership. Persons whose regular membership in the Council has expired shall be denominated honorary members of the Council during the time of their active membership in the Association, with the privilege of attending the regular sessions of the Council and participating in its discussions. A member who discontinues or forfeits his active membership in the Association forfeits his membership in the Council.

SEC. 6. The officers of the Council shall consist of a president, a vice-president, a secretary, and such standing committees as may be prescribed by its by-laws, all of whom shall be regular members of the Council. The secretary of the Council shall, in addition to performing the duties pertaining to his office, furnish the Secretary of the Association a copy of the proceedings of the Council for publication.

SEC. 7. The National Council of Education is hereby authorized to adopt by-laws for its government not inconsistent with the Act of Incorporation or the By-Laws of the Association; *provided*, That such by-laws be submitted to and approved by the Board of Directors of the Association before they shall become operative.

SEC. 8. The powers and duties of the Council may be changed or the Council abolished upon a two-thirds vote of the Association taken at the annual business meeting of the Association; *provided*, That notice of the proposed action has been given at the preceding annual business meeting of the Association.

MR. ALEY: It seems to me that Section 4 of Article IV, which requires that all meetings of the Council shall be held in connection with the annual meeting of the Association, is entirely new matter and should be referred to a committee for action in one year. I make a motion to that effect.

A MEMBER: I second the motion.

PRESIDENT PEARSE: The Chair has heard the motion and the second that Section 4, relative to the holding of all meetings of the Council at the time of the annual meeting of the Association, be referred to a committee to report in one year. All those in favor of the motion say Aye, contrary, No. Motion carried.

A MEMBER: I move the adoption of Article IV, as read, with the exception of Section 4.

A MEMBER: I second the motion.

PRESIDENT PEARSE: It has been regularly moved and seconded that the substitute for Article IV be adopted as read, with the exception of Section 4, which has been referred to a committee. All those in favor of the adoption of the substitute will say Aye, contrary, No. Motion carried.

MR. SPRINGER: I move that Article V be adopted as presented by the committee as follows:

ARTICLE V—DEPARTMENTS

SECTION 1. The following departments are now (1910) in existence, to wit: The departments, first, of Superintendence; second of Normal Schools; third, of Elementary Education; fourth, of Higher Education; fifth, of Manual Training, Art, and Technical Education; sixth, of Kindergarten Education; seventh, of Music Education; eighth, of Secondary Education; ninth, of Business Education; tenth, of Child Study; eleventh, of Physical Education; twelfth, of Natural Science Instruction; thirteenth, of School Administration; fourteenth, the Library Department; fifteenth, of Special Education; sixteenth, of School Patrons; seventeenth, of Rural and Agricultural Education.

SEC. 2. The active members of the Association having the right to vote in the Association, and no others, are members of each department of the Association.

SEC. 3. Each department shall hold its annual meeting at the time and place of the annual meeting of the Association, except the Department of Superintendence and the Department of Normal Schools, which may hold their annual meeting in February of each year or at such other time as may be determined by said departments, subject to the approval of the Board of Directors of the Association.

SEC. 4. The object of the annual meetings of the departments shall be the discussion of questions pertaining to their respective fields of educational work. The programs of these meetings shall be prepared by the respective presidents in conference with, and under the general direction of, the President of the Association. Each department shall be limited to two sessions, with formal programs, at the time of the annual convention, unless otherwise ordered by the President of the Association, except that a third session for business or informal round-table conference may be held at the discretion of the department officers.

SEC. 5. The officers of each department shall consist of a president, a vice-president, and a secretary, who shall be elected at the last formal session of the department to serve one year and until their successors are duly elected, and who shall, at the time of their election, be active members of the Association, having the right to vote in the Association. No president of a department shall succeed himself in office.

SEC. 6. The secretary of each department shall, in addition to performing the duties usually pertaining to his office, furnish the Secretary of the Association a copy of the proceedings of the meeting of the department for publication.

SEC. 7. All departments shall have equal rights and privileges, with the exception stated in Section 3 of this article. They shall be named in Section 1 of this article in the

order of their establishment and shall be dropped from the list when discontinued. Each department may be governed by its own regulations in so far as they are not inconsistent with the Act of Incorporation, or these By-Laws.

SEC. 8. A new department may be established by a two-thirds vote of the Board of Directors of the Association taken at a regular meeting of the board; *provided*, That a written application for said department, with title and purpose of the same, shall have been made at the regular meeting of the board next preceding the one at which action is taken, by at least twenty-five active members engaged in the field of labor in the interest of which the department is purposed to be established. A department already established may be discontinued by the Board of Directors upon a two-thirds vote taken at a regular meeting; *provided*, That announcement has been made of the proposed action at a regular meeting of the board the preceding year. A department shall be discontinued when it fails to hold a regular meeting for two successive years.

A MEMBER: I don't see any difference between the two articles, that is Section 1 of the two articles.

The Chair asked Mr. Owen from this time on merely to explain the differences.

ARTICLE V—DEPARTMENTS

SECTION 1. The following departments are now (1912) in existence, to wit: The departments, first, of Superintendence; second, of Normal Schools; third, of Elementary Education; fourth, of Higher Education; fifth, of Manual Training, Art, and Technical Education; sixth, of Kindergarten Education; seventh, of Music Education; eighth, of Secondary Education; ninth, of Business Education; tenth, of Child Study; eleventh, of Physical Education; twelfth, of Natural Science Instruction; thirteenth, of School Administration; fourteenth, the Library Department; fifteenth, of Special Education; sixteenth, of School Patrons; seventeenth, of Rural and Agricultural Education.

SEC. 2. The active members of the Association, and no others, are members of each department of the Association.

SEC. 3. All meetings of all departments shall be held at the time and place of the annual meeting of the Association, except the Department of Superintendence, which may hold its annual meeting in February of each year or at such other time as may be determined by said department, subject to the approval of the Executive Committee of the Association.

SEC. 4. The object of the meetings of the departments shall be the discussion of questions pertaining to their respective fields of educational work. The programs of these meetings shall be prepared by the respective presidents in conference with and under the general direction of the President of the Association. Each department shall be limited to two sessions with formal programs, unless otherwise ordered by the President of the Association, except that a third session for business or informal round-table conference may be held at the discretion of the department officers.

SEC. 5. The officers of each department shall consist of a president, a vice-president, and a secretary, who shall be elected at the last formal session of the department to serve one year and until their successors are duly elected, and who shall at the time of their election be active members of the Association.

SEC. 6. The secretary of each department shall, in addition to performing the duties usually pertaining to his office, furnish the Secretary of the Association a copy of the proceedings of the meetings of the department for publication.

SEC. 7. All departments shall have equal rights and privileges, with the exception stated in Section 3 of this article. They shall be named in Section 1 of this article in the order of their establishment and shall be dropped from the list when discontinued. Each department may be governed by its own regulations in so far as they are not inconsistent with the Act of Incorporation, or these By-Laws.

A new department may be established by a two-thirds vote of the Board of Directors taken at a regular meeting of the board or by a two-thirds vote of the active members at any annual business meeting; *provided*, That a written application for said department, with title and purpose of the same, shall have been made at the regular meeting of the board next preceding the one at which action is taken, or at the preceding annual business meeting, by at least twenty-five members engaged or interested in the field of labor in the interest of which the department is purposed to be established. A department already established may be discontinued by the Board of Directors upon a two-thirds vote taken at a regular meeting, or by a two-thirds vote of the active members at any annual business meeting; *provided*, That announcement has been made of the proposed action at a regular meeting of the board the preceding year, or at the preceding annual business meeting. A

department shall be discontinued when it fails to hold a regular meeting for two successive years.

MR. OWEN (reading): Section 2, as proposed by the members:

The active members of the Association, and no others, are members of each department of the Association.

And the National Education Association report is:

The active members of the Association having the right to vote in the Association, and no others, are members of each department of the Association.

And in Section 3 the members propose in the last sentence "subject to the approval of the Executive Committee of the Association." And the National Education Association committee's recommendation on the same subject and the last line of the section is "subject to the approval of the Board of Directors of the Association." I move the adoption of those changes as an amendment to the motion already made.

A MEMBER: I second the motion.

MR. SPRINGER: Permit me to call your attention to another thing, that is, next to the last sentence in Section 8: "By a two-thirds vote of the active members at any annual business meeting." I suggest the change there, that it be, "By a two-thirds vote of the active members at any business meeting of the active members." I suggest that as a substitute.

PRESIDENT PEARSE: Is there any objection to the change? Hearing none, it is made.

MR. KIRK: Section 3 of this Article V reads that, "All meetings of all departments shall be held at the time and place of the annual meeting of the Association, except the Department of Superintendence."

PRESIDENT PEARSE: The Educational Council has been included with the Department of Superintendence.

MR. KIRK: I understand, Mr. Chairman, that all of Section 3 has been referred to a committee for one year?

PRESIDENT PEARSE: The Chair does not so understand. The Chair understands that there has been a suggestion made as to the provision, "All meetings of all departments shall be held at the time and place of the annual meeting of the Association, except the Department of Superintendence" and Educational Council. I will entertain a motion—

MR. KIRK: I am sure the members of this Association do not wish to wholly destroy the utility of any department. It turns out that there is a new force which we have to deal with. We want to be loyal to the National Education Association and come to every meeting that it has, but between the Rocky Mountains and the Alleghanies, the summer terms of the universities and the normal schools constitute an enormous force—a large influence that has to be recognized and dealt with. The summer term has nearly doubled in attendance during the past few years. The faculties in many universities and in most of the normal schools cannot possibly get away to attend the summer meetings of the National Education Association.

A MEMBER: Will Mr. Kirk yield the floor a minute?

PRESIDENT PEARSE: Mr. Kirk yields.

MR. SCRIBNER: I move that the whole of Section 3, Article V be referred to the committee to be reported on in a year.

MR. KIRK: I second the motion.

PRESIDENT PEARSE: The motion is made and seconded that Section 3 of Article V be referred to a committee for one year. All in favor of the motion say Aye, contrary, No. Motion carried.

A MEMBER: I move that the substitute for Article V as changed, with exception of Section 3, be adopted.

Motion seconded and duly carried.

MR. SPRINGER: I move the adoption of Article VI as reported by the National Education Association committee, as follows:

ARTICLE VI—COMMITTEES

SECTION 1. On the first day of each annual meeting of the Association the President shall appoint a Committee on Resolutions, consisting of seven active members, and a Committee on Necrology, consisting of five active members; and on the second day of such meeting he shall appoint a Committee on Nominations, consisting of one active member from each state, territory, and district, represented at the meeting. Each state, territorial, and district representative shall be appointed on the nomination of the active members in attendance from said state, territory, or district; *provided*, That five or more active members having the right to vote in the Association participate in said nomination in accordance with these By-Laws; and *provided further*, That in case of the failure of the active members of any state, territory, or district to nominate a member of the nominating committee in accordance with these By-Laws, the President shall appoint an active member from said state, territory, or district, to serve on said committee. At the regular meeting of the Board of Directors on the first day of the annual meeting, the President shall appoint an Auditing Committee consisting of three directors. The chairman of each of the foregoing committees shall be designated by the President of the Association at the time of its appointment.

SEC. 2. The meetings of active members to nominate members of the nominating committee shall be held on the first day of the annual meeting of the Association, at such time and places as shall be designated in the annual program by the President of the Association.

SEC. 3. The Committee on Nominations shall meet on the third day of the annual meeting at 9:30 A.M., at a place designated by the President of the Association, and shall nominate persons for the following offices in the Association, to wit: one person for President, twelve persons for Vice-Presidents, one person for Treasurer, and one person from each state, territory, and district in the United States as a member of the Board of Directors. It shall report to the active members at their annual business meeting.

SEC. 4. The Committee on Resolutions shall report at the last session of the annual meeting and all resolutions relating to the policy of the Association shall be referred to said committee, without discussion.

SEC. 5. The Auditing Committee shall audit the Secretary's and the Treasurer's accounts and make a thoro examination of the finances of the Association. It shall report to the new Board of Directors at the first regular meeting of the board.

SEC. 6. The Committee on Necrology shall prepare for the volume of *Proceedings* a list of the active and corresponding members that have died during the year, accompanied by memorial sketches whenever practicable.

SEC. 7. Within thirty days prior to the time of the annual meeting of the Association, the President, with the advice and consent of the Secretary and the Treasurer, shall appoint a competent person or persons, who shall examine the securities of the Permanent Fund held by the Board of Trustees, and certify in writing to their condition to the Board of Directors at the first regular meeting of the board held during the week of the annual meeting.

MR. OWEN: I move the adoption of the substitute.

ARTICLE VI—COMMITTEES

SECTION 1. On the first day of each annual meeting of the Association the President shall appoint a Committee on Resolutions, consisting of seven active members, and a Committee on Necrology, consisting of five active members, and on the third day of such meeting he shall appoint a Committee on Nominations, consisting of one active member from each state, territory, and district represented at the meeting. Each state, territorial, and district representative shall be appointed on the nomination of the active members in attendance from said state, territory, or district; *provided*, That three or more active members participate in said nomination in accordance with these By-Laws; and *provided further*, That in case of the failure of the active members of any state, territory, or district to nominate a member of the nominating committee, in accordance with these By-Laws, the President shall appoint an active member from said state, territory, or district, to serve on said committee. At the regular meeting of the Board of Directors on the first day of the annual meeting, the President shall appoint an Auditing Committee consisting of three active members of the Association, no one of whom shall be either a

trustee or a director; to this committee shall be referred the report of the expert accountant, together with the communication of the President transmitting the same, as provided in Section 6 of this article; and the committee shall report its findings at the meeting of active members. Further it is provided that at the annual business meeting of the Association in 1912, the President shall appoint a Committee on Teachers' Welfare, consisting of seven members, all of whom shall be active members of the Association. The terms of the members so appointed shall expire as follows: One-seventh in one year, one-seventh in two years, one-seventh in three years, one-seventh in four years, one-seventh in five years, one-seventh in six years, one-seventh in seven years. At the annual business meeting of the year 1913 and each year thereafter, the President shall appoint one member of such committee to fill vacancy created as above. The chairman of each of the foregoing committees shall be designated by the President of the Association at the time of its appointment.

SEC. 2. The meetings of active members present from the several states, territories, etc., to nominate members of the nominating committee, shall be held on the first day of the annual meeting of the Association, at such time and places as shall be designated on the annual program by the President of the Association.

SEC. 3. The Committee on Nominations shall meet on the fourth day of the annual meeting at 9:00 A.M., at a place designated by the President of the Association, and shall nominate persons for the following offices in the Association, to wit: one person for President, eleven persons for Vice-Presidents, one person for Treasurer, and one person from each state, territory, and district in the United States as a member of the Board of Directors. It shall report to the active members at their annual business meeting.

SEC. 4. The Committee on Resolutions shall report at the annual business meeting of active members, and, except by unanimous consent, all resolutions shall be referred to said committee, without discussion. This committee shall receive and consider all resolutions proposed by active members, or referred to it by the President; some time during the second day of the annual meeting of the Association the committee shall hold a meeting, at a place and time to be announced in the printed program, for the purpose of receiving proposed resolutions and hearing those who may wish to advocate them.

SEC. 5. The Committee on Necrology shall prepare for the published *Proceedings* a list of the active and corresponding members that have died during the year, accompanied by memorial sketches whenever practicable.

SEC. 6. The Committee on Teachers' Welfare shall collect data bearing on the promotion of the teachers' physical, financial, and educational advancement. It shall keep such information corrected from time to time as may be required, in proper form to use in the promotion of the teachers' welfare.

SEC. 7. Within thirty days prior to the time of the annual meeting of the Association, the President shall appoint a competent person, firm, or corporation licensed to do business as expert accountants; the accountants so appointed shall examine the accounts, papers, and vouchers of the Secretary, the Treasurer, and the Board of Trustees, and compare the same, and shall also examine the securities of the Permanent Fund held by the Board of Trustees. The report of the said accountants shall be filed with the President before the opening day of the annual meeting of the Association, and shall be by him submitted with such comments as he may think proper, to the Board of Directors, at their meeting held on the first day of the annual meeting of the Association.

MR. OWEN: I move the adoption of the substitute. I will refer to parts of it. Now in Section 1 as printed, on the fourth line, "On the third day of such meeting he shall appoint a nominating committee." That change was made to give the President more time to select the committee. I simply call your attention to Article VI of the National Education Association committee, wherein it differs from Article VI on the right-hand column. I will begin to read at the italicized matter.

At a regular meeting of the Board of Directors on the first day of the annual meeting, the President shall appoint an Auditing Committee, consisting of three active members of the Association, no one of whom shall be either a trustee or a director; to this committee shall be referred the report of the expert accountant, together with the communication of the President, transmitting the same as provided in Section 6 of this article; and the committee shall report its findings at the meeting of active members. Further it is provided that at the annual business meeting of the Association in 1912 the President shall appoint a Committee on Teachers' Welfare, consisting of seven members, all of whom shall be active members of the Association. The terms of the members so appointed shall expire as follows: One-seventh in one year, one-seventh in two years, one-seventh in three years, one-seventh in four years, one-seventh in five years, one-seventh in

six years, one-seventh in seven years. At the annual business meeting in 1913 and each year thereafter, the President shall appoint one member of such committee to fill the vacancy created as above. The chairman of each of the foregoing committees shall be designated by the President of the Association at the time of its appointment.

I shall not go into that any further, but on Section 3 there is a change as to time in which the nominating committee shall meet. It was said 9:00 A.M., instead of 9:30 as shown in Section 3 in this report. There was a correction in the same paragraph, eleven persons for Vice-Presidents, because one of them we have already provided for and that is the retiring president shall become the First Vice-President, instead of "One person for President, twelve persons for Vice-Presidents."

In reference to Section 4: here is a provision that is new:

And except by unanimous consent all resolutions shall be referred to said committee, without discussion. This committee shall receive and consider all resolutions proposed by active members, or referred to it by the President; some time during the second day of the annual meeting of the Association the committee shall hold a meeting at a place and time to be announced in the printed program, for the purpose of receiving proposed resolutions and hearing those who may wish to advocate them.

Section 5, no change. Section 6, I need not read. Section 7, I will read.

PRESIDENT PEARSE: Read that.

MR. OWEN (reading):

SEC. 7. Within thirty days prior to the time of the annual meeting of the Association, the President shall appoint a competent person, firm, or corporation licensed to do business as expert accountants; the accountants so appointed shall examine the accounts, papers, and vouchers of the Secretary, the Treasurer, and the Board of Trustees, and compare the same, and shall also examine the securities of the Permanent Fund held by the Board of Trustees. The report of the said accountants shall be filed with the President before the opening day of the annual meeting of the Association, and shall be by him submitted with such comments as he may think proper, to the Board of Directors, at their meeting held on the first day of the annual meeting of the Association.

MR. SCRIBNER: That provision of Sections 1 and 6, Article VI, with reference to the appointment of a Committee on Teachers' Welfare, is new matter; I move that the same be referred to a committee for report in a year. It should lie over for a year in order to legally bring it before us.

Motion duly seconded and carried that portions of said sections be so referred to a committee.

PRESIDENT PEARSE: Moved and seconded that the article as read and amended shall be accepted as a substitute for the other; carried.

SECRETARY SHEPARD: I wish to ask, as a member, for the ruling of the Chair upon one or two points. The By-Laws provide that amendments may pass by a two-thirds vote of the members present. Does that mean the members present at the convention or members present at the meeting?

PRESIDENT PEARSE: The Chair rules that it means the members present and voting.

SECRETARY SHEPARD: It appears at this meeting that there are now about 500 present; does it mean the number present at the moment the question is proposed?

PRESIDENT PEARSE: Yes.

SECRETARY SHEPARD: As to the rule, the By-Laws provide that there shall be two-thirds of the members voting in favor of or against an amendment. Now admitting that this means two-thirds of the members present at this moment; there has been no test as to whether the motions that have been passed have been by a two-thirds vote of the actual members present. Therefore, I think it is a serious question.

PRESIDENT PEARSE: The question has been raised, and the Chair will rule. The Chair has full knowledge of the fact that a two-thirds vote is necessary on all these questions of amendment, and the Chair has ruled in the light of that knowledge, on all these propositions. There has been no question raised as to the fact that two-thirds of the members present and voting, voted in favor of each proposition which has been declared carried. Results, therefore, stand as declared. If at any time the question is raised

as to whether any proposition has the required two-thirds vote, the Chair will ascertain the number by counting.

MR. SPRINGER: I move that the next Article, VII, be adopted as prepared by the National Education Association committee as follows:

ARTICLE VII—MEETINGS

SECTION 1. A stated meeting of the Association, of the Council of Education, and of each department shall be held annually at such time and place as shall be determined by these By-Laws or by the Board of Directors or the Executive Committee acting for the board. An annual meeting of the Association and its subordinate bodies may be omitted for an extraordinary cause, upon the written consent of two-thirds of the directors of the Association, obtained by the Executive Committee.

SEC. 2. The annual meeting of the Association shall be held in July, beginning on a day determined by the Executive Committee. Two sessions shall be held daily, unless otherwise ordered by the President of the Association. The annual business meeting of the active members shall be held on the third day of the annual meeting at 12:30 P.M. A regular meeting of the Board of Directors shall be held on the first day of the annual meeting at 11:30 A.M. The first regular meeting of the new Board of Directors shall be held on the third day of the annual meeting at 4:30 P.M., the President-elect presiding. Special meetings of the Board of Directors may be called by the President upon the written request of twenty-five members of the board. The Board of Trustees shall hold its annual meeting at some convenient time during the annual meeting of the Association. Special meetings of the Board of Trustees may be held at such times and places as the board or the chairman shall determine. Due notice of all meetings of the board shall be given to every member of the board by the secretary of the board.

A MEMBER: Second the motion.

MR. OWEN: I move to substitute for Article VII.

ARTICLE VII—MEETINGS

SECTION 1. A stated meeting of the Association, of the Council of Education, and of each department shall be held annually at such time and place as shall be determined by the Board of Directors or the Executive Committee acting for the board in accordance with these By-Laws. An annual meeting of the Association and its subordinate bodies may be omitted for an extraordinary cause, upon the written consent of two-thirds of the directors of the Association, obtained by the Executive Committee.

SEC. 2. The annual meeting of the Association shall be held in July, beginning on a day determined by the Executive Committee. Two sessions shall be held daily, unless otherwise ordered by the President of the Association. The annual business meeting of the active members shall be held on the fourth day of the annual meeting at 11:00 A.M. A regular meeting of the Board of Directors shall be held on the first day of the annual meeting at 10:30 A.M. The first regular meeting of the new Board of Directors shall be held as soon as practicable and within twenty-four hours after the close of the last session of the annual meeting, the place and time of the meeting to be announced in the printed program. The Board of Trustees shall hold its annual meeting at some convenient time and immediately following the meeting of the new Board of Directors referred to above in this section. Special meetings of the trustees may be called by the chairman, and shall be called on request of the majority of the Board of Trustees. Due notice of all meetings of the Board of Trustees shall be given to every member of the board by the secretary thereof.

MR. OWEN: I will proceed at once to point out the differences: In Section 2, it states the annual business meeting of the active members shall be held on the fourth day at 11:00 A.M., instead of the third day at 12:30; that a regular meeting of the Board of Directors shall be held on the first day of the annual meeting at 10:30 A.M.; that the first regular meeting of the new Board of Directors shall be held as soon as practicable and within twenty-four hours after the last session of the annual meeting; also that the Board of Trustees shall hold their annual meeting at some convenient time and immediately following the meeting of the new Board of Directors referred to above in this section. Special meetings of the Trustees may be called by the chairman and shall be called on request of the majority of the Board of Trustees.

Motion to adopt substitute seconded.

MR. SCRIBNER: Move to amend that portion of the substitute which fixes the hour of the annual meeting, in view of our experiences today to change the hour from 11 o'clock to 10 o'clock A.M.

Motion seconded.

MR. HALL: It is impossible to have the annual business meeting at 10 o'clock in the morning on account of the meeting of the nominating committee.

MR. OWEN: Inasmuch as this change will require considerable checking up with other changes, it would be wise to let the time remain as proposed in the substitute motion, at 11 o'clock.

MR. SCRIBNER: In view of that explanation, I will withdraw my motion.

PRESIDENT PEARSE: Motion made is withdrawn. The question now is on the adoption of the substitutes for Article VII as you have heard it. All in favor of the adoption signify by saying Aye; contrary, No. Motion carried.

MR. SPRINGER: I move that Article VIII of the committee's report be adopted as follows:

ARTICLE VIII—PROCEEDINGS

SECTION 1. The proceedings of the meetings of the Association, the Council, and the department shall be published in a volume under the direction of a committee consisting of the permanent Secretary, the President, and the first Vice-President; *provided*, That in the opinion of the Board of Trustees the funds of the Association warrant the publication. Each member of the Association shall be entitled to a copy of the volume of *Proceedings*. Associate members must make written application to the Secretary on or before September 1 for a copy in order to obtain it. Corresponding members, and active members whose dues are paid, will receive the volume without written application.

SEC. 2. No paper, lecture, or address shall be read before the Association or any of the departments in the absence of its author, without the approval of the President of the Association or of the departments, nor shall any such paper, lecture, or address be published in the volume of *Proceedings*, without the approval of the Board of Directors or the Executive Committee.

LINCOLN P. GOODHUE, of Chicago: With reference to Article VI, which has been passed by: Am I right in believing that final action on Article VI was omitted intentionally or has it been adopted? Discussion was had as to a portion of Section 1 in Article VI; then the Chair's attention was called by the Secretary to some rulings; no further attention has been paid to Article VI: is that correct?

PRESIDENT PEARSE: The Chair is informed that that is correct. If no objection is heard, the Chair will entertain at this time a correct motion for the adoption of Article VI, which has been discussed heretofore. The Chair hears no objection.

Motion duly made, seconded, and carried.

MR. OWEN: Now the question arises as to Article VIII. I move that the substitute for Article VIII be adopted, as proposed by members, and printed, leaving out the word "permanent," where it has reference to "permanent Secretary," as follows:

ARTICLE VIII—PROCEEDINGS

SECTION 1. The proceedings of the meetings of the Association, the Council, and the departments shall be published under the direction of a committee consisting of the President, the First Vice-President, and the Secretary, the First Vice-President acting as chairman of the committee; *provided*, That in the opinion of the Executive Committee the funds of the Association warrant the publication. Each member of the Association shall be entitled to a copy of the *Proceedings*. Associate members must make written application to the Secretary on or before November 1 for a copy in order to obtain it. Corresponding members, and active members whose dues are paid, will receive the published proceedings without written application.

SEC. 2. No paper, lecture, or address shall be read before the Association or any of the departments in the absence of its author, without the approval of the President of the Association or of the departments interested, nor shall any such paper, lecture, or address be published in the *Proceedings*, without the approval of the Executive Committee.

Motion seconded and duly carried.

MR. SPRINGER: Move the adoption of Article IX of the committee's report

Motion seconded.

ARTICLE IX—ELECTIONS, QUORUM

SECTION 1. The certificate of membership, in connection with the published list of active members, shall be accepted as evidence that members are entitled to vote.

SEC. 2. Representatives from twenty-five states and territories shall constitute a quorum in all meetings of active members and of the Board of Directors.

MR. SCHULER: With reference to Section 1 of Article IX, is that reference to the effect that a member must carry his certificate of membership, together with a published list? In other words, it means no admission if the names are not on the list; cutting out everybody whose name is not on the list.

PRESIDENT PEARSE: The Chair understands that the published or official list may be consulted in connection with a certificate of membership; that is, if any case arises in which the certificate of membership is not considered sufficient evidence. It may also be possible that a member does not have his certificate of membership and yet his name may appear upon the list.

A MEMBER: Is it necessary that a member's name appear upon the list and also that he have his certificate of membership?

MR. OWEN: Is it to be understood a name is considered "published" only when printed?

PRESIDENT PEARSE: The Chair is of the opinion that an error has been made and the word "official" should appear. We can consider the question.

MR. SCHULER: Move to strike out the word "published" and make it "official."

A MEMBER: Motion seconded.

MR. OWEN: I believe in striking out the words "in connection with the published list of active members." The certificate of membership should be sufficient evidence of the right to vote.

MR. SCRIBNER: Does the word "published" mean "printed"?

MR. SCHULER: Certainly, it means printed; I don't see why there should be any objection to striking it out.

PRESIDENT PEARSE: Moved and seconded that the word "official" be inserted for the word "published."

MR. OWEN: Why couldn't we strike out the words "in connection with the published list of active members"? I make that as an amendment to the motion.

A MEMBER: I second the motion that the words "in connection with the published list of active members" be stricken out.

MR. SCHULER: It seems to me that there was something said a few moments ago that whenever any member of this Association proceeds to the hall where he wants to vote, he will have to show his certificate of membership for the year and it seems to me that certificate, signed by the Secretary and carried on his person, with the official list, would be better, as he might lose his certificate of membership and if he didn't have it he couldn't get in.

MR. SPRINGER: A suggestion has been made to this effect: If you lose your certificate of membership you might be in the same condition and predicament that some of the persons who are present were today, when they had to be admitted by a committee who had no other evidence than the official list of members gotten up by the Secretary, and I think it would be better to retain both, with the word "official" inserted instead of "published."

PRESIDENT PEARSE: I will put the motion as to striking out the words "in connection with the published list of active members."

Whereupon the motion was duly put and lost.

PRESIDENT PEARSE: Now we will vote on the motion to insert the word "official" instead of the word "published," making it read "official list of active members."

Whereupon the motion was duly put and carried.

MR. SPRINGER: I move that Article X of the National Education Association committee's report be adopted as follows:

ARTICLE X—AMENDMENTS

SECTION 1. These By-Laws may be altered or amended at the annual business meeting of the active members by unanimous consent, or by a three-fourths vote of the active members present if the alteration or amendment shall have been substantially proposed in writing at the annual business meeting next preceding the one at which action is taken, and due announcement has been made of the proposed action.

SEC. 2. Any of the provisions of any Section of Articles VI or VII of these By-Laws may be suspended for a single session of an annual meeting by a vote of three-fourths of the active members present.

A MEMBER: I second the motion.

PRESIDENT PEARSE: Moved and seconded that Article X be adopted.

MR. OWEN: There is one particular in which I wish to move a change. I observe that Article X, as appearing in the suggestions of members, is not parallel with Article X in the report of the National Education Association committee. Therefore in order to keep the matter clear, I would like to make a motion that Article XI of the members' suggestions be substituted for Article X of the National Education Association committee's report, and that it be renumbered Article X. I wish to read another change in the third line of Article XI in the members' substitute: "By a two-thirds vote of the active members present" is used instead of as it appears in Article X of the National Education Association report, "By a three-fourths vote of the active members present." The word "two-thirds" is used instead of "three-fourths."

ARTICLE XI—AMENDMENTS

SECTION 1. These By-Laws may be altered or amended at the annual business meeting of the active members by unanimous consent, or by a two-thirds vote of the active members present if the alteration or amendment shall have been substantially proposed in writing at the annual business meeting next preceding the one at which action is taken; due announcement of the proposed action shall be made in the annual published proceedings.

MR. SCRIBNER: I second the motion for the adoption of the substitute.

PRESIDENT PEARSE: Moved and seconded that Article XI, as proposed by the members' committee, and amended, be substituted for Article X of the National Education Association committee, and that it be numbered Article X. Are you ready for the question?

MR. OWEN: Before we proceed I would make the suggestion that Article X of the members' substitute as printed, be referred to a committee as has been done with other portions of the report. I make that as an amendment to the motion.

A MEMBER: I second the amendment.

Amendment carried.

Whereupon the motion to adopt as amended was duly put and carried.

PRESIDENT PEARSE: Now a motion is in order for the adoption of the By-Laws as approved *seriatim*, of course with the exception of those parts which have already been referred for action in one year.

MR. SPRINGER: I think the question of the adoption of these substitutes is one that requires the utmost care. I have written here a form of motion which I think covers the case, to this effect: I move that the By-Laws, as substituted for the report of the committee on proposed amendments appointed at the Denver meeting, which report was received at the Boston meeting, and at the San Francisco meeting laid on the table to be acted upon after one year, be now adopted as a whole.

That recites the history and gives the legal status of the situation.

Whereupon said motion was duly seconded and carried, the chairman declaring the By-Laws so adopted, the By-Laws of the National Education Association of the United States.

D. B. JOHNSON, of South Carolina: In accordance with the Constitution, I have a notice of an amendment to offer:

PRESIDENT PEARSE: Mr. Johnson.

MR. JOHNSON: This amendment under the rules is to lie on the table for a year and then be considered at the next meeting.

In order to preserve the national character of the National Education Association and to maintain the allegiance of all the teachers of all the states of the United States and thus insure the continued usefulness of the Association to the cause of education in this country, the President, Vice-Presidents, and other elective officers of the Association shall be voted for by states and territories, each state and territory being given its fair and just quota of votes in accordance with the rules governing the representation of each state and territory now in force, for the presidential conventions of both of the great parties; the vote of each state and territory being cast by the director of the state or territory in accordance with a majority vote of the active members in attendance upon the Association from each state and territory; *provided*, No state or territory shall be entitled to vote a greater number of votes than the number of active members enrolled in that state or territory; the election of President and other elective officers of the Association being determined by a majority of the votes thus cast in the meeting of the National Education Association held for the election of such officers.

A MEMBER: I move the resolution be referred according to rule.

Whereupon the motion was duly seconded and carried.

MR. HALL: I offer the following resolution:

Resolved, That the President of the National Education Association be and he is hereby authorized to appoint a committee of five active members of the Association to prepare recommendations for amendments to the Charter of the National Education Association and this committee be instructed to report its recommendations at the next meeting of the active members.

A motion was made and seconded to adopt the resolution.

S. Y. GILLAN, of Wisconsin: Mr. President.

PRESIDENT PEARSE: Mr. Gillan.

MR. GILLAN: As a substitute for Mr. Hall's motion, I move, according to rule, that the President appoint a committee of five members whose duty it shall be to present to the active members at their regular meeting in 1913 a draft of proposed changes, amendments, alterations, or other modifications in the act of Incorporation of the National Education Association of the United States, approved by special act of Congress, June 30, 1906; such draft of proposed changes, if approved by a majority of the active members voting at the regular meeting for 1913, or such part thereof as may be so approved, to be presented to the Sixty-third Congress of the United States at its first session, with the formal request of the active members of this body that such changes, amendments, or alterations be enacted into law as a part of the said Act of Incorporation. Said committee to file their report, not later than May 1, 1913, with the Secretary, who shall mail a copy of the report to each active member, not later than June 1, 1913.

MR. SPRINGER: I wish to call the gentleman's attention to one phrase, I think he says "a majority vote." I think that is a two-thirds vote according to our present Articles of Incorporation. I make the suggestion as to that change.

PRESIDENT PEARSE: This Association has no definite rule as to requesting amendments to its Articles of Incorporation by a majority vote.

A MEMBER: I second the motion to substitute as originally made.

The maker of the original motion accepted the substitute.

Whereupon the substitute motion was duly put and carried.

MR. GILLAN: I wish to offer an amendment to the By-Laws, simply to get it before this meeting, that it may be voted upon one year from now, as follows:

ARTICLE IX

If not less than thirty days before any regular meeting of the Association, a petition signed by not less than one hundred active members, requesting the resignation of an officer, shall be filed with the Secretary, unless such officer shall present his resignation at the regular meeting of the active members next following the filing of such petition, a recall vote shall be taken, and if two-thirds of the active members voting shall favor the recall of such officer, a vacancy shall thereupon exist, to be filled in such manner as provided for filling vacancies; and an officer thus recalled shall be ineligible for appointment or election to the same office during a period of two years after such recall.

By motion duly made and carried the said amendment was referred to a committee for action next year.

MISS HALEY: I have here an application for a new department entitled "Classroom Teachers' Department."

PRESIDENT PEARSE: Will you read it?

MISS HALEY (reading):

We the undersigned, classroom teachers, active members of the National Education Association, hereby make application to have a new department to be known as the "Classroom Teachers' Department" added to the list of departments of the National Education Association:

Grace DeGraff, Portland, Ore.
Lily E. M. Patterson, Princeton, Ill.
Mabel F. Smith, Topeka, Kans.
Alma Reed, Eudora, Kans.
Ida Reed, Benton Harbor, Mich.
Lura A. Griswold, Kansas City, Mo.
Emma A. Dodson, Terre Haute, Ind.
Bertha Dodson Neyhouse, Poseyville, Ind.
Edna May Gifford, Elgin, Ill.
Lucinda E. D. Lafuse, College Corner, Ohio
Genevieve Washburn, Minneapolis, Minn.
Mary A. Starkey, Milwaukee, Wis.
Helen M. Holden, Milwaukee, Wis.
Katherine C. Farley, Milwaukee, Wis.
Katherine J. Muller, Minneapolis, Minn.
Margaret E. Cooper, St. Paul, Minn.
Julia Holth, St. Paul, Minn.
Nellie Minehan, Milwaukee, Wis.
Mary E. Hannan, Milwaukee, Wis.
Mary C. Kerr, Baltimore, Md.
Grace Baldwin, Minneapolis, Minn.
Julia H. Vaughan, Minneapolis, Minn.
Lydia L. Hazleton, Minneapolis, Minn.
Ida L. M. Fursman, Chicago, Ill.
Mary Cone Harris, Minneapolis, Minn.
Annie L. Donohue, Minneapolis, Minn.
Rose E. Rafferty, Chicago, Ill.
Minnie L. Spawr, Chicago, Ill.
D. W. Springer, Detroit, Mich.
Elizabeth A. Smyth, Baltimore, Md.
Mollie K. Hobbs, Baltimore, Md.
Martha Stromberg, Baltimore, Md.

A MEMBER: I move it be referred to a committee.

MISS HALEY: Under the By-Laws this body has power to receive such application and act upon it next year.

Whereupon motion was duly made and carried that the application be received and referred to a committee for action next year.

A MEMBER: I move we adjourn.

PRESIDENT PEARSE: The Chair would not feel it right that this meeting should come to a close after the members have been sitting here all thru this hot afternoon, transacting the vital business of this Association, and that the members should separate without receiving the sincere thanks of the Chair. Not in many years, in fact never before in the history of this Association, so far as my knowledge goes, and it goes back thru most of the meetings to the one presided over by our good friend Dr. Bicknell, has the Association sat so assiduously and continuously, the members giving their best attention to the business of the Association, as they have done this afternoon.

I want to say I am very slow to believe that these staying qualities are possessed only by the teachers of Illinois. I have no doubt that their representatives are here, but I am conscious that there are many here from other states who have shown that they also are "stayers" and not "quitters"; and they have stayed here and attended to the important business of the Association.

I want to thank all the members of the Association, these faithful brothers and sisters at my right and left, and these equally faithful but more conspicuous, who sit behind me,

for the assistance that they have rendered the Chairman at this meeting, in the conduct of the important business which has occupied us this afternoon.

Motion for adjournment is now in order.

A MEMBER: I move we adjourn.

A MEMBER: Second the motion.

PRESIDENT PEARSE: It has been moved and seconded that we adjourn. Before we adjourn, I ought to transmit one other item of news to you. I requested especially, and supposed that my request would be complied with, that the excursions for our benefit which were going out this afternoon, be held until after the business meeting. I informed you at the last meeting that this would be done. The Chair must confess himself to be a hapless prevaricator in that announcement; I understand that the excursions have departed without us, and those of us who have attended to the business of the day have done so at the sacrifice of a cool and sociable ride. I commiserate you but I also compliment you upon your staunch loyalty and your faithfulness to the business of your Association.

The meeting stands adjourned until the next regular annual business meeting.

Whereupon the annual business meeting of active members for 1912 adjourned, sine die.

IRWIN SHEPARD, *Secretary*

Approved,

CARROLL G. PEARSE, *President*

MINUTES OF THE MEETING OF THE BOARD OF DIRECTORS OF THE NATIONAL EDUCATION ASSOCIATION FOR THE YEAR 1911–12

CHICAGO, ILL., MONDAY, JULY 8, 1912

The meeting was called to order in the Masonic Hall of the Auditorium Hotel by President Pearse at 9:30 A.M. The roll was called, resulting as follows:

Present: Directors Carroll G. Pearse, of Wisconsin; Katherine D. Blake, of New York; Irwin Shepard, of Minnesota; John W. Cook, of Illinois; Edwin G. Cooley, of Illinois; Oscar T. Corson, of Ohio; James M. Greenwood, of Missouri; Lorenzo D. Harvey, of Wisconsin; James Y. Joyner, of North Carolina; Charles I. Parker, of Illinois; Joshua Pike, of Illinois; A. R. Taylor, of Illinois; Ella Flagg Young, of Illinois; John H. Phillips, of Alabama; A. J. Matthews, of Arizona; George B. Cook, of Arkansas; James B. Ragan, of Colorado; William M. Davidson, of District of Columbia; Clem Hampton, of Florida; Grace M. Shepherd, of Idaho; William H. Campbell, of Illinois; Thomas A. Mott, of Indiana; O. P. Bostwick, of Iowa; John MacDonald, of Kansas; Thomas D. Boyd, of Louisiana; Robert J. Aley, of Maine; Robert J. Fuller, of Massachusetts; E. E. Scribner, of Michigan; C. G. Schulz, of Minnesota; E. E. Bass, of Mississippi; John R. Kirk, of Missouri; G. W. A. Luckey, of Nebraska; W. E. Garrison, of New Mexico; Grace C. Strachan, of New York; F. M. Harper, of North Carolina; Edward M. Van Cleve, of Ohio; William F. Ramey, of Oklahoma; L. R. Alderman, of Oregon; Reed B. Teitrick, of Pennsylvania; D. B. Johnson, of South Carolina; J. J. Keyes, of Tennessee; George N. Child, of Utah; C. E. Beach, of Washington; M. P. Shawkey, of West Virginia; Emma J. Gardner, of Wisconsin.

On motion, it was voted that the following be elected to fill vacancies caused by resignations of directors:

James Ferguson, of California, in place of Mark Keppel, resigned.
Arthur D. Call, of Connecticut, in place of F. A. Verplanck, resigned.
W. H. Nye, of Montana, in place of C. A. Duniway, resigned.
W. J. Hunting, of Nevada, in place of Mrs. L. C. Booth, resigned.
George A. McFarland, of North Dakota, in place of W. E. Hoover, resigned.
C. G. Lawrence, of South Dakota, in place of M. M. Ramer, resigned.
D. S. Furman, of Texas, in place of Felix E. Smith, resigned.
Ira B. Fee, of Wyoming, in place of Charles O. Merica, resigned.
B. K. Purdum, of Maryland, in place of A. C. Willison, resigned.

Of these, the following were present: Directors James Ferguson, of California; B. K. Purdum, of Maryland; W. H. Nye, of Montana; George A. McFarland, of North Dakota; Ira B. Fee, of Wyoming.

Total number of directors present, fifty.

PRESIDENT PEARSE: The minutes of the last meeting of the Board of Directors will now be read.

SECRETARY SHEPARD: Mr. President, I have the minutes here as printed. They have been printed in the *Yearbook* and are doubtless well known to all the members. Do you wish to have them read?

PRESIDENT PEARSE: What is the pleasure of the directors?

DIRECTOR E. E. SCRIBNER, of Michigan: I move that the reading be suspended and the minutes approved as printed.

Motion seconded and carried.

PRESIDENT PEARSE: Since there seem to be no corrections, they will stand as printed. My attention has been called to a communication which it is desired to present on behalf of the National Council. I have asked Secretary Aley of the Council to present it at this time.

DIRECTOR R. J. ALEY, of Maine: Mr. Chairman, at the meeting of the Council held in San Francisco one year ago, the constitution of the Council was changed slightly, and thru an oversight at that time notice of the change was not brought to the attention of this body for approval. I desire at this time, on behalf of the Council, to bring before the Board of Directors the change and ask for the approval of this body.

President Keyes of the Council, perhaps fifteen months ago, sent out a letter to all members of the Council, raising the question as to whether it might not be better to have the meeting of the Council at a time different from the meeting of the National Education Association; the reason for that being that many of the most valuable members of the Council, due to the great growth of the summer-school notion over the country, these men being in demand for work in summer schools, find it impossible to attend this meeting. President Keyes received from 118 of the 120 members of the Council letters; 114 of these replies were favorable to the proposed change to a different time. In view of that almost unanimous vote by letter of the members of the Council, a committee was appointed at San Francisco to propose changes in the constitution. The change (and the other changes are simply minor ones to bring them into harmony with that) is in Article III, in regard to meetings:

There shall be a regular annual meeting of the Council held in connection with the Department of Superintendence of the National Education Association, or at such other time and place as the Executive Committee of the Council may designate.

If you will allow me to explain, I will say that that was put in that particular form so that in case the Department of Superintendence might see fit to go at some time to some remote part of the country, it would be possible for the Council to arrange a meeting more centrally located. The change does not bind the Council to hold its meeting at the time of the National Education Association, altho the intention is that in general it may be. "There may be special meetings of the Council," etc. There are no other changes except the changes made by that, which provide for filling of vacancies and the election of new members at the regular annual meeting, as provided for by the change. The proposed changes are printed in the annual volume of *Proceedings*, and doubtless all of you have had occasion to look them over.

Mr. Chairman, I move that the Board of Directors approve this change in the constitution of the Council.

A DIRECTOR: I second the motion.

DIRECTOR KATHERINE D. BLAKE, of New York: Does that mean that there will be no meeting of the Council in connection with the summer meeting?

DIRECTOR ALEY: Not necessarily. The same provision for special meetings that has existed from the formation of the Council still remains. It merely provides that the regular annual meeting may be held at the time of the Department of Superintendence or at such other time and place as the Executive Committee may provide. It does not forbid its being held with this meeting.

DIRECTOR ELLA FLAGG YOUNG, of Illinois: I did not quite understand when the officers were to be elected. Mr. Aley spoke of the annual meeting. It seems as if that is a movable feast.

DIRECTOR ALEY: I will read that clause again:

There shall be a regular annual meeting of the Council held in connection with the Department of Superintendence of the National Education Association or at such other time and place as the Executive Committee of the Council may designate.

DIRECTOR YOUNG: That makes it movable. It will be held at the time of the National Education Association or at such other time and place as the Executive Committee of the Council may designate.

DIRECTOR GRACE C. STRACHAN, of New York: That is, one might be elected secretary and serve for one month on a certain occasion, and at another time serve for nine months, or eleven months.

DIRECTOR ALEY: Your point of view is well taken, except as to the time. The officers are elected for three years, thru three annual meetings.

DIRECTOR STRACHAN: I thought it was for one year, as in the other departments, and the general Association. I should think that would be a serious difficulty in this amendment, the fact that there is really no meeting that can be called an annual meeting. It may be held one year in September and another year in October or June.

DIRECTOR SCRIBNER: I think the secretary of the Council explained the clause following. Won't you make that explanation again?

DIRECTOR ALEY: The idea of the Council was that in all cases the meeting would be held in connection with the meeting of the Department of Superintendence unless the department should go to some remote part of the country, as has been the case occasionally, where in all probability there would be a very small attendance of the Council. In that case it would be thought wise to hold a meeting at some central point, and the time would not necessarily be on the same dates as the National Education Association, but within a period of ten days preceding or following, at the same time of the year.

DIRECTOR STRACHAN: Of course that does not appear in the amendment, and there is nothing that would fix it. I should like to ask whether the attendance at the National Council is greater at the Department of Superintendence meeting or at the large meeting, as we consider this?

DIRECTOR ALEY: Of course we have only had one test of that, and that was at the St. Louis meeting. I have served as secretary at four meetings, and the attendance at St. Louis was very much larger than at any of the others. Of the 120 members, all were present at St. Louis but 35. At most meetings the attendance is much smaller than that; at all of the meetings, in fact, which I have attended.

DIRECTOR STRACHAN: Do superintendents form the majority of the members of the National Council?

DIRECTOR ALEY: I could not answer that offhand.

DIRECTOR STRACHAN: I thought that might explain the situation.

DIRECTOR ALEY: I should say that superintendents and normal school people perhaps do constitute the large majority.

DIRECTOR STRACHAN: Because teachers who are members would find it more difficult to get away in February than the superintendents.

PRESIDENT PEARSE: Are there further remarks?

DIRECTOR T. D. BICKNELL, of Rhode Island: Being somewhat familiar with the purposes of the Council and its organization, I think that the feeling was then that the Council should hold a very intimate and close relation to the annual meetings of the National Education Association, and these meetings have always been thus held. It seems to me that this separation of the two would weaken its influence and weaken its relations to the main body. I have only had this moment to think of it, but it seems to me that it is a deviation from the original principles of the Council and it seems to me also that it woud weaken the influence of the Council itself. While at any one particular meeting there may have been a large attendance, it seems to me that on the whole its association with the national meeting would give it a large value and also give to it a larger attendance.

PRESIDENT PEARSE: Are there further remarks?

DIRECTOR J. R. KIRK, of Missouri: There is a new element being injected into education that we cannot avoid recognizing, and that is the summer-school movement, reaching from six weeks to twelve weeks, in all the large universities between the Alleghanies and the Rockies, at least, and perhaps extending somewhat outside of those regions; and the faculties of the normal schools and of these large universities are very largely engaged in conducting the summer schools, so that it is practically impossible in the state normal schools and many of the state universities for the faculty members to get away to attend a summer meeting, especially in the case of the summer meeting being earlier than the 20th or 30th of July. But there is a new birth in education which is sending from many

cities the very pick of the flock, the choicest and most progressive of the teachers, the rank and file of teachers, into these summer schools the country over. We found in the Normal School Department at St. Louis, I believe, a larger number of normal-school faculty members (not presidents, but faculty members) than had ever been seen in a summer meeting of the Normal School Department, and I apprehend that we shall be worried a good deal in adjusting not only these several departments to that new condition in education, but it is very materially affecting the attendance of the National Education Association as a whole. It is doubted whether such an attendance can ever be had at the summer convention again as we used to have prior to four or five years ago. I merely mention those as features that are unavoidable.

Director G. W. A. Luckey, of Nebraska: I want to call attention to the fact, which President Aley has brought out, that there was an almost unanimous verdict of the Council in their own meeting that it would be important or would be valuable to change the meeting to the winter meeting, and it seems to me, other things being equal, that it would be a wiser policy to allow any organization to control itself than to control it from the outside, since they desire to make this change in their work.

It doesn't seem to me, and has not for a number of years, to be very damaging to the National Education Association as a whole to have a reduction of departments at this summer meeting. That has been one of the difficult things to attend to, it seems to me, for a number of years. We have so many departments, and our interests are so divided, that it is a difficult thing to attend to all of them, and so this change would not be a bad thing, probably, for the National Education Association itself.

There is one other feature of the National Education Association, in the line of what President Kirk has said, that has appealed to me very keenly in the last few years. The men, especially, and the women who work in the Council and in the Department of Higher Education and some other more advanced lines, are very strenuous in their work for at least nine or ten months in the year. Their work is trying. They are in demand, too, in the summer sessions. They are held at home. I find, too, that a great many men and women, when they get thru with their year's work, strenuous as it has been, feel that they can help their people more, and help other people more, by taking a rest during the summer or by travel and by study. Now, unfortunately the National Education Association comes at a time when you have to give up your study work or your travel work, because it is a month after your school closes before your meeting comes, and then it is a month or more after that before you are called back to your work. So you cannot go very far from home, and that is one thing that is breaking in upon the attendance at the National Education Association. Men prefer to go to some place where they can sit down in quiet study and reading or travel.

So it seems to me that this motion is quite in place, and it probably would be a good thing for the Council and not a bad thing for the National Education Association in reducing somewhat the number of interests that we have at this big meeting.

Director Bicknell: The point has been brought out clearly that was lying back in my mind. I hear from so many sources the suggestion that the disintegration of the National Association has begun, and if it has, of course this is along the line of the movement, which I should regard as one of the most unfortunate things in the history of education in this country. Of course, as to the matter of time limit, as to place and time of meeting, those are questions that are variable. But if, as at St. Louis, a month of the year, or several weeks of the year, could be obtained whereby the whole week or two weeks could be devoted to educational work, when the teachers were less disposed to travel or various interests which might occupy their attention, it would be of great value. But to me the most unfortunate thing that could occur to this Association, or to the country in educational work, would be the disintegration and destruction of this Association. I have been thru one or two crises in its history, and I think we are approaching another. I see so many signs of it that for one I want to put myself on record as standing for its

unity, its perpetuity, and its greater strength instead of its weakness. I therefore shall vote against the proposition on the grounds that I have named.

Director Aley: May I say just one word? I of course have not been connected with this Association the long time that Director Bicknell has, but I must very strongly disagree with him that there is any disintegration of this Association in sight. I do not believe that for a minute. I believe that the great meetings of the Department of Superintendence which are held at a different time have in no wise detracted from the meeting of the National Education Association. I think, on the other hand, they have increased interest in the National Education Association. Those meetings are always considered as a part of the National Education Association. Whenever the meetings of the Council are held, the thing that will be prominent is that it is the National Education Association, not a separate thing apart from the National Education Association. Further than that, I must believe that having the meeting at a time when it will accommodate more members will not mean a smaller attendance of Council members at this meeting. I believe that there will be at this meeting just as many Council members as would be here if the Council had its annual meeting at this time. I do believe that, with the strenuous work of the Council out of the way, the members of the Council who do attend this meeting, and who, I am convinced, will attend in as large numbers, will be able to give far more attention to the work of this meeting than when they come here and have six or seven long sessions of the Council that use up their strength and energy. I must very strongly disagree with the conclusions that Mr. Bicknell has reached.

Director J. W. Cook, of Illinois: There are two considerations that appeal to me in favor of this proposed change of time. First and most decidedly, the strongest consideration is the fact that the Council wishes it. You cannot run against the wishes of the Council in this matter and hope to have a successful meeting. Men will simply stay away. You cannot even lead them to the water, much less can you make them drink when they are there.

Secondly, the meeting of the Council occurs, as at present organized, immediately at the close of the year. We all come here already greatly overburdened with cares and with weariness incident in large part to the greatly increased duties that devolve upon us near the close of the year. I need not say that it is very natural for people to defer preparation for this meeting until a month or so before the meeting and then there is that great accumulation of duties. We have our commencement time coming on, and our trustees' meetings, and we are arranging our budget, and everything of that kind—all of those vital details that must be attended to with such scrupulous care and exactness and that will of course absorb our time and push aside that belated preparation for the meeting.

I may add a third consideration, which just occurs to me. I think, Mr. President, that we are all struck with the very great excellence last year, as we have been before, of the exercises, papers, and discussions at the meeting of the Department of Superintendence. The St. Louis meeting was certainly a great meeting, as there have been great meetings before. That means that it comes somewhere near the midyear period of comparative liberty from the great stress of our duties that we can devote to the preparation for the meeting; and altho I am not prepared to say positively, of course, that such will be the result, I believe that the programs of the Council, the exercises of the Council meeting, will be greatly improved by the change in time. That is a matter that will have to be demonstrated by actual experience but I am at least in favor; on my own part, I will go anywhere at any time that seems best, and at least indicate by my presence that I am in sympathy with it, tho I may not have had the opportunity to prepare work. Still I believe that the value of the Council will be materially increased by this change of time. I cannot think that the holding of the meeting of the Council at a different time would in any way threaten the life or vitality or perpetuity of the Association.

Director Bicknell: I wish William Torrey Harris were here. His idea was that the National Council stood as a highly trained body of experts which would lend their

influence and the influence of their discussion to the main Association. That was the main purpose of the formation of the Council. It was supposed to be part and parcel of the annual meeting and was held just in advance of it, not held concurrently. I remember the second meeting we held at Atlanta and it was a very successful meeting, and it seems to me that we cannot divorce the two without weakening both. I feel that way; I must vote that way.

Calls of "Question!"

DIRECTOR YOUNG: Excuse my speaking again. The point that I raised was not with regard to the Council meeting elsewhere from the place at which the National Association meets, but that the Council seemed to meet whenever it pleased. Its annual meeting was uncertain, and I feared that some time the secretary might fail to put in the word "annual" and I should not be there to vote at the annual meeting. I have thought further, since the discussion has been going on, of the great loss to the teachers of this country that will come from the separation of the Council from the general meetings. The argument which I brought to bear on the teachers of Chicago, and which increased very largely our Association membership, was due to my going back in my own experience to the early meeting of the Council. In all my educational career I have never attended anything else that equaled those early meetings and their influence upon my educational thought, and I urged upon the teachers to be here and hear the discussions of the leading men and women of the country. But alas! if the leading men and women of the country are busy teaching in the normal summer schools and college summer schools, then those teachers have stayed here to see only us, which I think, is a great misfortune. We have to bear in mind, after all is said and done, that the great aim, as I see it (I may be mistaken), of this Association is the uplifting of the teaching corps of the country. It is a pity that this winter the leading people connected with colleges and normal schools and superintendencies gave their papers at St. Louis, and the teachers were not there. The teachers will be here this summer. I have been thinking, since I have sat here, that for many years I have realized what Mr. Kirk said, that there is a great danger threatening us from the summer schools, and I have been wondering why it would not be possible to organize a movement which would lead all boards of education thruout the country to give two weeks in September or October, to close the schools, paying the salaries, and letting the teachers attend this Association, and then all of the teachers that wish to could attend the summer schools, and all of the members of schools who wish to recoup their pocketbooks by teaching in the summer schools could do so, and it would have no effect upon the National Association meeting.

DIRECTOR SCRIBNER: I move that the part of Article III as read by the Secretary be cut at the first sentence, and that the clause "or at such other time and place as the Executive Committee of the Council may designate," be stricken out.

DIRECTOR BICKNELL: I should like to see that vote put thru if that is to be a regular meeting. I think the annual meeting should be held in connection with this body.

PRESIDENT PEARSE: If the director thinks another amendment is needed, I suggest that he make it.

DIRECTOR T. D. BOYD, of Louisiana: I should like to ask for information. Several amendments have been read. I am not sure that we understand the question exactly. The constitution now requires the Council to meet during this meeting, and yet it held a meeting during the convention and also at St. Louis.

DIRECTOR ALEY: The annual meeting has just been held. A special meeting was held at St. Louis.

DIRECTOR BOYD: Why not let the amendment provide for two regular annual meetings, one to be held at this time and in connection with the general convention, the other to be held at the Superintendence convention, and then special meetings whenever the Council desires? As I understand the thing, the meeting of the Department of Superintendence is getting to be just as great an affair as this convention, and it strikes

me that the trend of events is leading to the holding, perhaps, of this convention in the winter time to take the place of the Department of Superintendence; and it seems to me that it would not be a very violent change in the constitution to direct the Council to hold two regular annual meetings, one at the regular convention in the summer and the other at the meeting of the Department of Superintendence in the winter.

PRESIDENT PEARSE: Is there any further discussion of the matter?

DIRECTOR T. A. MOTT, of Indiana: May I ask for information? Have we the right to change that constitution, or simply to approve or disapprove? Could we change the constitution of the Council?

PRESIDENT PEARSE: Do you ask that of the Chair as a matter of ruling? I should say that this body can only approve or disapprove.

DIRECTOR ALEY: That is correct.

DIRECTOR MOTT: If we don't quite approve of that amendment, we should refer it back to the Council. Personally I am very much in favor of meeting both times, with the superintendents and here with this meeting, because there were large numbers of the Council present both times, and each time is an opportune time to have a good meeting.

DIRECTOR SCRIBNER: It seems to me, Mr. President, that some of the speakers fail to understand that the Council is a co-ordinate branch of the National Education Association, and it has not been the purpose of those who have had the matter of amending the constitution in hand in any way to deprecate this meeting, and there is nothing to prevent the Council having a regular session at the annual meeting of the National Education Association as well as with the Department of Superintendence.

PRESIDENT PEARSE: If we do not approve the constitution proposed by the Council, if we feel it needs some further putting into shape, it will be proper for us to return it to the Council for their further consideration.

DIRECTOR BICKNELL: I move that we do refer it back.

PRESIDENT PEARSE: Director Greenwood has the floor.

DIRECTOR J. M. GREENWOOD, of Missouri: The Council has for many years been composed of many of the persons here present, and under the former arrangement—generally meeting on Friday before the Association commenced the next Monday—many of us had to leave our work and come two or three days in advance of the meeting of the National Education Association. I should judge there would be plenty of opportunity for the usual meeting with the Department of Superintendence having a regular program with discussions and reports at times that would not conflict materially with the Department of Superintendence. The second thought was, then, to hold a short meeting of the Council, just as was done at this session last Saturday, and finish up what business was necessarily left to be transacted. Now, as a matter of fact, you know that very few persons, except some that are interested, ever attended the meetings of the Council. Last Saturday I think I could have counted fifty persons present. Then again, the members of the Council, many of them, are on different programs of the meetings which interfere with the other department meetings of the Association. As I understand it, there is no intention to cut off from the general Association, but that we might be more efficient in our work and give the members of the Council opportunity to attend the department meetings and the general sessions of the Association. I have been in the Council when there would not be fifteen persons present, and the last meeting, in which important matters were transacted, there was hardly a quorum to finish the unfinished business. This was the reason.

DIRECTOR COOK: I desire instruction. As I understand the motion, it was offered to release the Council of certain embarrassment arising from the fact that it did not observe technicalities. In the first place, is it possible for this Board of Directors to relieve the Council from the embarrassment which it now feels because of its neglect of that technicality of giving notice? Then I wish to ask further whether that would be a genuinely regular enactment if we should by a vote endeavor to relieve the Council from that embarrassment.

PRESIDENT PEARSE: The secretary of the Council will answer as his judgment and information direct.

DIRECTOR ALEY: Just as soon as the officers of the Council discovered that the matter of bringing this before this body at San Francisco had been overlooked, it was immediately decided to work under the old constitution or by-laws of the Council: that is, that the meeting at St. Louis should be a special meeting. The regular meeting of the Council, at which all business was transacted, occurred Saturday here, which was a regular meeting under the old constitution, so that there is no particular embarrassment to be relieved. The Council now asks that the changes made in their by-laws a year ago become effective for future action by the approval of this board.

DIRECTOR BICKNELL: The Council is not a co-ordinate body. I do not so understand it. It is a subordinate body, formed at Chautauqua, N.Y., in 1880, by the National Association, because the constitution and by-laws were approved by this body. It was the child of the National Association and belongs to it as its child, and has full control of that constitution and general management, so far as that goes. It seems to me that it would be worse than useless to have a nominal meeting in connection with this meeting. I have been present at a meeting of the National Education Association where there were not over fifteen or twenty present. That is true of the National Association. The National Council was its first movement forward, its first great movement forward. It was a magnificent movement, and around it and with it in the Association, as it belongs today, the Association will reach higher and greater things. It seems to me, if it be divorced and simply a nominal meeting held here it will be unfortunate. We ought to stand by our original plan and make the Council a part of this plan.

DIRECTOR ALEY: I may say that the meeting on Saturday was not a nominal meeting. It was a regular meeting with three sessions with splendid programs. I think everybody there will testify that as good programs were presented on Saturday as have been presented at any meeting, and there were more people at each of those meetings than were in attendance at San Francisco one year ago.

DIRECTOR LUCKEY: I should like to ask whether the purpose of the Council is not for the good of the people and for the help of the teaching corps of the country. I attended the meeting at San Francisco and I do not believe that we had at any one time two hundred members as an audience. At St. Louis I attended the meeting also and a great many of our teachers went there from my state and I am sure that the audiences would average twelve hundred. If we can give this information that we have to twelve hundred people at one time, rather than two hundred, it seems to me it is wise to make such a change.

PRESIDENT PEARSE: The Chair desires to call attention to the fact that we have a proposition before us to approve the constitution and by-laws presented by the Educational Council. We can approve or disapprove them or we can re-refer them.

DIRECTOR SCRIBNER: The motion is to approve. Question.

The motion was put and carried.

PRESIDENT PEARSE: The next business is the report of the Board of Trustees.

CHAIRMAN GREENWOOD: The report of the Board of Trustees, I think, has been distributed to all the directors. Probably most of you have read the report. It is brief, and I think all the principal facts in connection with the financial interests committed to the Board of Trustees are stated. As you will observe, there was an investment made in school bonds, $10,000 in Kansas City, Mo., school bonds. They were purchased at 95 cents on the dollar. These bonds fall due in 1925 and interest is payable semiannually. Probably I should make a personal statement here. For the purchase of the school bonds $10,000 had been set aside, transferred to the Permanent Fund; $9,500 of that was used for the purpose of purchasing these bonds, which purchase was concurred in by all the members of the Board of Trustees. The interest falls due July 1 and January 1. The $500 not used was transferred to a balance on hand of nearly $3,000 carried over from last year, making an unexpended fund now of about $3,300 or $3,400 to be invested in securities.

It is not worth while, unless you have some questions, to take further time in regard to this report. It is properly certified to by the examiner of securities. If there are any questions I should be very glad to answer so far as I can.

PRESIDENT PEARSE: Are there further questions? If not, the question is on the adoption of the report and placing it on file. If there is no objection, the report will be received and placed on file. The next order of business is the report of the Treasurer.

TREASURER BLAKE: It is not necessary for me to read this report, as it is in the hands of every director. I will spare you the statistics and will read only the suggestions that I have made.

I therefore recommend that the membership certificates in future be entirely in the hands of the Treasurer, that the Secretary acknowledge the payment of dues on a printed form stating that the Treasurer will send membership certificate later. This would give the Association a second roll of active members, and as the Treasurer's roll would be kept in a different place from that of the Secretary, it would remove the present danger of having the records completely destroyed in case of fire.

I recommend further that the bond for the Treasurer be reduced to a minimum. The Treasurer at present has no checkbook, and cannot draw on the funds of the Association. The $10,000 bond now issued is therefore unnecessarily expensive.

Lastly, I recommend that the present regulation limiting funds at the disposal of the state directors to $20 each be amended so as to allow the state director to draw on the Association for actual expenses incurred to an amount not to exceed 25 per cent of the annual dues of the active members in the state for the year of his administration. I make this recommendation on the advice of several successful business men as being in line with modern business methods. Such a policy would doubtless largely increase the membership and the income of the Association. That the present arrangement is unfair will be borne out by the following statistics of the San Francisco convention.

Of course this body can only recommend that, it cannot make any By-Laws or anything of that kind, but I suppose that you could adopt a regulation or recommend that the Trustees adopt such a regulation, the Board of Trustees having the power to make rules for the Secretary and Treasurer.

I do not know what body made the regulation that the annual allowance to state directors should be $20 apiece. I believe it was the Board of Trustees.

PRESIDENT PEARSE: Probably the Board of Trustees or the Executive Committee.

TREASURER BLAKE: Then that recommendation, if this body sees fit to approve it, could go to the Executive Committee for action. It is embarrassing to have members say, as has happened since the convention, "Where are the (naming a state) headquarters?" I think there are no California headquarters, and yet California this past year has had an enormous active membership. It does not seem to me that after entertaining us as royally as California did last summer the state director of that state should be allowed only $20 to pay for headquarters and so on. I am free to make this recommendation as I am not a state director.

DIRECTOR COOK: May I ask if the speaker is aware of the fact that the state teachers' associations in most of the states—in many of the states—make quite an ample appropriation for headquarters?

TREASURER BLAKE: You say "in most of the states," and then "in many of the states." I think "many of the states" is more accurate than "most of the states." I know in New York state that there was an appropriation under Mr. Downing's directorship. When Mr. Downing ceased to be state director the state of New York took no further interest in headquarters for the state of New York.

A DIRECTOR: Is it not true that the state directors have no right to use that money for anything excepting postage and stationery? They cannot use it for headquarters?

PRESIDENT PEARSE: That is correct.

TREASURER BLAKE: That may all be. I am not finding any fault with the way the money is spent. Anybody that spends only $20 can get but a small attendance from his state. I am saying that the state directors ought to be in a position to be able to

arouse interest by paying for headquarters and maintaining their states in proper standing. That is merely my recommendation.

The balance in the treasury is now over $5,000, and we have turned over to the general fund this year $10,000.

PRESIDENT PEARSE: As it seems to the Chairman, the recommendations fall under three heads: first, with reference to change in the duties and perhaps the title of the Secretary and Treasurer, which I suppose would be referred to the active members of the Association. The recommendation that the Treasurer's bond be reduced should go to the Trustees, and the recommendation with reference to the regulation limiting the funds at the disposal of the state directors might properly be considered by the new Board of Directors and the Executive Committee which will work during the next year. If such reference is satisfactory to the directors, it will be made. If other action is desired, what is your pleasure?

TREASURER BLAKE: It seems to me that the first recommendation should go to the Board of Trustees rather than to the active members. They have the ordering of the financial affairs of the Association.

PRESIDENT PEARSE: There is one other recommendation. It is for an arrangement for the issuing of the membership certificates by the Treasurer. Is there objection to the reference, or will you make some other suggestions if this is not satisfactory?

DIRECTOR A. R. TAYLOR, of Illinois: I move the reference to the different organizations which the Chairman has suggested.

The motion was seconded and carried.

PRESIDENT PEARSE: The report of the Treasurer, having been received with the proper certificates, is approved and placed on file unless objection is made.

PRESIDENT PEARSE: Reports of other officers. Has the Secretary anything to offer? The President has something to offer which he will present at this time:

Report of the President to the Board of Directors of the National Education Association:

It has not, in the past, been the custom for the President to submit a report at this time, tho the Board of Trustees and the Treasurer do so. There is, however, a good deal of business transacted thru the year by the Executive Committee, or by the President for them, on behalf of the Association, and there seem to be good reasons why the President, as the chief executive officer of the Association, should report such items as, in his judgment, ought to come to the directors in this way, with such comment as to him seems proper. The accompanying report is submitted in accordance with this view.

REPRESENTATIVES ACCREDITED TO NOTABLE EDUCATIONAL GATHERINGS AND FUNCTIONS

Invitations were received during the year from various educational institutions, and organizations of an educational or semi-educational character, requesting that the National Education Association be represented on important occasions by its principal officers or by delegates. In accordance with such invitations, the Association was represented as follows:

At the Third National Conservation Congress, Kansas City, Mo., September 25, 26, 27, 1911, by Hon. George B. Cook, state superintendent of public schools, Little Rock, Ark.; Professor E. C. Bishop, State College of Agriculture, Ames, Iowa; Hon. E. T. Fairchild, state superintendent of public instruction, Topeka, Kans.; Superintendent James M. Greenwood, Kansas City, Mo.; Professor J. L. McBrien, Extension Division, State University, Lincoln, Nebr.

The following resolutions were presented by your delegates to the Conservation Congress and were unanimously adopted by that body:

Resolved, That the children of the United States are recognized as the most precious resource of this nation, and that the federal Bureau of Education is the only agency for collecting, publishing, and distributing educational information thruout the country. We, therefore, urge that the national appropriations for studying problems involving the welfare of the nation's school children be made comparable in amount with those annually made for studying problems involving the welfare and conservation of the nation's material resources.

Resolved, That in a system of free schools all the children should be trained for good citizenship and for the useful industries; that owing to the rapidly changing and increasingly complex social and economic conditions now found in all sections of the Union, our public schools should make ample provision for instructing the youth of the land in the more important occupations in which our people are engaged, and parents and teachers should counsel together to determine, if possible, what vocation each child is best adapted to pursue.

Resolved, That the Vocational Education Bill now pending in Congress, providing for the training of teachers to give scientific instruction in the elements of agriculture in the rural schools, has our hearty indorsement, and we urge its speedy enactment.

At the inauguration of George E. Vincent, LL.D., as president of the University of Minnesota, Minneapolis, October 19, by the President of the Association.

At the inauguration of Ellen Fitz Pendleton, Litt.D., as president of Wellesley College, on October 19, 1911, by President Ellen M. Sabin, of Milwaukee-Downer College, Milwaukee, Wis.

At the celebration of the One Hundred Twenty-fifth Anniversary of the founding of the University of Pittsburgh, Pennsylvania, on February 27, 28, 29, 1912, by President William O. Thompson, of the State University, Columbus, Ohio.

At the inauguration of Anna Jane McKeag, Ph.D., as president of Wilson College, Chambersburg, Pa., on May 1, 1912, by Grace F. Pennypacker, vice-president of the Home and School League, Philadelphia, Pa.

At the meeting of the American Library Association at Ottawa, Canada, June 27 to July 2, by President George E. Vincent, of the University of Minnesota, Minneapolis.

DETERMINATION OF THE PLACE OF MEETING

At San Francisco, the directors present, on the showing made to them previously and at the time of their meeting, indicated their preference for St. Paul as the next place of meeting for the Association by a vote of thirty-one for that city to ten for Chicago. The matter was then, in accordance with custom, referred to the Executive Committee, with power to act, and to decide upon such location as in their judgment would best serve the interests of the Association. The Executive Committee, assuming that the necessary and customary conditions would be met at St. Paul, as the directors had been assured would be the case, visited St. Paul, inspected the facilities and conveniences offered, and decided to hold the meeting for 1912 in that city, provided the conditions which had been promised were met. St. Paul, however, at once began to experience difficulty in fulfilling these conditions. The railways refused to announce the customary rates, tho the St. Paul committee explained that they had private assurances that the rates would soon be authorized. To assist the St. Paul committee, members of the Executive Committee and the Secretary made repeated visits to Chicago and to St. Paul to confer with various railway authorities and if possible secure the announcement or assurances of the expected rates for St. Paul. All these efforts were futile, however, and by the time of the meeting of the Department of Superintendence at St. Louis in February, the Executive Committee, having definite assurance that no rates such as had been customary for the National Education Association could be expected in Western and Central Passenger Association territory, notified the St. Paul committee that they considered the question of location for the meeting an open one, subject to such determination as the interests of the Association might require.

When the failure to get rates had become practically certain, the President sent to all the directors representing the various states and territories a letter stating the facts as they had developed, and asking for their unofficial expression of opinion. Replies were received from thirty-two of the forty-eight State Directors (not counting Porto Rico, Hawaii, and the Philippines) by the time when it became necessary for the Executive Committee to make a decision. Of these replies thirteen, including that of the director from Illinois, favored St. Paul; eleven expressed a preference for Chicago; eight stated that as between Chicago and St. Paul they had no choice and thought the Executive Committee, which had fuller information than any single director, should decide as the members thought best. Sixteen directors had made no reply. It is probably fair to assume that these sixteen shared the sentiment of the eight who thought the decision should be made by the Executive Committee.

The committee considered the situation carefully; they investigated conditions in Chicago and ascertained the facilities offered there. The Chicago proffer had received little consideration up to that time, the committee having given its attention chiefly to St. Paul, assuming that conditions would finally be met, and the meeting held in that city.

After thus weighing the matter, a majority of the members of the committee decided that it would be wiser to hold the meeting for 1912 in Chicago; and the Association is now assembling in this city.

The local facilities offered the Association in Chicago were equal, at least, to those offered elsewhere; Chicago is less convenient for only a small proportion of the membership, most directly tributary to St. Paul; a meeting in St. Paul would have required three-fourths of the members to pass thru Chicago, the extra journey from Chicago to St. Paul and return, at the rates prevailing for railway and sleeping-car fare, requiring an extra outlay of about $20 for each of these members. Under the new and trying conditions to be met this year, your committee felt that a central location, as near as possible to the great body of the membership, was highly important.

The Executive Committee was subjected to some severe strictures from persons not familiar with all the facts. It was even stated that never before had an Executive Committee set up its own judgment in such a manner. Persons making such statements should have read history. By so doing they might have found that in 1892 the Executive Committee located the meeting of the Association in Saratoga Springs, N.Y., altho the previous year the directors had expressed a strong preference for Helena, Mont., as the place of meeting.

In 1894 the meeting was held at Asbury Park, altho at the last preceding meeting, in 1892, Asbury Park was not considered, but invitations were received from Milwaukee, Seattle, and Salt Lake City.

In 1896 the Executive Committee located the meeting in Buffalo, altho at the previous meeting in Denver, Los Angeles had been the city indicated as first choice by the directors.

In 1898 the Executive Committee located the meeting in Washington, D.C., altho at the preceding meeting the directors had expressed their preference for Omaha.

In 1907 the Executive Committee after extended negotiations with Philadelphia, located the meeting at Los Angeles, altho at the preceding meeting in 1905, Portland, Ore., Denver, and Salt Lake City, as well as San Francisco, had been among the places anxious to entertain the convention.

In 1910 the Executive Committee located the meeting in Boston, altho at the preceding meeting in Denver the directors had expressed their preference for San Francisco, voting twenty-one for San Francisco, ten for Milwaukee, and four for Boston.

EXAMINATION OF THE FINANCIAL RECORDS OF THE ASSOCIATION

Something over a year ago some newspaper reports concerning the possible condition of National Education Association funds or concerning a lack of knowledge of the condition of those funds, caused some little comment among those interested in Association affairs. No great notice was taken of these and no particular importance attached to them, however, by most of the people who saw them, and probably the matter would very soon have been forgotten had not an official of the Association taken pains to have facsimiles of some of these articles prepared and distributed widely thruout the country. This action was followed by considerable more discussion, and further comment from an increased number of persons. It was suggested that the Trustees at that time cause an examination of the securities and other financial records of the Association to be made, but nothing of the sort was done.

At the San Francisco meeting of the Board of Directors for the year 1910–11, the Treasurer serving for that year presented an elaborate report of some investigations which he had made, as he explained to the directors, for the purpose of satisfying his own curiosity. Unfortunately, this report was not made as the result of any authorization by officials of the Association and was not complete, since it did not include an examination of vouchers or a comparison of the same with the records. It was merely a carefully prepared document containing much interesting information gathered from various records of the Association; it was not in any way conclusive or final. It did, however, serve to raise the entire question of the records and funds of the Association anew and to indicate that, in the minds of some persons, at least, some inquiry or investigation was advisable.

During the autumn of 1911, after the meeting in San Francisco, the chairman of the Board of Trustees and one other member of that board, by arrangement between themselves, visited the vaults in which the securities representing the Permanent Fund of the Association are kept, and were accorded the privilege of examining those securities. They afterward published a statement saying that "in accordance with arrangement" they had examined the securities and found them to be as represented. It is unfortunate

that this examination also was made without notice to the other members of the Board of Trustees and without their knowledge, and that, altho the form of the statement made, no doubt, led many who read it to understand that the "arrangement" referred to was made by the Board of Trustees, the examination was not in anywise official or one which could be recognized by the Board of Trustees. Under these circumstances it seemed, both to members of the Board of Trustees and to members of the Executive Committee, that a complete examination of the records and accounts, vouchers, and other papers of the Association should be made, in order that any uncertainty which might exist in the minds of any of the members of the Association or in the minds of any other persons, might be set at rest, and any further talk or speculation concerning the same might be rendered unnecessary.

In accordance with this view, the President of the Association was authorized by the Board of Trustees to cause to be made such an examination of the accounts and papers of the Trustees, and by the Executive Committee to have such an examination made of the books of account and papers relating to the current funds of the Association since July, 1903, as might be thought advisable. In accordance with this authorization the President employed Marwick, Mitchell, Peat & Co., chartered accountants having offices in Chicago, Milwaukee, Minneapolis, and a number of the leading financial centers of the United States, also offices in various cities in Great Britain.

After the accountants, in accordance with authorization, had been employed to do this work and were preparing to begin the examination, letters were received from some of the officials concerned, either protesting against the examination or raising technical points with reference to it. These objections and technical matters were not thought of sufficient weight, however, to warrant abandoning or delaying the examination and the accountants began their work about the 20th of June. The President has received their report, which is transmitted to the Board of Directors herewith.

It gives the President pleasure to be able to inform the directors that the accountants report the accounts correct and state that in their judgment all receipts have been duly accounted for.

In accordance with the provisions of the Articles of Incorporation and By-Laws, the President, with the advice and consent of the Treasurer and the Secretary, designated Marwick, Mitchell, Peat & Co. to be the examiners of the securities constituting the Permanent Fund. They made the examination as requested and their certificate shows also that the funds reported by the custodian, in whose hands the funds have been for some years, are intact and in his possession.

The President desires, however, to call attention to two or three matters which seem to him to deserve attention. The accountants, in their report, recommend that some different method of handling and issuing the membership certificates and the funds received from memberships be devised. They suggest that the membership certificates be printed and supplied to the Secretary either by the Board of Trustees or by the Treasurer.

The Secretary, in accordance with the present custom, acts as collector both of memberships and of other funds of the Association. He himself has the membership certificates printed, he collects the money paid for memberships, and issues the membership certificates therefor. He accounts to the Treasurer for funds collected, as shown by the stubs in the membership receipt books. There is no suggestion that all membership books printed and used have not been accounted for; and yet had a dishonest official acted as collector in this manner during the years while the custom has prevailed, and, under the administration of such an officer a hundred or five hundred or a thousand of the stubs showing associate membership fees collected had been "lost," there would have been no way of knowing that this had been done. No one makes, or has any thought of making, any charge that any funds collected by the Secretary have failed to reach the coffers of the Association; if any such charge were made it would be impossible to substantiate it. On the other hand, under the system which has long been in vogue, it would be equally impossible for the official who has acted as collector in this way to show absolutely that no such thing had taken place or could take place. It is a matter of surprise that so serious a flaw as this should have been so long allowed to exist in the method by which the officials of the Association collect and account for the funds which pass thru their hands. I wish to emphasize the suggestion of the accountants, which is also the suggestion of the Treasurer, that the blank forms for use in the collection of membership fees and the issuance of membership certificates be printed under the direction of the Treasurer or under the direction of the Board of Trustees and that the same be issued to the Secretary for his use as collector for the Association. This suggestion is more in the interest of the Secretary, who is the collector for the Association, than in the interest of the Association, which appears to have been well and honestly served. In the words

of the accountants who have examined and reported upon the financial records of the Association, "By this means the Secretary would be relieved of responsibility upon being called upon to account for missing certificate books."

The President wishes also to suggest that somewhat more care be required in itemizing and auditing bills for expenses incurred on behalf of the Association. Many thousands of dollars are paid out of the Association's funds every year for the expenses incurred by various persons in doing the business of the Association. The expense accounts of some of these are rendered in minute detail accompanied by vouchers in all cases where possible. Other bills are presented very loosely itemized and in some cases entirely unaccompanied by any vouchers. Most institutions transacting business in anything like the volume transacted by the National Education Association require much greater care in the preparation and rendering of expense accounts. In certain matters the Association exercises great care. It has most minute directions for the correction of proof and a most carefully prepared "style sheet" is sent out to all those who read proof of matter which is to appear in the volume of *Proceedings*. If some sheet of instructions prepared with similar care could be supplied to persons who are authorized to incur expenses on behalf of the Association, it would be of advantage both to those who render bills, and to the Association. The form used in rendering bills to the Secretary is carefully prepared and itemized upon the outside as to the accounts into which the items of expense included in the bill shall fall. If a form prepared with equal care could be used on the inside to facilitate the proper itemization of accounts, the plan would commend itself.

During the year the President has made it a practice to file with his receipted bills for telegrams copies of the telegrams for which the Association is asked to pay. He has also asked the Secretary, as the other officer of the Association incurring the greatest expense for telegrams, to follow the same plan, and, since early in the autumn when the request was first made, the Secretary has cheerfully complied with the request. The national government requires that telegrams included in expense bills shall be thus furnished in duplicate. Many large corporations and business institutions follow the same plan. There seems no reason why the National Education Association should not adopt this method. An instance of the advisability of following this plan developed only recently: when the Secretary, in attempting to complete the file of copies of telegrams, sought to supply copies of some messages sent early in the year, he found himself unable to do so, either from his own files or from the files of the telegraph company, it proving impracticable to get, on request, the copies of telegrams amounting to several dollars, sent earlier in the year. Some of these telegrams were of such importance that the cost of transmission mounted into the dollars. Any method of records and accounting which does not retain copies of important messages of this character is less accurate and careful than it should be.

Respectfully submitted,
CARROLL G. PEARSE
President, National Education Association

Chicago, Ill., July 6, 1912

Carroll G. Pearse, Esq., President
National Education Association of the United States
Milwaukee, Wisconsin

DEAR SIR: In accordance with your instructions, we have made an examination of the books and records of the above Association for the period from July 1, 1903, to June 30, 1912, and now submit our report thereon, together with the following statements:

Exhibits

"A," receipts and disbursements for the nine years ended June 30, 1912.

"B," securities held for the Permanent Fund as at June 30, 1912.

Schedules for the nine years ended June 30, 1912

"1," revenue from Permanent Fund received by Board of Trustees and transferred to Treasurer.

"2," analysis of disbursements.

RECEIPTS AND DISBURSEMENTS

The receipts and disbursements for the nine years ended June 30, 1912, are detailed by years in Exhibit "A" supplemented by Schedules "1" and "2." A summary of the transactions of the Association during this period may be shown as follows:

Cash on hand July 1, 1903	$ 346.36
Receipts, July 1, 1903 to June 30, 1912	389,059.22
	$389,405.58
Disbursements July 1, 1903 to June 30, 1912	$299,872.85
	$ 89,532.73
Transfers to Permanent Fund	$ 84,150.00
Cash on hand June 30, 1912	$ 5,382.73

We conducted an exhaustive investigation of the receipts and are of opinion that all revenue has been properly recorded. Vouchers for disbursements were produced for our inspection and were in every case properly signed, approved, and authorized. We would point out that in accordance with the customary practice of the officials of the Association, the receipts each year, as recorded in Exhibit "A," include receipts to June 15 only, cash received during the period from June 15 to June 30 being carried forward to the next financial year. This practice was introduced to enable the report of the transactions for the year to be presented to the annual convention held early in July.

In connection with our audit of the accounts for the year ended June 30, 1912, we devoted special attention to the receipts from the San Francisco convention in July, 1911, and from the St. Louis meeting of the Department of Superintendence in February, 1912, and in our opinion all receipts were properly accounted for.

We suggest for your consideration the practicability of placing the issuance of certificate books in the hands of the Board of Trustees or the Treasurer and holding the Secretary responsible for all unused books. By this means the Secretary would be relieved of responsibility upon being called upon to account for missing certificate books. At the present time the Secretary orders such certificate books as are required, and unused books are not accounted for.

The books of the Association were well and carefully kept during the period covered by our investigation.

A statement of the permanent fund of the Association as at June 30, 1912, amounting to $190,000.00 is presented in Exhibit "B" which may be summarized as follows:

Security	Par Value	Book Value
Municipal and school bonds	$ 98,000.00	$ 98,940.00
Railroad bonds	86,000.00	82,162.50
Real estate		5,500.00
Cash on hand for investment		3,397.50
	$184,000.00	$190,000.00

The securities comprising the Permanent Fund as at June 30, 1912, deposited in the custody of the First Trust and Savings Bank were produced for our inspection and found to be in order.

The revenue from investments for the period from July 1, 1903, to June 30, 1912, was carefully checked with the Trustees' accounts and was found to be in agreement with the amount received by the Treasurer. A schedule of the interest received on investments is submitted in Schedule "1" and calls for no special comment.

In conclusion we desire to express our appreciation of the courtesies extended to our representatives while engaged on this examination.

Yours truly,

(*Signed*) Marwick, Mitchell, Peat & Co.
Chartered Accountants

DIRECTOR TAYLOR: There are some very important suggestions in your report, and I move that they be referred to the proper boards and committees, if you will designate them as you designated the recommendations in the report of the Treasurer.

PRESIDENT PEARSE: If the board wishes that they be referred by me, I will do so.

DIRECTOR COOK: Please state the motion.

PRESIDENT PEARSE: That the various items in the report made by the President be referred to the Executive Committee or the Trustees or to the incoming Board of Directors, as may be proper.

DIRECTOR SCRIBNER: I would amend Mr. Taylor's motion, that the report be referred to the Board of Trustees.

DIRECTOR TAYLOR: It is simply a question of proper reference with me. If that amendment would carry all of those recommendations to the proper place, I would be glad to accept it.

PRESIDENT PEARSE: The Chair has not had in mind to what authorities the recommendations of the report should go. There is no objection to having them go where the directors desire.

At this point there followed an extended discussion without definite action which continued until adjournment. This discussion is omitted from the record of the meeting in accordance with a motion adopted at the adjourned meeting of the Board of Directors, as follows:

Resolved, That all matter appertaining to the questions raised yesterday by the President in that section of his report entitled "Permanent Membership," and replied to by the Secretary today, and the following discussion—meaning all such matter now in print, in typewriting, or in stenographer's notes—be expunged from the records without impugning the motives or impeaching the character of any officer or member of the National Education Association—this resolution alone being published regarding the matter.

The meeting then adjourned to meet at 2:30 P.M., Tuesday, July 9.

IRWIN SHEPARD, *Secretary*

Approved,

CARROLL G. PEARSE, *President*

MINUTES OF ADJOURNED MEETING OF THE BOARD OF DIRECTORS

CHICAGO, ILL., TUESDAY, JULY 9, 1912

The meeting was called to order about 3:00 P.M. by President Carroll G. Pearse.

The roll-call was taken, resulting as follows:

Present: Directors Carroll G. Pearse, of Wisconsin; Katherine D. Blake, of New York; Irwin Shepard, of Minnesota; Thomas W. Bicknell, of Rhode Island; John W. Cook, of Illinois; Edwin G. Cooley, of Illinois; Oscar T. Corson, of Ohio; James M. Greenwood, of Missouri; Lorenzo D. Harvey, of Wisconsin; James Y. Joyner, of North Carolina; Charles I. Parker, of Illinois; Nathan C. Schaeffer, of Pennsylvania; A. R. Taylor, of Illinois; Ella Flagg Young, of Illinois; John H. Phillips, of Alabama; A. J. Matthews, of Arizona; George B. Cook, of Arkansas; James Ferguson, of California; James B. Ragan, of Colorado; Clem Hampton, of Florida; Grace M. Shepherd, of Idaho; William H. Campbell, of Illinois; Thomas A. Mott, of Indiana; O. P. Bostwick, of Iowa; John MacDonald, of Kansas; Robert J. Aley, of Maine; B. K. Purdum, of Maryland; Robert J. Fuller, of Massachusetts; E. E. Scribner, of Michigan; C. G. Schulz, of Minnesota; E. E. Bass, of Mississippi; John R. Kirk, of Missouri; Ward H. Nye, of Montana; G. W. A. Luckey, of Nebraska; W. J. Hunting, of Nevada; W. E. Garrison, of New Mexico; Grace C. Strachan, of New York; F. M. Harper, of North Carolina; George A. McFarland, of North Dakota; Edward M. Van Cleve, of Ohio; William F. Ramey, of Oklahoma; L. R. Alderman, of Oregon; Reed B. Teitrick, of Pennsylvania; D. B. Johnson, of South Carolina; J. J. Keyes, of Tennessee; George N. Child, of Utah; C. E. Beach, of Washington; Emma J. Gardner, of Wisconsin; Ira B. Fee, of Wyoming.

SECRETARY SHEPARD: Two of the states not represented yesterday, South Dakota and Connecticut, are represented today by letters of resignation from Director Ramer, of South Dakota, nominating Mr. C. G. Lawrence, who is present, and Mr. Verplanck, of Connecticut, who, as I reported yesterday, nominated Mr. Arthur D. Call, who did not reach here yesterday but who is present at this time.

PRESIDENT PEARSE: Directors, what is your pleasure? Shall the resignations of these two directors and the nominations be received and acted on at this time?

DIRECTOR E. E. SCRIBNER, of Michigan: I move that the resignations be received and the nominations approved.

The motion was duly seconded and carried.

C. G. Lawrence, of South Dakota, and Arthur D. Call, of Connecticut, reported as present and were duly seated. The total number of directors present was fifty-one.

PRESIDENT PEARSE: Is it your pleasure to take up and dispose of the matter which was under discussion at the time of adjournment, or shall the regular order of business, containing some three or four remaining items, be disposed of and then the other business taken up?

DIRECTOR J. M. GREENWOOD, of Missouri: I move that we take up the regular order of business not disposed of yesterday.

The motion was duly seconded and adopted.

DIRECTOR T. D. BICKNELL, of Rhode Island: I must leave before the meeting is over, and I wish to bring a matter before the Board of Directors. Two years ago at Boston a committee was appointed to organize an International Council of Education, and the committee has met today—a portion of the committee, made up of the ex-presidents of the Association and seven others. I would move that Mr. Carroll G. Pearse, the President of the Association, be made a member of this committee by reason of his holding the office of President of the Association.

PRESIDENT PEARSE: Will the director put his motion?

DIRECTOR BICKNELL: All those in favor of electing Mr. Carroll G. Pearse to membership in the Committee on International Council of Education will say Aye.

The motion was unanimously carried.

PRESIDENT PEARSE: The first order of business, as I understand the order, is the report of the Committee of the National Council on Investigations and Appropriations.

CHAIRMAN GREENWOOD: Mr. President, the Committee on Investigations and Appropriations, since adjournment in San Francisco, has had but one meeting and that was this forenoon and we are not prepared to bring in a report. We expect to report at the meeting of the new Board of Directors.

PRESIDENT PEARSE: You have heard the report that this committee has made. Is there any objection to allowing them additional time? If not, it is so allowed.

SECRETARY SHEPARD: We have a communication from Mr. Clark W. Hetherington, of the Athletic Research Society, asking that three representatives be appointed from each of five districts, the Eastern, Western, Southern, Rocky Mountain, and Pacific Coast districts, the three representatives preferably to be representatives of grammar schools, high schools, and normal schools, making in all fifteen men.

PRESIDENT PEARSE: The President, as well as the Secretary, has had communications with reference to the appointment of such a committee. It is desired on the part of the Athletic Research Society to have co-operative committees from educational organizations to study this question of athletics as related to education. It is desired that this Board of Directors authorize the appointment of a committee to consist of fifteen members to be chosen as indicated from different sections and representing different school interests, to co-operate in deliberative conferences with the other committees appointed by other organizations on request of the Athletic Research Society. What is your pleasure?

DIRECTOR E. E. BASS, of Mississippi: I move that the President be instructed to appoint such a committee.

PRESIDENT PEARSE: You have heard the motion that the President be instructed to appoint this committee.

DIRECTOR GREENWOOD: Does this involve an expenditure of money?

PRESIDENT PEARSE: Not unless later ordered by the directors. Are there further remarks?

The motion being duly seconded was put and carried.

SECRETARY SHEPARD: I have a communication from Dr. Thomas E. Storey, of the College of the City of New York, accompanied by a communication from the general secretary of the International Congress of Hygiene, to be held in this country. It is desired that there be an honorary vice-president appointed to sit in that convention as representative of the National Education Association. It is accompanied by a formal invitation and authorization for whomever shall be appointed.

PRESIDENT PEARSE: Directors, you have heard the request. What is your pleasure?

DIRECTOR GREENWOOD: I move that the President of the Association appoint an honorary member to sit in that body.

The motion was duly seconded and carried.

SECRETARY SHEPARD: I have a communication from W. S. McKinney, of Chicago, regarding expenses authorized at San Francisco. I think this communication comes under one of the divisions of the subjects referred to the Committee on Investigations and Appropriations.

PRESIDENT PEARSE: Lay it aside.

SECRETARY SHEPARD: I have a communication from President Joseph Swain, chairman of the Committee on Salaries authorized a year ago, with an appropriation of $3,000. The committee find it embarrassing to pay, as they deem it essential to pay, bills in advance of their payment by the Association, and they ask, if it is practicable, for a fund

of $200 or more to be available for the committee to draw upon as a revolving fund for current expenses, to be then rendered each month and covered by ordinary vouchers. It is the rule of the Association to pay bills but once each month, and the embarrassment has come from that monthly delay. It is an unusual request; it is not pressed. The committee simply ask for it, if it is practicable. If practicable, it would be very helpful to them.

PRESIDENT PEARSE: You have heard the request. What is your pleasure?

DIRECTOR J. W. COOK, of Illinois: I move that such an arrangement be made, under the control of the proper authority of the Association. Would that be the Committee of the National Council on Investigations and Appropriations, the Executive Committee, or the Board of Trustees?

PRESIDENT PEARSE: I presume it would be by the regular authorization of this body. Probably the proper motion would be for an appropriation of $200 or whatever sum is thought proper, to be made and placed in the hands of Chairman Swain of the committee, the voucher to be audited in the regular way and full details to be rendered by him in the form of itemized vouchers later.

DIRECTOR COOK: I will make that a part of my motion.

PRESIDENT PEARSE: Moved that the request of the committee be granted.

DIRECTOR GREENWOOD: Chairman Swain wished the directors to authorize this and asked the Committee on Investigations and Appropriations to make the recommendation. I hope it will be voted that such a sum, not to exceed $200, be authorized as a revolving fund, and that Chairman Swain's request go to the Committee on Appropriations with the indorsement of the directors.

PRESIDENT PEARSE: The money from which this appropriation would come has already been appropriated, both at the request of the general Association and by the Board of Directors at San Francisco. This is merely an authorization that a sum not to exceed $200 out of this money already appropriated by the Board of Directors be set aside for the use of President Swain and his committee. Would it be necessary for this to go thru the Committee on Investigations and Appropriations of the Council, which recommends that appropriations be made? It seems to the Chair that it would hardly be necessary. There is no objection to having it so referred, but it occurs to me that the appropriation having been already made, it will be sufficient for the Board of Directors to authorize the arrangement. You have heard the motion that the request be granted in terms as indicated. Are there any remarks?

The motion having been duly seconded was carried

SECRETARY SHEPARD: I have an application from Clarence D. Kingsley, of the Bureau of Education at Washington, D.C., for an additional appropriation of $1,200 for the expenses of the Committee on the Articulation of High School and College. I suspect that the same application has been made to the chairman of the Committee on Investigations and Appropriations of the Council.

PRESIDENT PEARSE: If there is no objection, this will be referred to the Committee on Investigations and Appropriations. It is so referred.

SECRETARY SHEPARD: I have a communication from the President of the Library Department requesting an appropriation to print a report that is now in preparation amounting to about twenty-five or thirty pages, supplementary to the report of Miss Baldwin, printed some years ago, upon "Courses of Instruction in Library Economy in Normal Schools." Much has been done and it is thought that they have a valuable report, but no funds are available to print it for circulation unless authorized by the Board of Directors.

PRESIDENT PEARSE: That should be referred to the Committee on Investigations and Appropriations the same as the last request.

SECRETARY SHEPARD: I have another communication from John Calvin Hanna, president of the Secondary Department, asking that the action of the Secondary Depart-

ment a year ago be approved by the Board of Directors. The Secondary Department confirmed the action of the individual round tables in calling themselves, or rather in adopting the name of, sections of the Secondary Department holding round tables. They want to be termed sections, not round tables, and Mr. Hanna says that he desires that the directors authorize the change in the name of these round tables to sections of the Department of Secondary Education.

PRESIDENT PEARSE: You have heard the request. What is your pleasure?

DIRECTOR SCRIBNER: I move that the request be granted.

The motion was seconded.

PRESIDENT PEARSE: It has been moved and seconded that the request of the Department of Secondary Education, that the subdivisions of that department be called hereafter sections instead of round tables, be granted.

DIRECTOP J. R. KIRK, of Missouri: I rise to a point of order, as to whether there is any constitutional provision for such action.

PRESIDENT PEARSE: The Chair will say that as far as he knows there is none. These members of the Department of Secondary Education may call their divisional meetings sections if they choose to do so. Am I correct about that?

DIRECTOR KIRK: That might cause confusion as to the use of the term sections and round tables.

PRESIDENT PEARSE: Of course there are no sections in this Association. This Association has general meetings and it has meetings of departments. There are no regularly organized sections. I don't know that it would make any difference except that the Department of Secondary Education, as it is explained to me, has a somewhat more regular custom of dividing for the discussion of topics in its curriculum.

The motion was duly carried.

SECRETARY SHEPARD: There is a very important question that I trust you will permit me to present now, with reference to the admission to the business meeting of active members in the Auditorium Theater tomorrow. Assuming that the ruling of last year stands, and that admission will be upon membership certificate, preparations to that end have been made, but it is quite essential that there be a committee on credentials. Some people leave their membership certificates at home, mislay them, or something of that kind, and we have found a committee on credentials very valuable and quite effective in preventing any friction or annoyance or delays. It is desirable that such a committee be appointed at the present time.

PRESIDENT PEARSE: The Chair rules that such a committee may be authorized at this time. If the directors should not think it worth while to authorize the appointment, I should appoint such a committee anyway, but I should be glad to be authorized.

DIRECTOR D. B. JOHNSON, of South Carolina: I move that the President be authorized to appoint such a committee, to consist of five members.

The motion was duly seconded and carried.

PRESIDENT PEARSE: The next item upon the Secretary's docket is unfinished business. Is it your wish to take up the unfinished business first, or the new business?

A DIRECTOR: I move that we take up the new business.

PRESIDENT PEARSE: If there is no objection, this will be done. What is the new business? Is there any new business?

SECRETARY SHEPARD: There is nothing docketed.

PRESIDENT PEARSE: Has any director any new business to present? If not, we come to the order of unfinished business. What is your pleasure?

DIRECTOR KIRK: I move that we proceed with the business in hand yesterday.

PRESIDENT PEARSE: Unless there is objection this will be done. In what manner will you proceed?

DIRECTOR W. J. HUNTING, of Nevada: I would like to ask what is the status of the business at the time of adjournment yesterday?

DIRECTOR J. Y. JOYNER, of North Carolina: We know what we adjourned for and I move we hear from it now. It was to give the Secretary time to present any report or statement he might wish to present in reply to the President. That is the unfinished business.

PRESIDENT PEARSE: The suggestion by Director Joyner is that the Secretary at this time be allowed to present any statement. If there is no objection, this will be the course of procedure.

At this point the Secretary presented a communication in answer to that part of the President's report presented the day before designated as "Permanent Membership."

After extended discussion, the following resolution was offered by Director Kirk, of Missouri, and carried:

Resolved, That all matter appertaining to the questions raised yesterday by the President in that section of his report entitled "Permanent Membership," and replied to by the Secretary today, and the following discussion—meaning all such matter now in print, in typewriting, or in stenographer's notes—be expunged from the records without impugning the motives or impeaching the character of any officer or member of the National Education Association—this resolution alone being published regarding the matter.

DIRECTOR R. B. TEITRICK, of Pennsylvania: I have a resolution which I would like to introduce before this body. In order that each state may foster a spirit of loyalty in bringing members to this Association, and that this may be apparent to those who have it in charge, I desire to offer the following resolution:

WHEREAS, Section eight (8) of the Act of Incorporation of the National Education Association of the United States provides that the meetings of the corporation may be held and that its business may be transacted as may be determined by the Board of Directors, therefore be it

Resolved, That in the annual meetings of the active members the members shall be seated by states, and whenever it shall be necessary to take a count, vote, or a vote by ballot, the vote shall be taken by each state director, or in his absence by a member appointed by the President, polling the members of his own state and announcing the result on a call of states.

PRESIDENT PEARSE: You have heard the resolution. The Chair would say that presented at this late hour it would embody some difficulties in the carrying-out of the plan for the present year. It might be referred to the active members for their approval.

DIRECTOR TEITRICK: I would like to ask Secretary Shepard if it is possible to carry it out this year.

SECRETARY SHEPARD: In two hours we arranged for twenty-four states to meet by states in the Auditorium Theater. There is now more time than that before the meeting of active members. It can be carried out. We can assign the places of states and we can furnish to every state director a list of members. We can carry it out if it is desirable.

DIRECTOR TEITRICK: I move its adoption for the present year.

PRESIDENT PEARSE: You have heard the motion and the second.

DIRECTOR JOHN MACDONALD, of Kansas: I don't think we can pass on that without discussion. It will be impossible for the directors to get their people together between now and then. I don't see that it is practicable. I think we should postpone this for consideration later.

DIRECTOR SCRIBNER: It seems to me a very simple matter. When a delegate appears at the door he can be assigned to his seat. It would facilitate matters, and each state will know how many representatives they have. They can hold their meetings there in the future.

DIRECTOR C. E. BEACH, of Washington: Inasmuch as it is difficult for me, and I presume equally difficult for other directors, to notify all those members from the state of Washington that this will be the method of voting tomorrow morning, I would like to move an amendment that this resolution become operative in the meeting of 1913.

The amendment was seconded.

DIRECTOR KIRK: I have not much interest in the matter myself, but it seems to me that if the usual Sunday-school convention plan be adopted, having banners for each section, our people can find their seats very easily. Ushers could point out the various banners, if that be necessary. I think it is easy.

PRESIDENT PEARSE: The Chair has heard a motion and a second, also an amendment to the effect that the plan be made effective for the meeting to be held in 1913.

DIRECTOR R. J. FULLER, of Massachusetts: I hope that the second motion will prevail. I believe that these matters should be given sufficient notice in this organization so that there can arise no misunderstanding in connection therewith.

DIRECTOR TEITRICK: I withdraw the whole matter.

PRESIDENT PEARSE: The motion is withdrawn, with the consent of the directors. Director Cook desires to offer a resolution.

DIRECTOR COOK: I wish to offer this resolution. I am not sure that the arrangement of the time is right.

Resolved, That it is the sense of the Board of Directors that there should be such modification of the Constitution and By-Laws as to require at least one year of active membership as a prerequisite for voting for officers of the Association.

In order to bring this resolution before the Board of Directors, I move its adoption.

PRESIDENT PEARSE: Are there remarks? The Chair is in doubt as to the effect of such a resolution.

DIRECTOR COOK: I ask for a roll-call on this motion. It is not binding for any future action.

PRESIDENT PEARSE: Merely an expression of opinion. The motion for the adoption of the resolution was seconded. Are there remarks?

The roll was called, resulting as follows: Ayes, 18; noes, 23.

Director Strachan, of New York, explained her vote as follows:

I think there should be some restriction. For instance, if the National Education Association should come to New York, we have an association with 14,000 members in it, and you see how easy it might be for the members of that city to control the business and policy of the Association at that time, and I think it would be pitiful for the National Education Association to be in any such danger.

But this seems to me to be useless just at this time, and furthermore, the order of business was called, and when the question of new business was raised, no resolution was offered. The last business of the afternoon was the unfinished business left over from yesterday. We were not expecting any new business, I think this is out of order. I therefore vote no.

PRESIDENT PEARSE: Is there any further business?

The meeting then adjourned.

IRWIN SHEPARD, *Secretary*

Approved,

CARROLL G. PEARSE, *President*

MINUTES OF THE MEETING OF THE NEW BOARD OF DIRECTORS FOR 1912–13

CHICAGO, ILL., THURSDAY, JULY 11, 1912

The meeting was called to order by President Fairchild at 4:30 P.M.

The roll was called, resulting as follows:

Present: Directors Edward T. Fairchild, of Kansas; Grace M. Shepherd, of Idaho; Irwin Shepard, of Minnesota; John W. Cook, of Illinois; James M. Greenwood, of Missouri; James Y. Joyner, of North Carolina; Charles I. Parker, of Illinois; Carroll G. Pearse, of Wisconsin; Nathan C. Schaeffer, of Pennsylvania; A. R. Taylor, of Illinois; John H. Phillips, of Alabama; A. J. Matthews, of Arizona; George B. Cook, of Arkansas; Archibald J. Cloud, of California; James B. Ragan, of Colorado; Arthur D. Call, of Connecticut; William M. Davidson, of the District of Columbia; Clem Hampton, of Florida; Aubrey Matthews, of Georgia; Walter R. Siders, of Idaho; William H. Campbell, of Illinois; Thomas A. Mott, of Indiana; O. P. Bostwick, of Iowa; John MacDonald, of Kansas; J. G. Crabbe, of Kentucky; Thomas H. Harris, of Louisiana; Robert J. Aley, of Maine; Charles J. Koch, of Maryland; Robert J. Fuller, of Massachusetts; E. E. Scribner, of Michigan; Julia H. Vaughan, of Minnesota; E. E. Bass, of Mississippi; William P. Evans, of Missouri; Ward H. Nye, of Montana; James E. Delzell, of Nebraska; F. M. Harper, of North Carolina; George A. McFarland, of North Dakota; J. T. Smith, of Ohio; Reed B. Teitrick, of Pennsylvania; C. G. Lawrence, of South Dakota; J. J. Keyes, of Tennessee; George N. Child, of Utah; Guy Potter Benton, of Vermont; C. E. Beach, of Washington; L. P. Benezet, of Wisconsin; Ernest E. Shuck, of Wyoming.

Number of directors present, forty-six.

PRESIDENT FAIRCHILD: Before the regular order of business I wish to present a matter that seems to be of considerable importance—one that the directors may well consider at this time in regard to one of the amendments to the By-Laws, which I am informed was adopted at the meeting yesterday. I shall read the part to which I desire to call your especial attention.

The first regular meeting of the new Board of Directors shall be held as soon as practicable and within twenty-four hours after the close of the last session of the annual meeting, the place and time of the meeting to be announced in the printed program.

The Chair has given considerable thought and has sought such advice as was available as to the meaning and application of this amendment. If the amendment, which I understand was passed yesterday, went into effect at once, then this meeting is not in order until after the gavel has sounded for the last time at the meeting Friday evening. The directors must then, within twenty-four hours, come together. Now these amendments nowhere suggest the time or circumstances under which they are to go into effect. There is no clause, so far as I have been able to discover, that says that they are to take effect on and after their passage. The statement which says (if I may repeat), "within twenty-four hours after the close of the last session, the place and time of the meeting to be announced in the printed program," would seem, inferentially at least, to suggest that it was not expected that this amendment should take effect upon its passage. A study of the wording of this particular sentence which I have read seems to reveal a considerable lack of clarity. The more I have studied this particular phrase the less sure I am as to the exact meaning. However, I would suggest that there is ground for the assumption that it is intended that this amendment should take effect next year, rather than at the present time. On the other hand, there are statements that warrant a conclusion that it is to go into effect at once. Upon the whole it seems to me that it would be wise for us to proceed under the old order of things. If any question arises

as to the legality of such action, a meeting of the directors may be called at the close of the final session Friday evening, at which time the proceedings of this afternoon might be ratified.

I desire also to call your attention to this proposition: it is possible that it is not the intention of the makers of this amendment to place the meeting of the directors beyond the time of the Association meeting. If the obvious interpretation is to apply, it seems that in the future no directors' meeting shall be held until the close of the regular session. Such an interpretation, however, of the amendment would surely work harm in that the sessions could not possibly represent the full deliberation so necessary to secure best results. Coming, if it did, at the close, but few directors would remain and the meeting would necessarily be greatly hurried. If the President of this Association would so rule, it might be wise to reopen this question at the general meeting in order that the statement might be clarified and so worded that the members of the directorate may understand it. I should be pleased to hear from anyone on this subject.

DIRECTOR E. E. SCRIBNER, of Michigan: My understanding (I was present at the time that article was read) was that the Board of Directors, the new board, were to meet within twenty-four hours after the close of the business session. What is the wording there?

PRESIDENT FAIRCHILD: Twenty-four hours after the close of the last session of the annual meeting.

DIRECTOR SCRIBNER: Are you sure that was the exact way it was passed?

DIRECTOR C. G. PEARSE, of Wisconsin: There has always been some question as to the time when the term of office of the old directors, the old President, old members of the Trustees, and so on, expired. The Articles of Incorporation provide that they shall serve until the close of the meeting following their election. That would make the term of the Board of Directors expire at the close of this meeting on Friday night, and would make the term of the President end Friday night. That has always been the recognized usage as to the President. The same usage should probably prevail as to the Board of Directors and the members of the Board of Trustees. Now, on this account there has always been a question about the legality of some acts; the question has never been pressed, but has been frequently discussed. In order to avoid that uncertainty, since the term continues until the end of the annual meeting subsequent to the election, it was thought best to allow the new Board of Directors to meet when there could be no question of the legality of the meeting or the right of the directors to their offices. While it has been customary to meet during the progress of the annual meeting, the right of officers to sit in those meetings has been questioned, and in case of a Trustee the right has been denied. As I understand it, in order to put at rest the possibility of question as to the right of the newly elected directors to sit and the newly elected President to preside and the newly organized Board of Directors to do business, the time set for the meeting of the new Board of Directors is after the close of the annual meeting. This meeting of the directors deals with matters like the selection of a few officials, including some members of the National Council; it listens to invitations for the next place of meeting; it makes some appropriations. Probably all these things could be attended to after the close of the meeting. Sometimes the last session of the annual meeting comes in the afternoon; in that case the directors could meet shortly after, on the same day. In case of an evening meeting, they could meet on the following morning. In order to clear the matter away, I move that the suggestion of the Chair made in the remarks which we have heard be followed: that the directors now proceed to transact their business in regular form; and that when they adjourn, they adjourn to meet at the close of the meeting on Friday evening, on the stage, for the purpose of formal ratification.

PRESIDENT FAIRCHILD: Is there a second to that motion?

DIRECTOR J. W. COOK, of Illinois: I second that motion, and I suggest that this precipitates another difficulty. If that be true, the old board is the legal body.

DIRECTOR SCRIBNER: Is it not true that the courts interpret only the meeting of a directorate which transacts business as the annual meeting of the directorate of a corporation? The meetings of this body which are for the purpose of hearing papers read and discussing those papers do not in any way affect the business of this corporate body, and therefore it seems to me that courts would hold that twenty-four hours after the meeting of the business session, which may transact business, which appropriates money, and so forth, terminates the term of the directors elected for any one year.

DIRECTOR J. M. GREENWOOD, of Missouri: It seems to me the reasonable construction of this amendment to the By-Laws would be this: I know of no body, legislative or deliberative, in which, just as soon as an act is passed, unless there is an emergency, it goes immediately into effect. Now, here in this particular case there is the action of the general Association yesterday afternoon. That has not been printed or published in any form so that the members of the Board of Directors could get hold of it. Furthermore, I am quite sure that no court would hold it necessary for us to meet here this afternoon and transact the business that comes up before us, and then have a corporal's guard on Friday night or Saturday morning get up and ratify what we have done. I am clearly of the opinion that if this amendment means anything, it is to take effect at the next meeting, after this body has adjourned, and then it should be applied. If it means printed in the program, there is no printed program: and under the Articles of Incorporation, here is a board regularly elected to transact business. I think that any court would hold that this body is properly elected, properly constituted under the Act of Incorporation, and that it is prepared to transact all business and adjourn, and that next year when the program is printed then this notice of twenty-four hours after the general session would go into effect. We could make the announcement then. It is impossible for us to meet under that twenty-four hours' limitation, because it has already expired. We stopped at 3:40 yesterday afternoon and we have no right to turn the clock back, even in Chicago. I believe it is unnecessary for us to have any other meeting of the Board of Directors except this meeting, regularly constituted to transact business.

DIRECTOR SCRIBNER: May I ask Mr. Greenwood a question? What is your interpretation as to what constitutes the last general session of this body?

DIRECTOR GREENWOOD: Yesterday afternoon, the business session. These other sessions are educational sessions, except this meeting of the new Board of Directors now in session.

DIRECTOR SCRIBNER: How about next year?

DIRECTOR JOHN MACDONALD, of Kansas: You and I may be dead next year.

PRESIDENT FAIRCHILD: Just a moment, please, if you will bear with the Chair. This section has to do with the annual meeting of the Association and that it shall be held in July on a day determined, two sessions to be held daily, and then it speaks of the annual business meeting of the active members, held on the fourth day of the annual meeting at eleven o'clock A.M. Then it provides for a meeting of the Board of Directors and uses the term "session" again rather than "meeting." I still submit that the whole thing needs clarifying that we may know what it does mean, and I am still wondering whether it is not possible for us to reopen this question at a general meeting and thus simplify matters.

DIRECTOR SCRIBNER: Let us open it. Is a motion in order, Mr. President?

DIRECTOR MACDONALD: Simply a single sentence. The business meeting has adjourned and we cannot reopen it.

DIRECTOR PEARSE: It is entirely immaterial to me, as the maker of the motion, whether or not it is adopted. I am perfectly willing to withdraw it. I made the motion as in line with the suggestion of the Chair, believing then, as I still believe, that it would clear away any particular difficulties. With reference to the other matter suggested by the Chair, the President of the Association is of the opinion that it has met and trans-

acted business, and it would not be proper to deal with business which came up at that meeting.

DIRECTOR COOK: Mr. President, it must be that Director Greenwood's view of this case is correct. It is inconceivable, it seems to me, that any By-Laws should go into effect in the midst of a meeting arranged for and entered upon under former By-Laws. As I understand it, the business meeting is to be held on the fourth day, and under present conditions it is held on the third day. By the very limitation of time it would be impossible to hold the business meeting on the fourth day. There would be a portion of the session after the By-Laws were adopted which would be illegal; should they become instantaneously operative, that portion would be illegal and adjournment would be illegal. It cannot be that these By-Laws should go into operation in the midst of the meeting provided for under the former By-Laws.

DIRECTOR C. J. KOCH, of Maryland: I wish to explain my vote on this question. It seems to me that there cannot be any question about the legality of our present proceedings. We have before us two questions. The first is the legality of this meeting and the second is with reference to future conduct. It plainly states here (altho the whole article is not plain, since it indiscriminately uses "meeting" and "session") that the first regular meeting of the new Board of Directors shall be held as soon as practicable, and so forth. Now, that must necessarily be the program of the annual meeting just printed. I simply state that I wish to vote against this motion. I am glad the maker does not care. I do believe that for future conduct in this matter you should take steps to find out whether the annual meeting does mean the annual business meeting.

DIRECTOR PEARSE: Since it is evident that the motion, which was intended to facilitate, is not to have that effect, I desire, with the consent of the second, to withdraw it.

PRESIDENT FAIRCHILD: The Chair would like to observe that the directors may well take notice of those applications on which no recommendation was made by the appropriations committee. Are there further remarks?

The first order of business following the roll-call is the election of a trustee to succeed Trustee James Y. Joyner, whose term expires at this meeting.

DIRECTOR F. M. HARPER, of North Carolina: North Carolina would be highly honored if Mr. Joyner should be elected to succeed himself.

DIRECTOR T. A. MOTT, of Indiana: I second the nomination.

DIRECTOR KATHERINE D. BLAKE, of New York: I move that the nominations be closed.

DIRECTOR MACDONALD: I move that the Secretary be instructed to cast the ballot for Mr. Joyner.

The motion was duly seconded and carried and the ballot was cast by the Secretary as directed.

PRESIDENT FAIRCHILD: The next item is the election of a member of the Executive Committee to succeed John H. Phillips, of Alabama, whose term expires at this meeting.

DIRECTOR T. H. HARRIS, of Louisiana: I wish to nominate for this position Superintendent George B. Cook, of Arkansas. Mr. Cook is in every way worthy of this distinguished honor. Under his leadership the schools of Arkansas have forged forward at a marvelous rate. He is a regular attendant upon the meetings of this Association, and I trust that this body will see fit to elect Mr. Cook to this position.

DIRECTOR J. E. DELZELL, of Nebraska: I second the nomination.

The motion was put and carried.

PRESIDENT FAIRCHILD: The next in order is the selection of members of the National Council to succeed members whose term expires at this session, also to fill vacancies. The Chair suggests a motion to appoint a nominating committee to report as promptly as possible.

DIRECTOR SCRIBNER: I make a motion that the Chair appoint a nominating committee of five to retire and report as soon as possible.

DIRECTOR BLAKE: I would like to amend that motion that at least one member be a lady.

The Chair nominated the following committee: Director William M. Davidson, of the District of Columbia; Director Robert J. Aley, of Maine; Director Nathan C. Schaeffer, of Pennsylvania; Director Katherine D. Blake, of New York; Director Clem Hampton, of Florida.

PRESIDENT FAIRCHILD: The next in order is the report of the Committee on Investigations and Appropriations of the National Council.

To the Board of Directors of the National Education Association:

We, the Committee on Investigations and Appropriations of the National Council of Education, recommend that the following amounts, or such amount thereof as may be necessary, be appropriated for the following named committees:

Committee on Articulation of High School and College	$ 300.00
Committee on College-Entrance Requirements in English Department of Secondary Education	350.00
Committee on Rural Schools	2,500.00
Committee on Musical Terminology	25.00
Committee on Geometry Syllabus	300.00
Committee on Standards and Tests of School Efficiency	500.00
Committee on Health Needs of Children	500.00
Committee on Economy of Time	250.00
Committee on International Council of Education	200.00

The committee submits as worthy, but without recommendation, the request of Mr. C. R. Rounds, chairman of the Committee on Uniform Nomenclature in English Grammar, that he be reimbursed for certain expenditures made in behalf of his committee.

Your Committee on Investigations and Appropriations believes that the growing tendency in the Departments of the National Education Association to ask for appropriations, and at the same time appoint committees to work under this appropriation, is reprehensible. The department president should present the names recommended for such committee to the President of the National Education Association or the president of the Council, who should make such nominations tentatively, guided by the recommendations from the department officials.

Relative to the request of the Joint Committee on Grammatical Terminology composed of members of the National Education Association, the Modern Language Association, and the American Philological Association, your Committee on Investigations and Appropriations cannot see their way clear to recommend an appropriation for expenses of a committee not composed of members of the National Education Association, when such members have not been appointed by the President of the National Education Association. We therefore submit the request of the above-named committee for an appropriation to the Board of Directors without recommendation or prejudice.

Respectfully submitted,

J. M. GREENWOOD, *Chairman*
F. A. FITZPATRICK
L. D. HARVEY
J. H. PHILLIPS
E. T. FAIRCHILD

PRESIDENT FAIRCHILD: It has been moved and seconded that the report be adopted.

DIRECTOR R. J. FULLER, of Massachusetts: I wish to propose an amendment to the report as submitted. This is with reference to the appropriation to the Committee on Health of Children. This committee has available from the American Medical Association a sum equal to the sum to be appropriated by this body today. The American Medical Association has already appropriated for such purpose a sum not to exceed $1,600. In other words, the American Medical Association is willing to hand over to our committee, not a joint committee, the sum of $1,600 for their use, asking us to equal that appropriation or to nearly equal it. I understand from the secretary of this committee that the committee needs $1,500 to $2,000 actually for their purposes, that they do not wish to use any part of this appropriation for purposes of transportation or for expenses of the committee. It is rather for purposes of distributing the literature thruout

the country to the various communities which need it. The whole movement this year will be carried on in the interests of bettering schoolhouse conditions and the buildings connected therewith in all communities, large and small. I would therefore move that this part of the report be amended to read an appropriation of $1,000 instead of $500.

DIRECTOR DELZELL: I second the motion.

PRESIDENT FAIRCHILD: It has been moved and seconded that the part of the report recommending that $500 be granted to the Committee on Health of Children be amended to read $1,000. Are there remarks?

DIRECTOR SCRIBNER: I noticed in Director Fuller's remarks that he stated that the American Medical Association had appropriated a sum not to exceed $1,600, or a sum equal to the sum that this body would appropriate. Their appropriation reads, "not to exceed $1,600." If we desire to co-operate with the American Medical Association in this work, it seems to me that our motion ought to read, "a sum not to exceed $1,000," rather than "an appropriation of $1,000."

PRESIDENT FAIRCHILD: The preliminary clause, that such amounts, "or as much as may be necessary thereof," covers the suggestion made by Director Scribner, I think.

DIRECTOR GREENWOOD: I inquired as to what would be the probable amount of money that could be used for these appropriations during the incoming year with safety. We found that the Rural Committee ought to have at least $4,000, but we did not have the money to appropriate. Other important committees, some that asked for $1,200 received $300. Our income for the year, that is, beginning with July 1 and closing June 30, 1913, will probably amount to just about what it was this year. Last year the recommendations made by the Committee on Investigations and Appropriations amounted to $3,200, or so much thereof as might be necessary. There was an appropriation made by the general Association of $3,000 yesterday, as you remember, in the business meeting. With $2,500 for one of the most important committees, we have to act, as I look at it, in accordance with the income that we will receive, and while I would like, as chairman of the Committee on Investigations and Appropriations, to grant every request up to the fullest extent, there were two or three requests that we threw out entirely. We have tried to recommend to you on a safe business basis. I wish that we could have appropriated for this particular committee $1,600, the amount asked for, but, gentlemen and ladies, we did not see our way clear to make appropriations when we did not know where the money would come from.

Motion of Director Fuller was then put and lost.

DIRECTOR MACDONALD: I don't think we ought to adopt this report when five members of the committee were absent.

DIRECTOR R. B. TEITRICK, of Pennsylvania: I have a communication from the president of the Manual Training Section which I would like to read in this connection:

CHICAGO, ILL., July 10, 1912

To the Council, National Education Association:

GENTLEMEN: On behalf of the Manual Training Section of the National Education Association I desire to request that an appropriation of $60 be granted to the Committee on College-Entrance Requirements.

This is the only committee of this section for which we are asking an appropriation, and in fact this is the only special appropriation that this section is asking for either for last year or for the coming year.

The work of this committee has been most valuable and is regarded as most important by the entire section. It has already had a helpful influence in securing college-entrance credits for drawing, manual training, and household economics—the subjects in which this section is primarily interested—and, what is equally important, has helped in securing greater freedom in general in the whole matter of college-entrance requirements.

This will grant to the high schools of the country greater freedom in shaping their courses of study to fit the local needs of their pupils in the special requirements of their communities; and no other service that I know of can be of more profound importance to the members of the section that I represent.

I regard it, therefore, as of the utmost importance to the section that the work of

this committee be continued; and if it is to be continued it must, of course, have funds with which to pay its necessary expenses for postage, stationery, multigraphing, etc. The amount that we are asking for—$60—is a conservative estimate.

I trust, therefore, that this appropriation will be granted.

Respectfully submitted,

(*Signed*) C. B. CONNELLEY, *President,*
Manual Training and Art Section
National Education Association

I move an amendment to the report, that the amount asked for, $60, be given this department.

PRESIDENT FAIRCHILD: I would like to inquire what committee that is.

DIRECTOR TEITRICK: The Committee of the Department of Manual Training and Art on College-Entrance Requirements.

DIRECTOR GREENWOOD: I received the same communication this afternoon. I have no objection to the appropriation of $60, but I don't know what it is for or where it comes from.

PRESIDENT FAIRCHILD: The Chair would like to ask that that motion be withdrawn until we dispose of the other.

The motion is on the adoption of the recommendations of the Committee on Investigations and Appropriations.

The motion was put and carried.

PRESIDENT FAIRCHILD: I will call your attention to the matters that will come under your consideration in addition to that suggested by Mr. Teitrick. Mr. C. R. Rounds asks to be reimbursed for certain expenditures on behalf of the Committee on Uniform Nomenclature. Mr. Rounds seems to have done a great deal of work, and so far as we can learn, the only work that has been done in this committee for the present, and he has personally met all of the expenses, amounting to some $250. He is, like many of us, dependent entirely upon his salary, and while the committee feels that he ought to be reimbursed for the actual expenditures made, they did feel that the committee was not in a position to establish a precedent in the way of refunds, and would prefer that the directors take the matter up. That, together with the other suggestion, and then the one relative to the joint committee on grammatical terminology, in which, as I now recall, he asked for quite an amount of money, is to come to your attention.

DIRECTOR J. J. KEYES, of Tennessee: I would like to ask if the Committee on Nomenclature was regularly appointed by the Association.

PRESIDENT FAIRCHILD: I understand so. Chairman Greenwood will answer that, I think.

DIRECTOR GREENWOOD: Last year there was a communication from Mr. Rounds, stating that he was engaged in this work. It came to the Committee on Appropriations. He stated something about his expenditures and the matter was brought before the Board of Directors at San Francisco and was laid over for report at this time. We wanted a more specific statement, so we have an itemized statement in regard to what he had done, the expense, and the vast amount of correspondence. The committee at this time felt that Mr. Rounds ought to be refunded. He is working in connection with two other associations. While we did not feel like making a direct appropriation, we felt that it was only a matter of justice to Mr. Rounds that a refund of $250 be made, and some other additional appropriation made. I would move that Mr. Rounds be refunded the $250 which he has expended. I am quite sure he is doing very valuable work in connection with other members of the committee.

DIRECTOR PEARSE: If there is any information needed, I should be glad to give it. The committee of which Mr. Rounds is chairman was first appointed by the Department of Superintendence and afterward authorized by the Association. It is working in connection with a committee from the Modern Language Association and the American

Philological Association. His committee has been regularly authorized for one year and much valuable work has been done.

PRESIDENT FAIRCHILD: The Chair would state that the committee is very glad to get that information.

The motion is that Mr. Rounds be reimbursed to the amount of $250 for expenses already incurred.

The motion was put and carried.

PRESIDENT FAIRCHILD: The same committee also asks for $1,200.

DIRECTOR SCRIBNER: I believe it is unwise for us, except in very unusual cases, to appropriate money until the Committee on Investigations and Appropriations have had an opportunity to investigate and recommend. I move that this appropriation asked for be referred back to the committee to report next year.

Motion was put and carried.

DIRECTOR TEITRICK: I should like to move that the amount asked for by the Committee on College-Entrance Requirements of the Department of Manual Training and Art be granted.

Motion put and carried.

PRESIDENT FAIRCHILD: The next order of business is the report of the Committee on Nominations for the Council.

DIRECTOR W. M. DAVIDSON, of District of Columbia: Your Committee on Nominations for the National Council reports as follows:

TERMS TO EXPIRE IN 1918

Thomas A. Mott, of Richmond, Ind., to succeed himself.
John H. Phillips of Birminghan, Ala., to succeed himself.
Francis G. Blair, of Springfield, Ill., to succeed himself.
James H. Baker, of Boulder, Colo., to succeed himself.
Ellen C. Sabin, of Milwaukee, Wis., to succeed herself.
Charles S. Meek, of Boise, Idaho, to succeed himself.
E. E. Scribner, of Ishpeming, Mich., to succeed himself.
A. A. Murphree, of Gainesville, Fla., to succeed J. A. Smith of Deland, Fla., absent for two successive years.
Helen C. Putnam, of Providence, R.I., to succeed Walter E. Ranger, of Providence, R.I., absent for two successive years.
E. T. Fairchild, of Durham, N.H., to succeed himself.

TERMS TO EXPIRE IN 1913

A. J. Kinnaman, of Bowling Green, Ky., to succeed E. H. Mark, of Louisville, Ky., absent for two successive years.
J. L. Snyder, of Agricultural College, Mich., to succeed Thomas M. Balliet, of New York, N.Y., absent for two successive years.

TERM TO EXPIRE IN 1916

Estelle Carpenter, of San Francisco, Cal., to succeed Frank B. Cooper, of Seattle, Wash., absent for two successive years.

TERMS TO EXPIRE IN 1917

J. G. Crabbe of Richmond, Ky., to succeed W. H. Bartholomew, of Louisville, Ky., absent for two successive years.
Margaret E. Schallenberger of San José, Cal., to succeed Estelle Reel Meyer, of Washington, D.C., absent for two successive years.
William E. Wilson, of Ellensburg, Wash., to succeed Julius I. Foust, of Greensboro, N.C., absent for two successive years.

TO BE TRANSFERRED TO THE HONORARY LIST

J. A. Smith, of Deland, Fla.
Walter E. Ranger, of Providence, R.I.
E. H. Mark, of Louisville, Ky.
Thomas M. Balliet, of New York, N.Y.
W. H. Bartholomew, of Louisville, Ky.
Estelle R. Meyer, of Washington, D.C.
Julius I. Foust, of Greensboro, N.C.
Frank B. Cooper, of Seattle, Wash.

The report of the committee was on motion accepted and adopted.

PRESIDENT FAIRCHILD: The next business is the reception of invitations for the place of meeting of the next annual convention.

DIRECTOR GREENWOOD: I have a request from President Thompson, of the University of Ohio, for an appropriation for the expenses of the Committee on the National University.

DIRECTOR SCRIBNER: I move that this request be referred to the Committee on Investigations and Appropriations.

DIRECTOR PEARSE: Before the motion is put, I perhaps ought to say this: The Association at a meeting three or four years ago made an appropriation for the fostering of sentiment for and to help forward the movement for a national university. The appropriation was $500. Some conditions were attached, and later the money was not available, so no money has ever been used for this purpose. This Association has a committee on the promotion of a national university: its membership is in print. In the judgment of those gentlemen who were here, President James, of Illinois, and others, the time has come for us to do something besides talk. He urges that the appropriation, at least as much as was formerly made, but later was not available, be now made available by this Board of Directors for the use of this committee which has been appointed to forward the idea of a national university.

As a substitute for the motion offered by Director Scribner, I move that this body appropriate a sum not to exceed $500 to be available during the coming year.

DIRECTOR DAVIDSON: I was delegated by the chairman of the committee of four hundred on a national university to, if possible, say a word, if opportunity presented, in furtherance of the movement from the standpoint of the national association, soliciting co-operation with what they are attempting to do along the line of manufacturing sentiment. That committee has presented a bill, a very satisfactory bill, which will be introduced doubtless on Tuesday of this week and will be ready for circulation within a very short time. That will be a great organization in assisting the furthering of this national university sentiment. They are back of it, ready to join hands with the National Education Association and its members in seeing that a great university is established.

PRESIDENT FAIRCHILD: The motion is made and seconded that the original motion be amended so that $500 shall be granted.

DIRECTOR SCRIBNER: I withdraw my motion.

PRESIDENT FAIRCHILD: The motion is that $500 be made available. Are there any further remarks?

The motion was put and carried.

DIRECTOR PEARSE: I have a request from the Fifteenth International Congress on Hygiene and Demography that this Association or this Board of Directors authorize the President to appoint delegates to that meeting. It need not carry any expense to the Association, and doubtless persons living not far away would be glad to act as delegates and this organization would then be represented.

I move that the President be authorized to appoint a number of delegates, such as in his judgment may be proper, to represent this Association at the Fifteenth Congress,

The motion was put and carried.

Invitations for the Fifty-first Convention were then presented as follows:

By D. H. Christensen for Salt Lake City.

By J. A. Shawan for Columbus, Ohio.

Other invitations were as follows:

By Director Vaughan, of Minnesota, for St. Paul in 1914.

By Director Cloud, of California, for San Francisco in 1915. He presented the following:

The President and Directors of the Panama-Pacific Universal Exposition to be held in San Francisco, in 1915, have the honor to extend to the National Education Association a cordial invitation to hold its 1915 meeting in San Francisco.

This city has been selected by Congress with the approval of the President of the United States as the official site for celebrating the uniting of the waters of the Pacific and the Atlantic thru the Panama Canal, the greatest physical accomplishment achieved by man. The Exposition will not only attempt to show that which is most advanced in invention, most interesting in art, and of greatest scientific value, embracing all that is most important in the material progress of the world, but it will be the aim of the Directors to make this rank in intellectual interest above all previous expositions, to bring together so much of wisdom, so much of practical scientific thought and so much of broad grasp of the world's important problems that the progress of mankind shall be advanced a quarter of a century.

To assist in achieving this aim, we invite your presence in the city of San Francisco in the year 1915.

BENJ. I. WHEELER
President, University of California

DAVID STARR JORDAN
President, Leland Stanford Jr. University

RUDOLPH J. TAUSSIG
Chairman, Committee on Exploitation

JOHN BRISKEN WALKER
Director of Congresses

CHARLES C. MOORE
President

F. J. SKIFF
Director in Chief of Foreign and Domestic Participation

James Ferguson, of California, spoke in favor of San Francisco as the place of meeting in 1915.

Director Siders, of Idaho, and Director Greenwood, of Missouri, spoke in favor of Salt Lake City.

The Directors then passed, by a unanimous vote, a motion of preference for Salt Lake City, final arrangements to be left to the Executive Committee.

The meeting then adjourned.

Approved,

E. T. FAIRCHILD, *President* IRWIN SHEPARD, *Secretary*

MINUTES OF THE MEETINGS OF THE BOARD OF TRUSTEES OF THE NATIONAL EDUCATION ASSOCIATION IN CONNECTION WITH THE FIFTIETH ANNUAL CONVENTION IN CHICAGO, ILL.

PLANTERS HOTEL
ST. LOUIS, February 27, 1912

Pursuant to a call made by James M. Greenwood, chairman of the Board of Trustees of the National Education Association, the board met in Parlor E at 9:25 A.M.

Trustees Greenwood, Joyner, Pearse, and Aley were present. Trustee Brown was absent.

The secretary read the call of the meeting, which, under date of February 8, 1912, had been mailed to each trustee. This call was as follows:

J. M. Greenwood, chairman of the Board of Trustees of the National Education Association, has called a meeting at 10 A.M., February 27, at the desk of the Secretary of the National Education Association in the Planters Hotel, St. Louis, Mo. This meeting is to be held for the transaction of such business as may regularly come before the Board of Trustees.

The chairman of the board had received several requests for appropriations and also several inquiries as to the probability of future appropriations. By vote of the Trustees the chairman was instructed to inform those making requests or inquiries that the Trustees do not make appropriations.

The secretary made a preliminary report on his examination of the papers containing the records of the actions of the Trustees prior to July, 1896.

By vote of the Trustees the secretary was instructed to write a report upon these papers and records and submit to the Trustees at the annual meeting in July.

The secretary was also instructed, after he completes the examination, to send these papers and records to Secretary Irwin Shepard for safekeeping.

At 11:50 A.M. the Board of Trustees adjourned to meet at the same place at 2:00 P.M., February 28.

ROBERT J. ALEY, *Secretary*

J. M. GREENWOOD, *Chairman*

PLANTERS HOTEL
ST. LOUIS, February 28, 1912

Pursuant to the adjournment of the meeting of February 27, the Trustees met and were called to order at 2:30 P.M. by Chairman Greenwood.

Trustees Greenwood, Pearse, Joyner, Brown, and Aley were present at the meeting.

By vote of the Trustees, Chairman Greenwood was authorized to invest any funds that may become available either from the receipts of the Association or from the maturity of investments. Before making the investment, the chairman will communicate with the other trustees, by either letter or telegram, and secure their approval of the proposed investment.

The following resolution was introduced by Trustee Pearse, and was unanimously approved by the Board of Trustees:

That the President of the Association be authorized to secure the services of an expert, licensed accountant to go over the papers of the Trustees and their accounts and to report his findings thereon to the President, before the next meeting of the Association;

also to report any suggestions he thinks proper, relative to possible improvements in methods of transacting the business of the Association, or in the methods of accounting.

At 3:50 P.M. the Board of Trustees adjourned.

ROBERT J. ALEY, *Secretary*

JAMES M. GREENWOOD, *Chairman*

CHICAGO, ILL., July 8, 1912

Pursuant to a regular official call, the Board of Trustees of the National Education Association met at Secretary Shepard's desk, Ladies' Parlor, Auditorium Hotel, Chicago, Ill., at noon, July 8, 1912.

There were present Trustees Pearse, Greenwood, Joyner, Brown, and Aley.

Chairman Greenwood reported that he had a chance to sell the Chicago real estate belonging to the National Education Association for $3,500 in cash.

Upon motion of Trustee Brown, the chairman of the Board of Trustees was authorized by unanimous vote to make further investigation and if the offer proved to be a fair value for the property, to make the sale and to take proper measures to invest the proceeds in securities.

Upon motion of Trustee Joyner, the board gave unanimous approval of the secretary's minutes of business transacted by mail.

The annual report of the Board of Trustees was ordered to be spread upon the record.

The board adjourned to meet at the same place, Thursday, July 11, at 9:00 A.M.

ROBERT J. ALEY, *Secretary*

JAMES M. GREENWOOD, *Chairman*

BUSINESS TRANSACTED BY MAIL

Under date of May 15, 1912, the following order was issued to Mr. Louis Boisot, Trust Officer, Chicago, Ill.

KANSAS CITY, MO., May 15, 1912

Mr. Louis Boisot, Trust Officer,
Chicago, Ill.

DEAR SIR: You are hereby authorized to transfer to the First National Bank all revenues arising from the investment of the Permanent Fund of the National Education Association, and to deposit the same to the credit of the Treasurer of the National Education Association, on or before June 1, 1912.

Will you have the kindness to notify the Treasurer of the Association of your action, and also transmit the item of expense connected therewith to the Secretary, Dr. Irwin Shepard, that the bill may be included in the expense account of the current month.

Very truly yours,

(*Signed*) J M. GREENWOOD
Chairman of the Board of Trustees

INVESTMENT

Having been informed by the President of the National Education Association, and the members of the Executive Committee associated with him, that there was a fund of approximately ten thousand dollars ($10,000) awaiting investment, Chairman Greenwood asked the members of the Board of Trustees to authorize him to look up a good investment. This authorization was given by mail.

After some investigation, Mr. Greenwood recommended the purchase of $10,000 School District of Kansas City, Mo., 3½ per cent school bonds, dated July 1, 1905, and due July 1, 1925.

Chairman Greenwood having submitted this proposed purchase to the members of

the board and receiving from them by mail their favorable answer, the investment was made, as is shown by the attached receipt.

PROFESSOR J. M. GREENWOOD Kansas City, Mo.	H. P. WRIGHT INVESTMENT CO. Investment Securities 923 Baltimore Ave. Kansas City, Mo.
Bought:	June 12, 1912

$10,000 School District of Kansas City, Mo., 3½ per cent school bonds, dated July 1, 1905, due July 1, 1925, interest payable semiannually January first and July first, both principal and interest payable at the National Bank of Commerce. New York City, Nos. 3127, 3128, 3129, 3133, 3135, 3136, 3190, 3191, 3192, and 3200 for $1,000 each at 95 ..... $9,500.00
Accrued interest January 1 to June 12 (5 months, 11 days) 156.53

$9,656.53

Received payment.

CHAS. BEGGS, *Cashier*

KANSAS CITY, MO., June 14, 1912

President Robert J. Aley,
Orono, Me.

DEAR PRESIDENT ALEY: I have just received a note from Mr. Boisot in which he suggests that I put five hundred dollars ($500) instead of $343.77 into the Permanent Fund. In compliance with his suggestion, I will send him my personal check for $156.53, the amount of the accrued interest at the time of the purchase of the bonds and as noted in the memorandum that I sent to you yesterday. I will then ask the Association to refund the amount of the check to me. This, you will observe, will be the transference of $10,000 to the Permanent Fund. This correction will enable you to keep your book in proper form which would have introduced some confusion by deducting the item of interest as previously mentioned.

I am

Very truly yours,

(*Signed*) J. M. GREENWOOD
ROBERT J. ALEY, *Secretary*

JAMES M. GREENWOOD, *Chairman*

CHICAGO, ILL., July, 11, 1912

The Board of Trustees of the National Education Association met in the Ladies' Parlor of the Auditorium Hotel, Chicago, Ill., at 9:00 A.M. pursuant to the adjournment of July 8. The following report was presented:

THE BOARD OF TRUSTEES OF THE NATIONAL EDUCATION ASSOCIATION

Pursuant to an order passed by the Board of Trustees at the St. Louis meeting in February, 1912, I have examined the papers relating to the business of the National Education Association prior to August 1, 1896. These papers consist of letters, vouchers, bankbooks, account-books, and various matters relating to the financial transactions of the Association. I have gone thru them with care and have tied them in twelve packages. The contents of each package is noted in the accompanying report.

On April 9, 1912, the packages were shipped to Irwin Shepard, Winona, Minn., for permanent safekeeping. Each package was properly numbered and accompanying the shipment was a duplicate of the list, which is here submitted. If this report is made a part of the minutes of the Board of Trustees, no future examination of these papers will be necessary.

Respectfully submitted,
ROBERT J. ALEY
Secretary, Board of Trustees

PACKAGE NO. 1

This package contains the following:

a) Treasurer's account and book containing a written statement of the dates of the Treasurer's accounts from 1883 to June, 1896.

b) Board of Trustees Permanent Fund.

This book contains items relating to the Permanent Fund, beginning with 1878 and extending to December, 1895.

c) Cash book extending from July, 1903, to July, 1907.

PACKAGE NO. 11

This package contains the following:
a) A book giving lists of bonds and coupons owned by the National Education Association.

PACKAGE NO. 12

This package contains the following:
a) Three books of National Education Association order stubs.

April 9, 1912

THE BOARD OF TRUSTEES OF THE NATIONAL EDUCATION ASSOCIATION

Among the papers belonging to the Trustees of the National Education Association which I examined, I was able to find the following minutes of Trustees' meetings which, it seems to me, should be made part of the permanent record of this body.

Respectfully submitted,
ROBERT J. ALEY
Secretary, Board of Trustees

MINUTES, FIRST MEETING OF THE TRUSTEES OF THE NATIONAL EDUCATIONAL ASSOCIATION

The Trustees of the National Educational Association met on the 25th day of February, 1886, in the city of Washington, D.C.

Present: Norman A. Calkins, John Eaton, and Zalmon Richards.

The above-named Trustees proceeded to make a preliminary organization by choosing N. A. Calkins as chairman and Zalmon Richards as Secretary.

It was resolved to meet at Topeka, Kans., July 13, 1886, and to submit the matter and manner of perfecting the organization of the Association, under the corporate power, secured by instruction of the Board of Directors of the National Educational Association, at their meeting, held at Saratoga in 1885, to the meeting of the said directors at Topeka, Kans., in July, 1886, for approval and adoption.

Adjourned.

Z. RICHARDS, *Secretary*

(True copy)

Resolved, That the title by which this Association shall be known, shall be the "National Educational Association," and that this resolution for change of name be duly recorded so as to amend the Certification of Organization executed and recorded,

February 24, 1886—in Liber No. 4, folio 36 et seq.—Acts of Incorporation for the District of Columbia.

Resolved, That the chairman of this Board of Trustees is hereby declared to be the executive officer of the board, and he is duly empowered to act for and in behalf of said board in the transaction of its ordinary business during the intervals between the meeting of the Trustees.

Adjourned.

Z. RICHARDS, *Secretary*

(True copy)

The above resolution was readopted by the Board of Trustees, at their meeting held in Central Music Hall, Chicago, Ill., July 15, 1887.

MINUTES, MEETING OF THE TRUSTEES OF THE NATIONAL EDUCATIONAL ASSOCIATION

SARATOGA SPRINGS, July, 12, 1892

A meeting of the Board of Trustees was held, at Congress Hall, Saratoga Springs, July 12, 1892.

Present: H. S. Tarbell, N. A. Calkins, and Z. Richards.

The matter of providing a fund of the National Educational Association, from which sums of money may be designated for definite purposes, to be disbursed under the supervision of the Board of Trustees, was considered.

On motion of Trustee Tarbell it was

Voted, That the Board of Trustees recommend the establishment of an Emergency Fund—to be subject to expenditure by the Board of Trustees in accordance with vote of the Board of Directors at any regularly called meeting—the said fund may be used for the purpose of meeting deficiencies of income of the Association, and for such additional investigation and publications as may be determined by said Board of Directors.

Voted, That the Emergency Fund be constituted by transferring from the balance of receipts of the Association for any year, after all expenses and other liabilities for said year have been duly paid, such sum as may be deemed expedient by the Board of Trustees under the provisions of the Constitution, in Section 10, Article 4, provided that the total amount in said Emergency Fund shall not exceed in any year the sum of four thousand dollars.

CHICOPEE FALLS, MASS., July 14, 1894

DEAR MR. CALKINS:

Below is a copy of the record of our transaction yesterday, correct, as I believe.

Yours truly,

EDWIN C. HEWETT

The Trustees of the National Educational Association met at the West End Hotel in Asbury Park at 9:00 A.M., July 13, 1894.

Present: Calkins, Tarbell, Hewett.

N. A. Calkins was chosen chairman of the board.

Zalmon Richards was chosen clerk and curator, for which services his salary was fixed at fifty dollars per annum.

Edwin C. Hewett was appointed clerk, *pro tem.*

It was voted that Chairman Calkins be empowered to act for the board in all matters in which he may choose to take that responsibility.

Adjourned.

EDWIN C. HEWETT, *Clerk, pro tem*

Upon motion of Trustee Pearse, the report was accepted and ordered to be made a part of the official minutes of the Board of Trustees.

The board adjourned to meet at the same place Friday evening, July 12, immediately following the meeting of the Board of Directors.

ROBERT J. ALEY, *Secretary*

J. M. GREENWOOD, *Chairman*

CHICAGO, JULY 12, 1912

The Board of Trustees met pursuant to adjournment in the Ladies' Parlor of the Auditorium Hotel, Chicago, at 11:15 P.M.

There were present Trustees Greenwood, Brown, Joyner, Aley, and Fairchild.

The Board of Trustees immediately adjourned from the Ladies' Parlor to Room 346, Auditorium Hotel.

The Board was organized for the ensuing year by the unanimous election of the following officers:

James M. Greenwood, Kansas City, Mo., chairman, and Robert J. Aley, Orono, Me., secretary.

Chairman Greenwood reported that he had investigated the price offered for the Lake Avenue property and was convinced that the offer should be accepted.

By vote of the Board of Trustees, J. Stanley Brown was instructed to complete in proper legal manner the sale of the property at 4762 Lake Avenue, Chicago.

Dr. Irwin Shepard tendered his resignation as Secretary of the National Education Association. He requested that the same take effect July 31, 1912. The resignation was accepted to take effect when a successor is duly elected and qualified.

Upon motion of Trustee Aley, the Board of Trustees voted to make a special appeal to the Carnegie Foundation in behalf of Dr. Shepard.

The board adjourned to meet at the call of the officers, on or about August 24, 1912, at Columbus, Ohio.

ROBERT J. ALEY, *Secretary*

JAMES M. GREENWOOD, *Chairman*

CHICAGO, ILL., August 5, 1912

An official call for the meeting of the Board of Trustees of the National Education Association having been regularly made by Chairman James M. Greenwood, the board met in Room 128, Auditorium Hotel, Chicago, Monday forenoon, August 5, 1912. The change of the time and meeting-place from the adjournment vote of July 12 was due to the necessity of electing a Secretary earlier than had been anticipated.

There were present at the meeting Trustees James M. Greenwood, J. Stanley Brown, J. Y. Joyner, E. T. Fairchild, and Robert J. Aley.

The meeting was called for the purpose of electing a Secretary of the National Education Association to succeed Irwin Shepard, who gave his resignation to the board July 12, 1912.

By unanimous vote the Board of Trustees adopted the following resolution concerning the resignation of Dr. Irwin Shepard:

In accepting the resignation of Secretary Irwin Shepard, the Board of Trustees of the National Education Association express their high appreciation of the long, helpful, and conscientious service he has rendered the corporation.

In whatsoever work he may engage, he will carry with him the gratitude of his hosts of friends in every state of the American Union.

It is the earnest wish of this body that his future years may be as full of benefit to the educational world as have been his past.

By unanimous vote of the Board of Trustees, D. W. Springer was elected Secretary of the National Education Association for a term of four years with a salary schedule as follows: First year, $4,000; second year, $4,500; third and fourth years, $5,000.

After considerable discussion, the Board of Trustees by unanimous vote recommended to the Board of Directors that the office and residence of the Secretary of the National Education Association be at Indianapolis, Ind.

Trustees Fairchild and Aley were made a committee to arrange for the closing of the office at Winona, Minn., and the opening of the new office at Indianapolis.

Secretary Aley was instructed to notify Mr. Springer of his election. He did so by sending him the following letter:

CHICAGO, ILL., August 5, 1912

Prof. D. W. Springer,
Detroit, Mich.

MY DEAR MR. SPRINGER: At a meeting of the Board of Trustees of the National Education Association held in the Auditorium Hotel, Chicago, this day, you were unanimously elected Secretary of the Association to succeed Irwin Shepard, resigned. Your election is for a term of four years, with a salary schedule as follows:

First year, $4,000; second year, $4,500; third year, $5,000, and thereafter, $5,000.

It is expected that you will begin on your duties at once. You should go to Winona, Minn., at your earliest convenience, file your bond, and do whatever other details are necessary. Mr. Shepard is very anxious to be relieved at the earliest possible moment.

It was unanimously recommended by the board that the office and residence of the Secretary be established at Indianapolis, Ind. It will probably not be feasible to make this transfer for some time. President Fairchild and Secretary Aley were made a committee to arrange for the lease of offices and to take charge of the details of the transfer. This committee will correspond with you concerning the matter.

Please write me at my home address.

Very cordially yours,
ROBERT J. ALEY

Having completed the business for which the meeting was called, the board adjourned.

ROBERT J. ALEY, *Secretary*

J. M. GREENWOOD, *Chairman*

Necrology

From December 25, 1911, to December 31, 1912

JOURNAL OF PROCEEDINGS

OF THE

FIFTIETH ANNUAL MEETING

OF THE

NATIONAL EDUCATION ASSOCIATION OF THE UNITED STATES

CHICAGO, ILL., JULY 6–12, 1912

EDUCATIONAL SUNDAY

In accordance with an established custom, Sunday, July 7, was observed as Educational Sunday by a large number of the churches of Chicago, on which date the respective pastors held special services, preaching sermons on educational topics as follows. All services were held in the forenoon unless otherwise stated.

"Christian Teaching in the Public Schools"—Rev. William Otis Waters, Grace Church (Episcopal), Wabash avenue and 15th street.

"The Value of Brains"—Rev. James O. May, Park Avenue Methodist Episcopal Church, Park avenue and Robey street.

"Education: What Is It?"—Rev. A. H. W. Anderson, All Saints Church (Episcopal), Wilson avenue and North Hermitage avenue.

"Education Which Educates"—Rev. W. Hanson Pulsford, First Unitarian Society, Woodlawn avenue and 57th street.

"The Function of Education in a Democracy"—Rev. James S. Ainslie, D.D., North Shore Congregational Church, Sheridan road and Wilson avenue.

"Education for the Life Here and Hereafter"—Rev. E. J. E. Schreck, Sheridan Road Church of the New Jerusalem (Swedenborgian), 910 Sheridan road, near Rokeby street.

"Education and Religion"—Rev. Edwin J. Randall, St. Barnabas Church (Episcopal), 4237–41 Washington boulevard.

"Education as a Means of Grace"—Rev. William Carson Shaw, St. Peter's Episcopal Church, Belmont and Evanston avenues.

"Education, the Highway to Nobler Life"—Rev. John Bradford Pengelly, St. Edmund's Episcopal Church, 5831 Indiana avenue.

"The Liberating Power of Education"—Rev. Walter S. Pond, Holy Trinity Church (Episcopal), 4716 Union avenue.

"The Educational Value of Religion"—Rev. Edward Scribner Ames, Hyde Park Church of Disciples, 57th street and Lexington avenue.

"True Education, Its Object and Its End"—Rev. George M. Babcock, Calvary Episcopal Church, 3160–62 West Monroe street, near Kedzie avenue.

"How Can the Church and Public School Work Together in Moral Training?"—Rev. William Chalmers Covert, Forty-first Street Presbyterian Church, corner 41st street and Grand boulevard.

"The Final Aim of Education"—Rev. P. O. Bersell, Grace Evangelical Lutheran Church, 70th street and Union avenue.

"Education and Religion"—Rev. E. F. Williams, Wellington Avenue Congregational Church, Wellington avenue, near Evanston avenue.

"Some Standards in Education"—Rev. Walter C. Davis, Holy Trinity Church (English Lutheran), La Salle avenue and Elm street.

"In What Way Can Public Education Be Moral and Religious?"—Rev. Edward Harvey Curtis, Woodlawn Park Presbyterian Church, 64th street and Kimbark avenue.

"The Value of Education"—Rev. Henry Edward Rompel, Centenary Methodist Episcopal Church, West Monroe street, between Morgan and Aberdeen streets.

"The Higher Ministries of Education"—Rev. H. Irving Parrott, Windsor Park Congregational Church, Marquette avenue and 77th street.

"Christian Education"—Rev. H. W. Schniewind, Saint Bartholomew's American Catholic Church, Stewart avenue and North Normal parkway, Englewood.

"Christian Ideals of Education"—Rev. Frederick J. Bate, the Church of the Redeemer (Episcopal), Washington avenue and 56th street.

"The Relation of Education to Christianity"—Rev. Howard Adams Lepper, Trinity Reformed Episcopal Church of Englewood, 70th street and Yale avenue.

"Pragmatism in School and Church"—Rev. Martin J. Magor, McCabe Memorial Methodist Episcopal Church, Washington avenue and 54th street.

"Our Schools and Our Republic" (evening)—Rev. Olin Mason Caward, Normal Park Presbyterian Church, 71st street and Yale avenue.

"The Relation of the Church to the Cause of Education"—Rev. C. R. W. Kegley, Lutheran Church of the Epiphany, 2227 Ogden avenue, near Taylor street.

"Democracy and Education"—Rev. Oscar C. Helming, University Congregational Church, Madison avenue and 56th street.

"The Master Teacher"—Rev. O. F. Jordan, Evanston Christian Church (Disciples of Christ), Maple avenue and Greenleaf street.

"Education in Religion"—Rev. Vaughan Dabney, Douglas Park Church of Christ (Disciples), 19th street and Spaulding avenue.

"The Spiritual Element in Education"—Rev. Louis Rich, Humboldt Park Parish Church (Swedenborgian), California avenue and Le Moyne street.

"Knowledge of Life, the Supreme Knowledge of God"—Rev. LeRoy Moore, Unity Society of Chicago, 204 LeMoyne building, 27 East Randolph street.

"Education and Character"—Rev. William E. Barton, D.D., First Congregational Church of Oak Park, Lake street and Kenilworth avenue.

"The Three H's in Education"—Rev. A. Eugene Bartlett, Church of the Redeemer (Universalist), Robey street and Warren avenue.

"The City's Obligation to Childhood"—Rev. Myron E. Adams, First Baptist Church, South Park avenue and 31st street.

"Secular and Religious Education"—Rev. Annesley Thomas Young, Advent Church (Episcopal), Logan boulevard and North Francisco avenue.

"Christian Education"—Rev. Peter J. O'Callaghan, St. Mary's Church (Catholic), Wabash avenue and Eldridge place.

"Christian Education"—Professor Frank G. Ward, South Congregational Church, Drexel boulevard and 40th street.

"Education and the Moral Ideal"—Rev. Paul Jordan Smith, Chicago Lawn Congregational Church, 62d place and St. Louis avenue.

"Educational Ideals"—Rev. Preston Bradley, Church of Providence (Presbyterian), 3526 Sheffield avenue, near Clark street.

"Education and Social Service"—Rev. Ozora S. Davis, New First Congregational Church, Ashland and Washington boulevards.

"Education and National Progress"—Rev. E. LeRoy Dakin, Memorial Church of Christ (Baptist and Disciples), Oakwood boulevard near Cottage Grove avenue.

"Education in Worship"—Rev. Herbert W. Prince, St. Paul's Protestant Episcopal Church, Madison avenue and 50th street.

"The Moral Aspect of Education"—Rev. Theodore G. Soares, University of Chicago, Hyde Park Baptist Church, Woodlawn avenue and 56th street.

"The Church's Relation to Public Education"—The Very Rev. Walter Taylor Sumner, Cathedral SS. Peter and Paul (Episcopal), Washington boulevard and Peoria street.

"The Coming Race: The Esoteric and Psychic Value of Education"—Rev. Alexander J. McIvor-Tyndall, Advanced New Thought Church, Hall 901, Masonic Temple.

"Some Features of Education Frequently Overlooked"—Rev. Charles Herbert Young, Christ Church (Episcopal), 65th street and Woodlawn avenue.

"What Education Is Worth Most?"—Rev. Will F. Shaw, Church of Christ, Sheffield avenue and George street.

"The Church and the School"—Rev. John D. Hull, Metropolitan Church of Christ, Van Buren and Leavitt streets.

"The American Common School"—Rt. Rev. Samuel Fallows, D.D., St. Paul's Reformed Episcopal Church, Adams street and Winchester avenue.

Lexington Avenue Baptist Church, 62d street and Lexington avenue—Rev. Melbourne P. Boynton, pastor. Sermon on educational topic.

Eglise Evangelique Francaise (Methodist Episcopal), 37th street and Langley avenue—Two addresses on "Education" in the French language. Rev. Arthur L. Allais, Rev. N. W. Deveneau, pastors.

St. Simon's Church (Episcopal), 1151 Leland avenue—Rev. W. B. Gwyn, pastor. Sermon on educational topic.

Trinity Episcopal Church, Michigan avenue and 26th street—Rev. John Moore McGann, pastor. Sermon on educational topic.

Church of the Epiphany (Episcopal), Ashland boulevard and Adams street—Rev. Franklyn Cole Sherman, rector. Sermon on educational topic.

FIRST DAY'S PROCEEDINGS

Opening Session—Monday Afternoon, July 8, 2:30 o'clock

The Fiftieth Annual Convention of the National Education Association was opened in the Auditorium Theater at Chicago, Ill., at 2:30 P.M. on July 8.

The opening was preceded by an organ recital, from 2:00 to 2:30 P.M., by Walter Spry, organist.

Grand Fantaisie in C	*Tours*
The Answer	*Wolstenhomle*
Spring Song	*Mendelssohn*
Star Spangled Banner	*Dudley Buck*
Träumerei	*Schumann*
Postlude in F	*John West*

President Harry Pratt Judson, of the University of Chicago, presided at the opening of this session.

Invocation.

Chairman Judson then introduced the following, who delivered addresses of welcome: Harry A. Wheeler, president of the Chamber of Commerce of the United States of America and former president of the Chicago Association of Commerce; and Francis G. Blair, state superintendent of public instruction, Springfield, Ill.

A response to the addresses of welcome was made by Thomas H. Harris, state superintendent of education for Louisiana, Baton Rouge, La.

Following the addresses of welcome and the response Chairman Judson introduced to the audience Carroll G. Pearse, of Milwaukee, Wis., president of the National Education Association, and transferred to him the conduct of the convention.

At this point President Carroll G. Pearse, superintendent of schools, Milwaukee, Wis., delivered the presidential address of the year.

Following the presidential address, President Pearse introduced the following speakers, who delivered addresses appropriate to the topic of the session, "The Half-Century Mark."

1. "Brief Historical Sketch of the First Teachers Association held in Chicago, Ill."—Josiah Little Pickard, LL.D., Cupertino, Cal. (read by Oliver S. Westcott, principal of Waller High School, Chicago, Ill.).
2. "The Rebirth of the Association in 1884"—Thomas W. Bicknell, Providence, R.I., president of the National Education Association in 1884.
3. "The Ideals of Half a Century"—Jacques W. Redway, Mount Vernon, N.Y.
4. "The Monuments: the Achievements of Fifty Years"—James M. Greenwood, superintendent of schools, Kansas City, Mo.
5. "The Coming Half-Century"—Ellen C. Sabin, president of Milwaukee-Downer College, Milwaukee, Wis.

The following Committee on Resolutions was announced by President Pearse:

COMMITTEE ON RESOLUTIONS

James W. Crabtree, of Wisconsin, *Chairman*

William M. Vance, of Ohio	William M. Davidson, of the District of Columbia
Florence Holbrook, of Illinois	Mary A. Monroe, of Washington
Robert J. Fuller, of Massachusetts	John W. Olsen, of Minnesota

Following the appointment of the Committee on Resolutions the convention adjourned to Tuesday morning, the active members of the Association reassembling by states either in sections of the Auditorium Theater or at their respective state headquarters for the selection of members of the nominating committee.

SECOND DAY'S PROCEEDINGS

SECOND SESSION—TUESDAY FORENOON, JULY 9, 9:30 O'CLOCK

The following musical program was presented from 8:45 to 9:30 A.M. by 1,400 children of the Chicago elementary schools:

1. Grand Chorus: American Hymn . . . . . *Keller*
2. (*a*) The Two Grenadiers . . . . . *Robert Schumann*
   (*b*) One Summer Morn . . . . . *Goetz*

Otis School. MISS STARRY CAROL, leader

3. Grand Chorus: (*a*) Patriot's Prayer . . . . . *Edward Grieg*
   (*b*) Cradle Song . . . . . *Wm. Taubert*
4. (*a*) Barcarolle (from "Tales of Hoffman") . . . . . *J. Offenbach*
   (*b*) Slumber Song of the River (from "Jocelyn") . . . . . *B. Godard*

Farren School. MISS ELIZABETH M. BLISH, leader

5. Grand Chorus: (*a*) God Ever Glorious . . . . . *Alex. Lwoff*
   (*b*) A Merry Life . . . . . *Denza*
6. (*a*) From a Railway Carriage . . . . . *Henry K. Hadley*
   (*b*) The Night Wind . . . . . *Henry K. Hadley*

Yates School. MISS ALMA HUNNENAN, leader

7. Grand Chorus: (*a*) The Song of a Thousand Years . . *Henry C. Work*
   (*b*) Star Spangled Banner . . . . . *Smith*

AGNES C. HEATH, Director
RALPH M. GERBER, Organ
LILLIAN F. ARCHIBALD, Piano
ELSIE M. HEATH, Piano

The convention was called to order at 9:30 A.M.

The topic of the session was "The American High School," and papers on this topic were presented as follows:

1. "Its Relations to the Schools Below"—Walter R. Siders, superintendent of schools, Pocatello, Idaho.
2. "Mortality in the Early Years: Some Administrative Remedies"—Adelaide Steele Baylor, assistant state superintendent of public instruction, Indianapolis, Ind.
3. "The Specialized or Vocational vs. the Composite High School"—Arthur Deerin Call,[1] principal of Henry Barnard School, Hartford, Conn.
4. "Social Organization in the High School"—Milton C. Potter, superintendent of schools, St. Paul, Minn.
5. "What the Public May Expect in Dividends: Material, Civic, and Social"—Kate Upson Clark, Brooklyn, N.Y.
6. "The Worship of The "Standard"—William Hughes Mearns, School of Pedagogy, Philadelphia, Pa.

The convention then adjourned to 8:00 P.M., on Tuesday evening.

THIRD SESSION—TUESDAY EVENING, JULY 9, 8:00 O'CLOCK

Preliminary to the opening of the session, Marcus Kellerman, of the Royal Opera House, Berlin, Germany, presented "Musical Interpretations" on the organ.

The convention was called to order by President Pearse at 8:00 o'clock, and the following program was presented on the topic of "A National University":

1. "The National Association of State Universities and the National University"—Edmund J. James, president of University of Illinois, Champaign, Ill.
2. "A National University, a National Asset; an Instrumentality for Advanced Research"—Charles R. Van Hise, president of University of Wisconsin, Madison, Wis.
3. "A National University as Related to Democracy"—James H. Baker, president of University of Colorado, Boulder, Colo.
4. "Ways and Means: the Next Steps"—William O. Thompson, president of Ohio State University, Columbus, Ohio.

After the close of the program, President Pearse announced the following Committee on Nominations:

[1] Now executive director, American Peace Society, Washington, D.C.

COMMITTEE ON NOMINATIONS

Robert J. Aley, of Maine, *Chairman*

C. C. Thach.....Alabama	G. W. A. Luckey.....Nebraska
Henry Q. Robertson....Arizona	W. J. Hunting.....Nevada
George B. Cook.....Arkansas	J. H. Fassett.....New Hampshire
Agnes Howe.....California	E. A. Farrington.....New Jersey
James H. Baker.....Colorado	R. H. Twining.....New Mexico
Arthur D. Call.....Connecticut	Katherine D. Blake..New York
(No appointment).....Delaware	James Y. Joyner.....North Carolina
William M. Davidson...Dist. of Col.	Charles C. Root.....North Dakota
I. I. Himes.....Florida	Edward M. Van Cleve Ohio
J. H. Guilliams.....Georgia	Edwin S. Monroe.....Oklahoma
Walter R. Siders.....Idaho	W. J. Kerr.....Oregon
William B. Owen.....Illinois	J. George Becht.....Pennsylvania
Linnaeus N. Hines.....Indiana	Mary Mugan.....Rhode Island
J. H. Beveridge.....Iowa	David B. Johnson.....South Carolina
M. E. Pearson.....Kansas	A. A. McDonald.....South Dakota
McHenry Rhoads.....Kentucky	L. E. Wolfe.....Tennessee
Thomas D. Boyd.....Louisiana	C. J. Lukin.....Texas
Robert J. Aley.....Maine	D. H. Christensen....Utah
Martha Stromberg.....Maryland	Guy Potter Benton..Vermont
Frederic Goodwin.....Massachusetts	(No appointment).....Virginia
E. A. Lyman.....Michigan	T. E. Hulse.....Washington
Florence Rood.....Minnesota	J. F. Marsh.....West Virginia
James W. Bell.....Mississippi	Margaret Canty.....Wisconsin
John R. Kirk.....Missouri	(No appointment).....Hawaii
W. E. Harmon.....Montana	George N. Briggs....Phil. Islands

THIRD DAY'S PROCEEDINGS

Fourth Session—Wednesday Evening, July 10, 8:00 o'clock

Preceding the opening of the session an organ recital was given by Arthur Dunham, organist, from 7:30 to 8:00 P.M., the following program being presented:

Chorale and Minuet	*Boellman*
Elevation (on the echo organ)	*Rousseau*
Burlesca e Melodia	*Baldwin*
Berceuse (from "Jocelyn")	*Godard*
Fanfare—Concert Étude	*Shelley*
Coronation March	*Meyerbeer*

The convention was called to order at 8:00 P.M. by President Pearse, who introduced the following speakers on the general topic, "The Relation of the Public Schools to the Movement for Recreational, Social, and Civic Opportunity":

1. "The Schoolhouse as a Social and Civic Center"—Frank P. Walsh, Kansas City, Mo.
2. "How a Community May Find Out and Plan for Its Recreational Needs"—Rowland Haynes, field representative, Playground and Recreation Association of America, New York, N.Y.
3. "The Relation of Schoolhouse Architecture to the Social Center Movement"—Dwight H. Perkins, Chicago, Ill.
4. "The Public Library, the Public School, and the Social Center Movement"—Arthur E. Bostwick, librarian, Public Library, St. Louis, Mo.
5. "The Organization and Administration of Recreation and Social Center Work"—Erich C. Stern, member of state legislature, Milwaukee, Wis.
6. "The School as a Recreation Center"—Jane Addams, head resident, Hull House, Chicago, Ill.
7. "The Social Center and the Rural Community"—Herbert Quick, editor of *Farm and Fireside*, Springfield, Ohio.

The convention then adjourned to Thursday evening, July 11.

FOURTH DAY'S PROCEEDINGS

Fifth Session—Thursday Evening, July 11, 8:00 o'clock

Preceding the opening of the convention, an organ recital was given by Arthur Dunham, organist, from 7:30 to 8:00 P.M., the following program being presented:

Concert Fantasy in C minor	*Batiste*
Prayer and Cradle Song (on the echo organ)	*Guilmant*
Wedding March	*Guilmant*
March from the Opera "Queen of Sheba"	*Gounod*
Capriccio	*Lemaigre*
Grand Chorus in G minor	*Hollins*

President Pearse called the convention to order at 8:00 o'clock and presented the following speakers on the general topic, "The Public Schools and the Public Health":

1. "The Duty of the State in the Medical Inspection of Schools; Results Which the Public May Rightfully Expect"—Fletcher B. Dresslar, specialist in school hygiene, Bureau of Education, Washington, D.C.
2. "The Teaching of Personal Hygiene in the Schools"—David Starr Jordan, president of Leland Stanford Junior University, Stanford University, Cal.
3. "Sanitary Education in Rural Communities"—Charles E. North, M.D., New York, N.Y.
4. "Medical Inspection and Medical Freedom"—Charles A. L. Reed, M.D., Cincinnati, Ohio.
5. "Some Problems in Education, as Related to the Public Health"—Harvey W. Wiley, contributing editor and director of Bureau of Foods and Health, *Good Housekeeping Magazine*, Washington, D.C.

The convention then adjourned to Friday forenoon, July 12.

FIFTH DAY'S PROCEEDINGS

Sixth Session—Friday Forenoon, July 12, 9:30 o'clock

President Pearse called the convention to order at 9:30 o'clock and presented the following speakers on the general topic, "Rural Life Conditions and Rural Education":

1. "A Social and Educational Survey of the Rural Community"—Warren H. Wilson, superintendent of the Presbyterian Department of Church and Country Life, New York, N.Y.
2. "What Is Being Done to Meet the Problem":
   - *a*) "By the Schools of Guilford County, North Carolina"—T. R. Foust, county superintendent, Greensboro, N.C.
   - *b*) "By the State of Oregon"—L. R. Alderman, state superintendent of public instruction, Salem, Ore.
   - *c*) "By the State of North Dakota"—John H. Worst, president of State Agricultural College and Government Experiment Station, Agricultural College, N.Dak.
3. "The Humanity of Highways"—Mrs. Frank DeGarmo, director of Country Life Department, National Congress of Mothers, St. Louis, Mo.
4. "The School, the College, and the English Farmer"—E. J. Russell, director of Rothamsted Experimental Station, Harpenden, England.
5. "What the National Government Can Do"—Philander P. Claxton, United States commissioner of education, Washington, D.C.

The convention then adjourned to Friday evening, July 12.

Seventh Session—Friday Evening, July 12, 8:00 o'clock

Preliminary to the opening of the session, Arthur Dunham, organist, presented the following musical program:

Bell Rondo	*Morandi*
Andantino in D flat (on the echo organ)	*Lemare*
Toccata in G	*Dubois*
Overture to "Tancredi"	*Rossini*
Song without Words	*Tschaikowski*
March from "Tannhäuser"	*Wagner*

The convention was called to order by President Pearse at 8:00 o'clock, and the following program was presented:

1. "The Best Next Thing for the Teaching Profession"—Albert E. Winship, editor of *Journal of Education*, Boston, Mass.
2. "Peace and Arbitration"—Baroness Bertha von Suttner, Vienna, Austria.
3. "Camp-Fire Girls"—Gerda Sebbelov, general secretary of the Camp-Fire Girls, New York, N.Y.
4. "The Camp-Fire Girls and the New Relation of Women to the World"—Luther Halsey Gulick, director of Department of Child Hygiene, Russell Sage Foundation, New York, N.Y.

Following the address of Director Gulick, President Pearse introduced Mrs. Ella Flagg Young, superintendent of schools of Chicago, who spoke briefly, thanking the members of the Association for their attendance and contributions to the success of the Fiftieth Convention of the National Education Association.

President Pearse then introduced Hon. Edward T. Fairchild, president-elect of the National Education Association.

Mr. Fairchild responded in a brief address of thanks for the honor which had been bestowed upon him, pledging his devotion to the interests of the National Education Association intrusted to him, as follows:

In behalf of this Association I wish to thank you, Mr. President, for the helpful, instructive, and inspiring program provided. Permit me also to congratulate you upon the eminently fair and just manner in which you have discharged your duties as presiding officer.

To you, ladies and gentlemen, members of the National Education Association, I wish to express my sincere appreciation of the great honor you have conferred upon me. For twenty-seven years my name has been borne upon the roll of this organization as a life member. I have read with interest its proceedings and have gone to its reports as to "a court of last resort." For me the deliberations and conclusions of the National Education Association have been a constant source of guidance and inspiration. Its roster of fifty years carries the names of America's greatest educators. Its influence for good is immeasurable. Such is its past history. As for the future, may it meet fully the newer and greater demands. May it continue to be the most powerful instrument in the world for the development of the highest and best in national life and character; for the establishment of equal educational opportunity!

For myself, I believe in a progressivism that holds fast to all that is good and forsakes all that is evil; that seeks not to destroy, but to upbuild; that attempts to meet twentieth-century demands by applying twentieth-century methods.

May I propose this sentiment: The teachers of the United States. May they ever continue to be loyal, patriotic, God-fearing men and women, devoted to the great work of inspiring our youth with high ideals and lofty purposes; and may they ever be so consecrated with the spirit of unselfish devotion to the great work of teaching that only good examples shall be set. May they grow in grace and kindliness of spirit and may still higher purposes and nobler aspirations fill their hearts and minds to the exclusion of all lesser things.

To this body of kingly citizens, and citizen kings, all hail!

President Carroll G. Pearse, after brief remarks of cordial thanks to all members of the Association for co-operation during the year just over, invited the Association to join in singing "America" as the closing exercise of the Fiftieth Convention of the National Education Association.

IRWIN SHEPARD, *Secretary*

GENERAL SESSIONS OF THE ASSOCIATION

ADDRESS OF WELCOME

HON. FRANCIS G. BLAIR, STATE SUPERINTENDENT OF PUBLIC INSTRUCTION FOR ILLINOIS, SPRINGFIELD, ILL.

Plato in accounting for the existence of organic life assumed the existence of two antecedent worlds: one, a world of ideas placed by him somewhat indefinitely in the heavens; the other, a dead inert world of matter. In his world of idealism he placed an idea for every species of living thing. In the fullness of time that idea exerts a miraculous power upon the nether world of matter until

> Every clod seems to feel a stir of might,
> An instinct within it that reaches and towers
> And groping blindly above it for light,
> Climbs to a soul in grass and flowers.

Plato believed that matter was shaped into forms of loveliness and beauty thru the influence of a spiritual thing—an idea. Of course, with our modern scientific thought and experiment, we have outgrown Plato's fancy as a sufficient explanation of the origin of the animate world. Our modern materialistic philosophers go quite to the other extreme. They would have us believe that everything is the product of the blind forces of nature. If we understand clearly their inductions, they hold that man, the highest form of life, is physically, mentally, and morally the direct result of the flux and flow of great natural forces which have played upon him from the very beginning, whatever that beginning may have been. His physical form, the shape of his head, the color of his eye, the color of his hair, the hue of his skin, all his physical attributes are the direct effects of wind and wave, of mountain and valley, of heat and cold, of moisture and dryness. And such an array of evidence is brought forward that every one of us must be willing to admit the strength of the argument. But they go still farther and hold forth that the intellectual powers of man are also the result of these same physiographic forces. If man is born in the region of the poles, where the nights and winters are long, where there is very little variety of plant and animal life, his mind is dwarfed. And under the opposite physical conditions on the arid stretches of the torrid zones, intellectual mediocrity is the result. It is only in the great temperate zones, with their rhythm of night and day, of spring and summer and winter, with their great variety of animal and vegetable life, with their pageants of bud and blossom and fruit, that man attains his highest intellectual power and his greatest variety of imagination. Still farther they go, and assert that in his institutional and religious thought and life he

is a creature of these same material forces; that out of the great womb of nature he springs; that he is fashioned completely by her and unto her in the end he returns again to become "a brother to the insensible clod."

After granting much of this array of facts and inductions, after admitting that man is influenced very greatly physically, mentally, and morally by the earth forces that play upon him—after granting all that—we must not forget, and we must continue to state that one of the most forming and transforming forces that plays upon him is not a physical force but a spiritual force. We cannot for a moment admit that the sum-total of man's environment consists of mountains and streams, winds and weather, and mere physical forces. We must not overlook the fact that the most potent part of his environment may be an idea, a sentiment, an enthusiasm. Take the great idea of service which was slowly evolved thru the Hebrew nation and perfected in the life of the Great Master. When it was once liberated, how it swept around the world, changing the thought, the sentiment, and the life of the people. How it entered into the hearts and minds of men and women and changed their attitudes toward themselves and toward each other. How it entered into the home and gave it its most sacred touch. How it entered the imaginations of men and women and changed the form of their literary expression so that every page glowed with a fervor and a beauty never known before. How it leaped into the paint and brush of the painter and made his canvas blaze forth with a new intensity and power. How it touched the heart of the architect and was bodied forth in lofty spires and magnificent cathedrals. How it caught the arm of the sculptor and in hammered brass and carved stone brought forth new forms of loveliness and beauty. How it changed constitutions and laws and federations. How it took men and women born under vastly different physiographic conditions, whose ancestors for centuries had lived under these dissimilar conditions, and by giving them a new birth thru this idea transformed them into a unity of faith, a unity of spirit, and a unity of conduct.

Yes, let science continue to explore the world of nature and let us honestly accept every finding that is true, but let us not lose our faith in the power of an idea. And it is because you, the teachers of America, represent that world of ideas and hold it above this world of industrialism and materialism; it is because you believe that boys and girls are not transformed into men and women merely by what they eat or by mere physical forces, but that their tastes, temperaments, habits of thought, and their characters are shaped by a body of ideas, a body of sentiments, a body of enthusiasm; it is because you are the keepers of the holy grail of truth, because you are the knights-errant of ideas and ideals, that we welcome you to this great metropolis of the Middle West and to this great commonwealth which lies at the very heart of the nation. Geographically, Illinois is a part of the entire nation. When Nathaniel Pope, the terri-

torial delegate to Congress, asked that body to extend the territory of the state up to the western shore of Lake Michigan, far beyond the limit set by the conditions of the Northwestern Ordinance, he was asked to state his reason. In substance he replied: "You have fears that the day will come when the North and the South will separate. You also fear that with the development of the great territory beyond the Mississippi the commonwealths there formed will be out of spiritual contact and sympathy with the East and will tend to fall away. If you will give the territorial limits to this state which I am asking, letting it reach to the far North and down to the very heart of the Southland, you will make a state that will bind together forever the North and the South with a bond which, tho misunderstanding and passion may strain, can never be broken. You will fashion a state lying midway between the East and the West that shall hold together, in bonds of sympathy and common interests, the great nation that is yet to be." So that in a very peculiar sense Illinois, geographically, is the very heart of the nation. But there is another sense, and one that is much more significant, in which Illinois occupies a central place in the nation. Here on these stretching prairies lived and grew to maturity a man gaunt of form and large of stature, in whose heart and mind was a world of ideas and sentiments nation-wide in their scope. Here on this great western frontier with the wild forces of pioneer life playing about him he kept his feet firmly planted upon the earth, but his head was touched with the light of truth and sentiment and national idealism. He looked upon the North and the South, upon the East and the West, and in the great womb of his heart, thru much travail and pain, we were all born into a new citizenship. And it is with peculiar pride that, as a citizen and an official of this commonwealth, I invite you to enter into it thru the heart and mind and life of Abraham Lincoln, who believed in nature, who believed in material forces, who believed in great industrial activity, but who believed that an idea, a principle, was above and over them all as a shaping, forming influence upon the lives of men.

RESPONSE TO ADDRESS OF WELCOME

HON. THOMAS H. HARRIS, STATE SUPERINTENDENT OF EDUCATION FOR LOUISIANA, BATON ROUGE, LA.

As spokesman for the visitors assembled here, I desire to express grateful appreciation of the kindly welcome which has just been extended by the state superintendent of Illinois, Hon. Francis G. Blair.

Chicago is a fitting place for teachers to assemble for the discussion and solution of their problems. Its public-school system, headed by one of the wisest and most progressive superintendents in the country, has settled many of the questions that are annoying some of us; its great university is blazing a clear and sane way in the field of higher education; and its

progressive commercial spirit is an example in thrift and organization to other cities. We have been assured that the city, with its facilities for instruction and entertainment, is ours. Availing ourselves of the kindly proffered hospitality, we shall be able to profit by the educational and industrial achievements about which we shall learn by appropriating the ideas that can be utilized in the work we are attempting at home.

Every section of the United States is represented here, and every phase of educational endeavor has in this assembly its friends who are here to promote its best interests. The President has warned me that I am not expected to say anything, and that I shall be given only a few minutes in which to say nothing; and accepting in proper spirit the limitations that hedge me in, I shall call attention to only one of the many questions that are engaging the attention of school men thruout this country at the present time, namely, the importance of utilizing the practical world about us in the education of the child.

For many years business men have believed that the schools were doing too little for the masses who work in the trades and industries, and were being conducted too largely in the interest of the few. The man who works in the shop, in the store, and on the farm has been asking why it is that a boy's education cannot be made to square with the world in which he must live and work. The schools are attempting to respond to these demands of a practical public. Some cities are organizing their schools in sympathy with the commercial and industrial conditions that exist in them, and while the rural portions of the country are always the last to receive intelligent attention, yet here and there a country school is organized to serve to advantage the community that supports it. School men are saying that the school campus should be a map, socially, spiritually, and industrially, of the community for whose benefit the school was created; in practice, however, we have just begun to attempt seriously to draw the map. A few city-school systems are bringing the shop, the forge, the bank, the store, and other urban industries into the schools and are successfully using them in the education of the cities' children, and a half-hearted attempt is being made in an occasional country school to modify the course of study, that was prepared a thousand years ago for preachers and lawyers, for a course designed to acquaint country boys and girls with the life and duties about them. Institutions that are based upon traditions which have come down thru the ages are slow to make changes (and rightly so), and constructive work that deserves to live permanently advances slowly, being subjected to the tests and corrections necessary to guarantee results sane in conception and correct in execution. It may be well, therefore, that we have felt our way in the matter of introducing the activities of the practical world into our school courses.

This principle of cautious procedure will not be violated now that the experimental stage has been passed by the adoption of machinery necessary

to promote such practical education as should be promoted. Sentiment in the cities can always be created in favor of any worthy educational cause, and funds can be raised for its support. There need be no special worry, therefore, over the question of shaping city-school courses to meet the needs of city people. The situation in the country is different. There the public conscience is not easily aroused, and funds for the support of needed institutions are raised with difficulty. The isolated situation of the farmer creates satisfaction with conditions that are heart-rending, and his poverty prevents him from changing the conditions even when he aspires to better things.

The country schools should be lifted from their tragical position and organized to serve to better purpose the millions of country people who constitute our most important industrial class. This can be done only thru the leadership and financial assistance of forces outside of the rural sections. At the head of these forces should be the United States government. Congress should aid the states thru the state colleges and normal schools to train teachers for proper service in the country schools, and it should assist in the organization and maintenance of country schools in all of the states that approach the ideal of offering instruction suited to the needs of country conditions. Millions spent annually in this way with the view to making a better citizen of the man in the country would prove one of the most valuable investments the national government has ever made. The question of national interference with the state systems of public schools is unworthy of consideration. Such national supervision as would be necessary to insure the wise expenditure of national funds could be exercised by the national Department of Education, not only without doing violence to the spirit of local school government, but to the uplift of local educational ideals. This has been true of the agricultural and mechanical colleges, and it would be true of the country schools.

Thru the leadership and financial assistance of the national government, the extension departments of the state colleges are performing a wonderful service in certain departments of public-school work in many sections of the country; an extraneous stimulus has accomplished even greater results in the field of secondary education, and all this without encroaching upon local authority.

The greatest question before the American people today is the creation of a country school that can properly educate the millions of our country population. Our national industrial prosperity and the perpetuity of our democratic institutions depend upon an intelligent, efficient rural citizenship, and to the realization of that ideal the national government should contribute leadership and millions of its funds.

If the teachers of the United States, representing all departments of public-school effort—colleges, state normal schools, high and elementary schools—would unite upon a sane, broad program, and present to Congress

an earnest, nation-wide appeal for the country school, Congress would respond to the appeal, and a stimulus would be provided for the removal of the lowly, tragical, heart-rending conditions that surround the children in the rural districts of this country.

PAPERS AND DISCUSSIONS

PRESIDENT'S ADDRESS

CARROLL G. PEARSE, SUPERINTENDENT OF SCHOOLS, MILWAUKEE, WIS.; PRESIDENT OF THE NATIONAL EDUCATION ASSOCIATION

Our public educational system stands in the presence of great impending changes. It is becoming yearly more certain that a radical readjustment of our conception of public-school education, its province, its methods, its details of administration, is demanded by the conditions of the day.

The curriculum of the public schools was shaped when a comparatively small part of the education of children was given at school; to read, to write, to compute in a simple way—these were the arts taught. Habits of industry and application to practical affairs were acquired at home; in connection with these lessons in industry, children got from their parents lessons in honesty and truthfulness; they learned to feel that obligation which a good citizen owes to his family, to his neighbor, to the organized community, and to the state. The home and the church had a large part in the work of education; requirements comparatively much lighter were laid upon the school.

The educated leaders among our early settlers, who shaped our standards of education, had, in addition to the education in the homely things of life which was assumed as a matter of course, a large knowledge of the wisdom set down in books. Their grammar schools and academies, designed to fit boys for the college, and the college itself took on almost exclusively the ideals of book learning.

When Horace Mann preached his crusade of education for all the people it was this ideal which moved him; all the youths of the land were to be given the education in books which was in accord with the ideas of the educated men of that day. And the high schools, which everywhere sprang up, were planned to cover only that portion of the circle of education which was deemed within their province at a time when a large part of the circle was covered by the activities of the home. The education of the nation today is still largely in the mold which was shaped by the conditions and influences prevailing in its formative days; the subjects thought worthy of study in the schools of the people have been until recently, and in thousands of schools still are, those which were proper under industrial and social conditions which have passed away.

The schools are still using a daily time schedule shaped by conditions which, so far as our cities and towns are concerned, no longer exist. The arrangement by which the schools opened in the morning at nine o'clock and closed in the afternoon at four o'clock, with an hour at noon for the luncheon which in most cases was brought from home and eaten at the school, was not accidental; it had a real economic reason, based on the industrial conditions in the homes. The nine-o'clock opening, an hour or more later than the German boy begins his schools tasks, served to allow all the children who were above babyhood to help in the morning about the farmyard "chores" and the household tasks. The four-o'clock dismissal in the afternoon not only permitted all the children to reach home before dark, tho the distance might be considerable, but permitted them time to assist in performing the evening farmyard and household duties: out of doors, to feed and house the farm animals, attend to the milking, and see that the wood was brought; indoors, to help with the supper and be busy with the tasks which had accumulated during the day.

Our universal weekly time-table bears the marks of a similar origin. Abroad, it is common to find the week broken by a midweek and a week end—a Wednesday afternoon and a Saturday afternoon—half-holiday. With us, the schools are dismissed and the schoolhouse bell is silent thruout all of Saturday. Our New England ancestors, from whom we have inherited most of the details of our school system, were a Sabbath-observing people. The work to be done on that day was reduced to a minimum. Saturday not only brought the necessity for clearing off the arrears of the week, but all possible preparation must be made for the day of rest which was to follow. This service kept busy all the hands, the small ones of the family as well as those larger and stronger.

In the yearly arrangement of terms and vacations the same shaping influences can be seen. It is true that energy is not so abounding in the heated season and it might, at first thought, be supposed that this offered an explanation for the long summer vacation. But it will be remembered that the work of field and farmhouse never intermitted on account of hot weather and that the most strenuous farm work was done during the summer. In the seasonal necessities of an agricultural community will be found the real cause for the long summer vacation. Keeping the weeds out of the corn and potatoes during the season of their most rapid growth; the haying and harvesting; the care of the kitchen garden; the gathering of vegetables and fruits and preserving them for winter use—all these filled busy hands thru the hours of long summer days with labors which must be performed at just the time set by the succeeding necessities of growth and ripening. And so, from early summer to early autumn, the schoolhouse door was closed and dust gathered on the books, while the pupils, merged in the industrial community, were receiving industrio-vocational education of a purposeful and practical quality which falls to the lot of too few of the boys and girls of today.

The part borne by the home in the education of our children, to fit them for usefulness and give them power, has shrunk like a snowbank in spring; the industrial and social conditions, in our cities and towns, at least, are such that the stream of home educational efficiency, once flowing strong and full, has become a mere trickle.

The old system had many defects; its teachers were too often poor in skill and in knowledge; its appliances were crude; its organization was rudimentary. But the home and life were its powerful allies; and much of its product was far beyond what the school alone could have shown. We who are charged with the responsibility for public education stand confronted by the necessity of bringing back the schools into touch with life; it is required of us that we cease to try to educate the children of the people in institutions shaped to meet conditions which existed among us two or three generations ago.

Altho in general, to date, least effort toward readjustment has been made in the rural schools, the situation there is simplest and easiest to solve. There still remains the opportunity for co-operation with the home; there, useful labor, under wholesome conditions in company with father and mother, is available as an aid to build strong muscles and nerves and vital organs, to train to application and industry, and to give the power to bear responsibility creditably and meet emergencies with self-reliance. Much still remains to be done in the consolidation of the scattered small schools into larger ones, where better equipment and classification are possible and where better teachers can be paid for. Something remains, also, to be done by way of enriching the curriculum and bringing into it, not only more of the culture of the past and the wisdom of the world today, but also such applications of our scientific and commercial and social knowledge to the practical affairs of rural life as shall make for larger returns from the soil, and its betterment rather then its exhaustion; a higher quality of live stock and live-stock products; a clearer understanding of the best methods of marketing crops and purchasing supplies and equipment, as well as more intelligence in keeping farm accounts and showing profits or losses; and a truer understanding of the value and possibilities which the rural home offers for social life and recreation.

The problem of "bringing back" the city school is, however, more difficult. Already something has been done to recast the course of studies in the light of present-day demands. Numbers of schools have introduced physical training to help in straightening stooped shoulders, developing flabby muscles, giving a good carriage in standing or walking, and developing muscular control and steadiness of nerve. But far more needs to be done; the few exercises possible in the small time now available can only start the good work. More exercise of definite sort must be given to develop poise and control; but far more out-of-door exercise must be allowed for increasing general vigor and vivacity. A powerful

agency for this will be found in the sports and games in which all normal young persons delight. Not only must time be allowed for these, and, where necessary, supervision and suggestion or direction provided, but adequate play space must be put at the disposal of the young people of the school, both during school time and at other hours. The school grounds should be the neighborhood center for play and sports, summer and winter. From these playing-fields it will not be wise to exclude those games and forms of sport which involve contest—struggle, either personal or between teams. Some of the most virile and valuable qualities of the race have been developed by struggle; if these qualities are not to fail from among us, some place must be provided where all the young people, not merely a small number picked for athletic prowess, may have a chance to develop those qualities.

In many places efforts have been made, in some instances feeble, in others well considered and effective, to provide some exercises which shall give to pupils some of that touch with real things, that knowledge of how to do things with the hands, that development of nerve tracts and nerve quality, and of brain areas and general brain power, that, to thousands in the past, came from work in the field and the forest, in the barn and the shop, in the kitchen garden and at the loom, at the wash tub and the wood pile. Whittling and joinery for the boys and the sewing and cooking which girls do in many elementary schools are of real value toward the solution of this problem. The drawing and clay modeling often given furnish an opportunity for self-expression, for the creation of beautiful forms or the development and grouping of conventional forms of artistic design adapted from beautiful objects found in nature. This opportunity for expression and for the exercise of taste and skill in originating and applying designs used to come to the boy who made and decorated his sled or the piece of furniture for use in the home; or to the girl who designed the pattern and wove the linen, the rug, the carpet; who fashioned her own garments or trimmed her hat, or laid out the garden flower bed and arranged its harmony of colors. The beginnings have been good; but they are only beginnings. Two or three hours per week are grossly inadequate to develop hand skill and artistic taste, and to build up power and ability to execute. The time for this work must be extended until an hour or an hour and a half can be found each week day, instead of only an hour or an hour and a half during the week. This time will suffice to do some real work: the girl can get some real knowledge of, and some skill in, sewing and cooking and caring for the various rooms of the house, in the cutting and fitting of family garments, in caring for the sick and for little children; the boy can get better hand training; he will be able, not only to use tools, but to repair articles and have time to design things and to make them. Both boys and girls can not only get skill and knowledge, but form habits of application and effectiveness—something which the time now available does not permit;

both will have time to study the underlying principles of design and decoration and the methods of applying these to the work they do.

Less time, rather than more, will be spent on arithmetic; but more, much more, on the essential operations, to give a surer mastery and readier use of the processes which are most used and necessary. Less time will go to the study of grammar—but that time will go to a better selected list of fundamental topics; and more time, much more, will be given to oral and written expression by the boys and girls; they will have far more thoro training "to say right on," plainly, directly, and forcibly, in spoken or in written words, whatever they have to say.

When the curriculum has been reconstructed in the light of the needs of the life of our people—and not forgetting the life which awaits the youth whose formal education must end with the elementary schools because it is necessary for them to enter the great army of workers—our boys and girls will not have been taught any special employment or handicraft; the common schools are not for that. No specious plea for "pre-vocational" education will have made it possible to rob the children of their birthright in the schools of the people by selecting out those who are to be "devoted to labor" and giving to them some special training to make them more readily useful as factory workers. But every pupil coming from the schoolroom doors at the end of the elementary-school course will have had such training as will make it easily possible for him, if conditions permit, to go on into the high school, and thence to college. But if necessity calls to labor, instead of permitting further progress in school, the boy will go with hands possessed of sufficient skill to acquire expeditiously any handicraft to which he may apply himself, or, if he does not follow mechanical employment, to make it sure that he will not stand helpless in the presence of a shelf which needs to be put up, a door to be hung, or a fence to be repaired. The girl will be able to do the things that fall to the lot of a house-mother if fate calls her, as it does most women, to that duty. Both the boy and the girl will have such a grounding in the elements of arithmetic and the use of language as to be ready and well able to learn quickly the methods used in noting and recording the transactions in any place of business, and in making the computations required and extending the results.

All will have acquired some knowledge as to how the soil is prepared and seeds are planted, how plants grow and are cultivated, how the vegetables and fruits and flowers are gathered and made ready for the uses of men; they will understand the ministry of the frost and the heat, the rain and the sunshine; the blessed smell of the soil will be familiar in their nostrils, and they will know the feeling of wholesome dirt between their fingers and toes. Each will have a fair and practical knowledge of our history and the methods by which we govern ourselves and carry on the business of the general and local governments. Each will have a body as

straight and vigorous, as well schooled to control, and as sound as heredity and home conditions render possible.

It is not necessary to say that the hours devoted to school exercises, according to the daily and weekly schedule now in use, are not sufficient for these things; all of us realize it. But a school day adopted under conditions which no longer exist is not a sacred thing; there is no reason why the school day should not be lengthened and the weekly schedule modified to meet the conditions of today. The school day has even been generally shortened within a generation, largely because the general strength and the nervous systems of our children were being overtaxed by the kind of school exercises, almost exclusively interior and sedentary, which they were required to perform. But with a proper readjustment and arrangement of exercises there appears no reason why the schedule should not include the new work, and the extension of old work proposed.

More equipment for manual work and more teachers for it will render practicable the extension needed here; more time allotted to physical exercises and especially more time devoted to outdoor play and to sports and games will give what is necessary there; more land for play and sports and for planting and cultivating growing things will make it possible for the pupils to receive the education which is to be derived from these activities. And a proper rearrangement of employments, the alternation of inside work with work in the freedom of the open air, lessons in books with handwork or with work in the school garden, or with activity upon the playground, will bring children to the end of the elementary-school period, not less vigorous and healthy than at present, but rather stronger, in better health, and in every way better equipped and trained for whatever tasks life may bring them.

And in this reconstruction of the program it will probably be recognized that the Creator did not intend that entire abstention from labor should occur during the summer months; the growing season in nature may very well be the growing season for human beings, not only physically, but intellectually and in the formation of worthy habits. If school exercises are intermitted in summer in the rural schools, it should be chiefly because the pupils can have education of a different but equally valuable sort given to them otherwise. Some fortunate children in town can be taken by their parents to the country for the summer, but for most it is impossible; they must remain in the town. It should not be difficult so to arrange the school exercises of the year that this great majority of children would be far more profitably, wholesomely, and agreeably occupied than in running the streets as they too often do under present conditions.

This readjustment need not be at the expense of the teacher's strength or comfort. Doubtless the beginnings of the new order would be painful to those who had fallen into ruts, and to those who had become firmly estab-

lished in routine and mechanical habits of work; whenever any new plan is undertaken, we expect groanings from this small minority of teachers and these groanings seldom belong to that class "which cannot be uttered." But altho the school day must necessarily be lengthened, the change from indoor to outdoor conditions and the variety in the work would relax the tension and break up the continuous application to tasks so similar that they beget schoolroom fatigue. The supervision of the outdoor play and of the school-garden and field work should furnish a grateful relief, and render the work of the day much less exhausting. Of course the special work—that in manual training and household arts, and in systematic gymnastics—should be done by special teachers, and the regular teachers relieved during the time the classes are thus engaged. This would allow time in which the teacher would be free from responsibility for the class; it could be used in relaxation, or it could be used for checking up and planning school work and lessons instead of doing this work after school, or at home in the evening.

One other pressing problem demands consideration in this connection: Will the constructive exercises of the school have their full value if the product of these exercises lacks real utility? Children in the home, for ages, have taken part in the real work of life; they have produced or helped to produce articles for family consumption or for sale. Can the manual, the constructive work of the school, have the vital educative effect which is so important unless the things made in the school shop or raised in the school garden are real things, for practical use or for sale? It is not at all certain that we shall not find that this practical quality is necessary; that children must have restored to them thru the instrumentality of the school the right to work at productive labor, as a vital part of a proper education. They must be kept from grinding toil in mills and factories; but they have thrived on suitable labor, under proper conditions and oversight, since time began. It may be that this opportunity can come in connection with the school, by centering the manual work, in shop and garden, chiefly upon suitable articles having economic value—articles which can be used or sold. It may be that it can come by some arrangement between the school and the industries; and an agreement by which a considerable share of the time devoted to handwork may be employed in some suitable industrial establishment, at work of immediate, concrete commercial value. It may be in one way, it may be in another; but we must ascertain if some way cannot be found for restoring to our boys and girls their right to that education which comes from proper labor, suited to their age and strength, and performed under right conditions. We must answer the question whether important and valuable qualities of our national character do not depend for their development and perpetuation upon the restoration to our children of their right to perform suitable and useful labor during their formative years.

TOPIC: THE NATIONAL EDUCATION ASSOCIATION—THE HALF-CENTURY MARK

A. BRIEF HISTORICAL SKETCH OF THE FIRST TEACHERS ASSOCIATION HELD IN CHICAGO, ILL.

JOSIAH LITTLE PICKARD, LL.D., CUPERTINO, CAL.

(*Read by Oliver S. Westcott, Principal of Waller High School, Chicago, Ill.*)

The convention of teachers was called in October, 1846, by J. Y. Scammon, G. W. Meeker, and others interested in the cause of public education, to be held in Chicago. It was an invitation of national character, as was evident from the response to the call. New York was represented by Salem Town, author of school textbooks popular at that time; Mr. Pierce, an organizer of teachers institutes; and W. F. Phelps, a recent graduate from D. P. Page's Normal School at Albany.

Governor Slade of Vermont was at that time engaged in securing places in the West for female teachers. It was probably on his suggestion that a delegation so timed their journey as to be present at the Chicago meeting.

The homes of prominent citizens were opened for the entertainment of all in attendance from outside the city. The plan of the originators of the convention was for a three days' session. No program had been prepared, but the addresses of the gentlemen from New York elicited warm discussion, and the interest became so great that an invitation was extended to the gentlemen above named to remain and conduct a normal institute similar to those held in New York and adjoining states. The hosts cordially extended the welcome to their guests. The teachers of the city attended evening sessions, and the young ladies of the Chicago Female Seminary were often present during the day sessions. So great was the interest that for the last afternoon of the convention the public schools were closed and an outdoor meeting was held in the courthouse square, since there was no hall of sufficient size in the city to accommodate the audience.

It is impossible for me to give a detailed account of the exercises, but I may speak of the aftermath; for the seed sown in that convention has not perished, but, to my mind, is the living root which appears in the vigorous growth now harvested each year by the National Education Association.

Mr. Phelps, participant in the sowing, lived many years to witness the harvest and in 1876 presided over the reapers as president of the National Educational Association in Baltimore. He organized the State Normal School of New Jersey in 1855 and in 1857 the Farnum Preparatory School in Beverly, N.J. He was principal of Minnesota State Normal School 1864 to 1876 and president of Wisconsin State Normal School at Whitewater 1876–78. At the ripe age of eighty-six he passed away in St. Paul, Minn.

Inspired by the meetings, not one of which failed to interest me, I

returned to my home. The longing for sympathy of fellow-laborers, which had so cheered me at the Chicago convention, grew in intensity. Interest in popular education in the mining region covering a part of southwestern Wisconsin, northwestern Illinois, and central eastern Iowa was at low ebb. Thru personal correspondence the teachers of the region, anxious for better acquaintance, and for help in the work which was discouraging, met at Platteville, Wis., and before parting organized the Mining Region Teachers Association. For five years the Association met annually in one of the three states. Dr. Azel P. Ladd, a resident of the mining region, a warm friend of public education, was elected state superintendent of public instruction for Wisconsin and entered upon the duties of his office in 1852. Having witnessed the results of the Mining Region Teachers Association, he determined, if possible, to secure the organization of a state association. Pursuant to his call for a meeting of friends of such an association, seven men, four of them teachers, met at his office in Madison, August, 1853. After conference, an organization was perfected and a constitution was adopted extending the privilege of membership to all "friends of education." Provision was made for a meeting in August of each year. (Illinois followed in December, 1853, and Iowa in May, 1854.) It is presumed that the Wisconsin association was exceptional in the difficulties it encountered in the first years of its organization, but the spirit of the leaders had no fear of the possibility of failure.

The second meeting would have discouraged men of ordinary pluck. On gathering at Madison in 1854, Dr. Ladd's successor could not be found. No provision had been made for a place of meeting. Six friends of education representing six schoolbook publishing houses greeted five teachers wandering around the hotel. At last one hunted up the sheriff and obtained the key to the courthouse; another bought a pound of candles for lighting. At the evening session the audience consisted of one gentleman who gave close attention to the president as he read his address. Our joy in having one hearer was stilled when we learned that he was "stone deaf." The five teachers present, foreseeing the danger of "special interests" control, took advantage of their opportunity, and amended the constitution by admitting only teachers to active membership.

Thru the persistent energy of President McMynn the third meeting at Racine was a triumphant success, and the Wisconsin State Teachers Association holds sway in educational matters in the state.

In the call for a meeting for the purpose of organizing a national association, the three state associations named as successors to the Mining Region Teachers Association, itself a child of the Chicago convention of 1846, were represented by their respective presidents. With all these gentlemen it was my privilege to be a colaborer in the early 50's.

The chairman of the convention was an Iowa man, who was also an active member of the Mining Region Teachers Association at its last session in 1852.

The claim to parentage of the National Education Association may be questioned, but I think prenatal conditions affecting its character may be traced in some measure to the convention of 1846 in Chicago.

When I entered upon my work in Chicago in 1864, the names of the school buildings carried me back eighteen years to gentlemen who were promoters of the convention of 1846. Messrs. Jones, Scammon, Kinzie, Brown, Ogden, Newberry, and Foster were still in active business life and were still warm supporters of the public-school system of the city.

In 1846 the blockhouse built for the defense of the city was standing at the mouth of the harbor, but the Dearborn School, named in honor of General Dearborn, United States Army, proved a better means of defense to the city and the blockhouse has been removed.

B. THE REBIRTH OF THE ASSOCIATION IN 1884

THOMAS W. BICKNELL, PROVIDENCE, R.I., PRESIDENT OF THE NATIONAL EDUCATIONAL ASSOCIATION IN 1884

In the city of Philadelphia, August, 1857, a small company of earnest teachers of New England, the middle and central western states, organized THE NATIONAL TEACHERS ASSOCIATION, "to elevate the character and advance the interests of the profession of teaching, and to promote the cause of popular education in the United States." The American Institute of Instruction was twenty-seven years old and the oldest normal school was eighteen. "The little red schoolhouse" in the East and the log-cabin school in the Central West were the prevailing types of American school architecture, wherein persons of little learning and no professional training essayed to teach what the elementary textbooks of arithmetic, geography, grammar, and spelling held within their covers.

This was the primary period of American education. Thirteen years later, at Cleveland, the name became "THE NATIONAL EDUCATIONAL ASSOCIATION," which it held until 1907, when, by act of Congress, its charter name became "THE NATIONAL EDUCATION ASSOCIATION OF THE UNITED STATES." The changes in the name were important, but of little worth compared with the development of the Association in its structure, functions, and work.

Today, after fifty-five years of life, and on the Fiftieth Anniversary meeting, the National Education Association is the most influential organization of its kind among civilized nations. Its possible teaching constituency is at least three-quarters of a million persons. The breadth of its work includes all grades from the kindergarten thru the university. There is no educational question too minute for its consideration, none too philosophic for its solution. Its various departments, including its crowning glory, the National Council of Education, individualize, differentiate, and specialize educational studies and focalize professional

forces. Its methods of procedure are democratic and progressive, while its influence outruns its years, and makes it at this anniversary the most potent agency in the educational world, representing as it does the great democracy of the common-school teaching fraternity.

My topic, "The Rebirth of the Association in 1884," assumes much, but my time limit compels me to address myself briefly to certain great changes in the Association methods, purposes, and work consequent upon that historic meeting, leaving its history to other and more impersonal critics and historians. These changes seemed at the time so important and fundamental that they were at once adopted and have since become permanent in the structure of the great organization.

The first principle of essential value established was the unity and solidarity of the teachers and teaching forces of the United States. The National Association is a fact as well as a name, binding the educators of all grades and all localities, North, South, East, and West, in one composite body. It may seem to you today a singular state of the educational mind of a generation ago when I tell you that it was then seriously proposed, in view of the meager attendance and apparently small influence of the national body, to abandon the National Education Association, and to form three sectional associations, outside of New England, which had the American Institute of Instruction, then a half-century old. It was thought that the Middle States and New England had such a homogeneity in their history and educational traditions that their educators would rally about the old standards of Horace Mann, Henry Barnard, Francis Wayland, George B. Emerson, and those of earlier but most progressive schools, and make the old Institute their rallying-point.

The second association was to include the states of the Mississippi Valley, with the Western Teachers' College of 1831, of Cincinnati, as the basis of union.

The third educational body was to include all the states south of the Mason and Dixon line.

The fourth was to include the mountain and Pacific states.

As supplementary to this geographical division of the workers, it was proposed to hold, once in three or four years, a union or a national educational congress of the four sectional bodies, in order that the sentiment of unity and solidarity might be preserved.

The Madison meeting set forever at rest the question of sectional jealousies and rivalries, and was as complete a solvent of educational separation as was the Civil War of the doctrine of state secession. The National Education Association became a nation-wide institution in 1884.

The principle of national unity in education as the basis of democratic institutions was most emphatically illustrated and enforced at Madison in the broader scope given to Association work—a principle which has been recognized in expanding measure in all the subsequent history of

the National Education Association. To illustrate: temperance in school education was advocated by Miss Frances E. Willard. The education of the Negro to become a vital factor in the future development of both races was discussed by three Negro advocates of the South, one of whom was Booker T. Washington, who made his maiden education speech at Madison. The Indian was the theme of General S. C. Armstrong, General Pratt, and others. Dr. Alexander Graham Bell opened the great question of the training of the defective classes by an able symposium on the education of deaf mutes. "Education in the Southland" was presented ably and eloquently by Dr. Bingham and Dr. Mayo, "Citizenship, the Great Asset of American Education," by Dr. Curry, general agent of the Peabody Fund.

The New Education, then coming to the front, had a distinguished advocate in Colonel Francis W. Parker. These and kindred topics lifted the Association out of the ruts of conventionalism and sent it along the highway of human thought and progress.

Perhaps the most marked feature of broader and clearer educational vision at Madison was seen in an educational exposition in the state capitol, under the direction of Dr. James H. Smart of Indiana, the first and only exhibit ever made by the Association, arranged under five departments.

I. Industrial and Technical Education.
II. State Exhibits of Common-School Work.
III. Art.
IV. Special Exhibits, as Ward's Museum of Rochester, etc.
V. Kindergarten.

Dr. William T. Harris, chairman of committees, reporting on the exposition as a whole, wrote:

> In extent and completeness the Madison exhibit challenged comparison with the Centennial educational display at Philadelphia. Expectations tho large were more than realized. The rooms of the display were thronged from the very beginning. One cannot calculate the influence of it for good. The thousands who studied these exhibits went home impressed with the paramount importance of the claims of the new education and with a vivid idea of its appliances. It only remains to say that the exposition was a grand success in all its departments and formed a very important feature in the greatest educational gathering ever held in this country.

For the first time in the history of the Association, the officers and members were confronted with a strange experience in dealing with new financial problems. For twenty-three years, "Debt," "Debt," "Debt," had been the cry of the treasury, and at the last meeting of the Association at Saratoga Springs, a deficit of $1,200 faced the members, only half of which had been wiped out when I took the presidency. Now, at Madison, with debts all paid, the Association had fallen heir to a substantial sum approximating $5,000. Suddenly and by magic the National Education Association was transferred from a condition of poverty and indebtedness to that of independence and bond-holding. Instead of a problem of debt-

paying, the Association faced one of money-investing. Surely here was a new departure, a phase of the New Education most devoutly to be grateful for. Philosophy is good, philosophy with a good bank account is far better. Art and science are essential to progress, but the science of investing earnings and the art of cutting coupons are essentials to life. The fund of $3,000 begun in 1884 has grown in the twenty-eight years to nearly $200,000. So vital is the matter of finance to the National Education Association that I see the necessity of a prompt enlargement of the invested fund to a million dollars, and a campaign for its raising should be begun at this meeting and made a fitting supplement as well as complement of a half-century of work. Such a fund would afford an income sufficient to carry on the great work of the departments and the general Association and relieve the membership of the annual tax of two dollars a year. The expense of attendance at the Association is a sufficient tax on the members, and provision should be made at this meeting for a speedy removal of the two-dollar fee. A capable financial secretary could easily raise the fund of the National Education Association to a million dollars and place it on a sound financial footing. In a great association nothing contributes the elements of independence, loyalty, and progress so completely as an adequate treasury and a good bank account. For the advance of such a measure, "my hat is in the ring."

Dr. William T. Harris, who tho absent in the body is present in spirit and is our great leader still, states in his historical review of the Association and his estimate of the value of forces, that the members in attendance constitute one-half the value of the meetings, in social, educational, and inspirational ways. Prior to 1884, the annual meetings of the National Education Association seldom exceeded three hundred members, and in some cases not half that number. The first meeting recorded an attendance of 43 persons, including two women, who were not allowed membership in those early, barbaric days. By a conservative estimate, more than 7,000 persons participated in the benefits of the Madison meeting—a number considerably in excess of the total attendance of all previous meetings of the National Education Association. Since that date, few have been smaller in numbers, while at the Boston meeting appeared the immense enrollment of 36,000 members—a marvelous figure as to numbers and values. The total attendance since 1884 is estimated at 250,000 while the 23 previous meetings did not exceed 6,000 persons. On the basis of estimated attendance merely, the meetings since 1884 have been forty times greater in potentiality than those preceding, but this is a low estimate, inasmuch as multiples have an increasing kinetic force, in a geometric ratio. It is safe to assume that today the great body of American teachers absent from this meeting are conscious of its convocation, and are consciously or unconsciously moved by the spirits which issue from the national press and are flashed by the wires over this and other lands.

Madison set a new standard of attendance and values and its excelsior spirit still survives in the annual meetings, in increasing values.

One of the most valuable assets of the Association is its business policy, inherited from 1884. Prior to that time the Association was conducted on the *laissez-faire* doctrine, or a "go-as-you-please" policy. Great men or great businesses do not succeed on either of those lines. Organization is the law of development and educators have been slow to recognize the principle. The first move, made in the 1884 campaign, was to secure a state manager in every state in the country. These men and women were the eyes, hands, and feet of the executive in all the important matters relating to each state, such as the distribution of information, awakening interest, enlistment of the press, and all other matters which served the interests of the National Education Association. We called them general managers in 1884. You name them state directors.

The newspaper press of the country was organized under a national press manager. The railroads were under the direction of able railroad managers. I notice that at this meeting the National Education Association is under the management of the railroads. In 1884, the railroads published and distributed about half a million circulars and booklets relating to the meeting and its attractive adjuncts, at a cost to the several lines traversing the great Northwest of about $5,000. Business plans, organization, directive force were first put in active service in 1884. The immense significance of women's work in education was recognized for the first time, in any adequate way, in 1884. Two women were elected as vice-presidents, and six were added to the Board of Counselors, now Directors. The names of twenty-three women educators are recorded as speakers or officers of the National Education Association, and for the first time in the history of this body, a lady teacher presided over one of its most important meetings, in the person of Miss Sarah E. Doyle, of Providence, R.I., to whom the President committed the official gavel, in recognition of the equality of men and women in the educational world, at least—the President himself being a firm believer in the equality of rights of men and women in all departments of the world's work.

Another contribution of 1884 was the splendid social and human side of the program, and the interchange of state-wide, sectional, and national courtesies and fellowships. Not only did the men and women of the East and the West, the North and the South, come into personal relations and acquaintance at Madison, as never before, but the men and women of New England, of the East and the South, saw for the first time the grandeur and nobility of the Central West and the Northwest, the magnificence of the mountain regions, and the unsurpassed beauties and grandeur of the Pacific slope; while, on the other hand, the West sent her sons and daughters to the East to study the historic past of the Old Thirteen, and to sniff the cool vacation breezes of the Atlantic slope. Anglo-Saxon, Celt, Caucasian,

Ethiopian, Indian, Mongolian mingled as brethren in the unifying and race-erasing influence of a high educational idealism, and the elevating power of a great professional enthusiasm. The spirit of Christian democracy ruled the occasion from first to last and partisan politics found no place or part in the affairs of the National Education Association. The President refused a unanimous re-nomination, generously offered by the Committee on Nominations, thru the hands of Dr. William T. Harris, and received with applause by the great convention. It was only after much persuasion that Dr. F. Louis Soldan, the modest but eminent and scholarly superintendent of schools of St. Louis, consented to assume the large responsibilities of the office. Political methods in the selection of the leading officers were not the outcome of the Madison meeting. Personal ambitions and partisan thimble-rigging were silenced in the presence of the great personalities, the great inspirations, and the amazing possibilities made apparent at this historic meeting. Men and women felt the cohesive force of unity in a great cause, and the divisive force of personal ambition was of necessity banished from thought and act. The sublimity of a great cause dwarfed individual conceits, and the presence of the matchless womanhood of Frances E. Willard, May Wright Sewall, and Clara E. Conway, and the grand manhood of Josiah L. Pickard, Emerson E. White, Albert G. Lane, George Howland, John D. Philbrick, J. L. M. Curry, Alexander Graham Bell, and William Torrey Harris made lesser men humble and docile, as are the lesser Alps in the presence of Mont Blanc.

There is another and possibly a still larger consideration that received its great momentum at Madison, proceeding from the new sensation of great strength, both numerical and financial, and that was the spirit and initiative of large plans and undertakings. I have not time to enumerate those launched in 1884 and since, but it is safe to state that the Association came into a realization and possession of its larger self, and a fuller self-consciousness, and, growing out of that enlargement, it has fulfilled the Virgilian adage, *Possunt quia posse videntur*. It is on this principle that all growth and progress proceeds, and the Association will continue its growth so long as it seeks new and larger fields of work, and flinches not in the presence of mountains of labor.

Sidney Lanier, the great poet of the Southland, in "The Psalm of the West," sings of the time when shall—

> Science be known as the sense making love to the All,
> And Love be known as the marriage of man with the All—
> Till Science to knowing the Highest shall lovingly turn,
> Till Art to loving the Highest shall consciously own,
> Till Science to Art, as a man to a woman shall yearn—
> Then Morn! . . . .

This, it seems to me, was the philosophic outcome of the new birth at Madison, the upspringing of a great body of educators to the new visions

of duty, the realization of great tasks to be done, and the consciousness of a new spirit to enter upon the work of doing, and so long as the Association shall hold its ultimate in

far-off Divine events,
Toward which the whole creation moves,

its great mission cannot end. Today, great questions loom up before the seers in the educational watchtowers. On the professional and administrative side, we have the need of a Department of Education in the United States government, side by side with those of Agriculture, State, War, and the Navy, as in France, Germany, and other foreign states. Education must be officially recognized as the force that makes and protects a republic, and is superior to armies and navies. We must demand that talent and training for teaching are not limited by sex lines, and that the rewards of labor are increased by quality, and not by the cut of the garment or the dress of the hair.

The time has fully come, so it seems to me, when our profession shall have a titular recognition in honors and degrees as do other learned bodies. A four-year course of liberal studies in a normal school is certainly the equivalent of a four-year college course, half of which may be devoted to ball and boat. We should give to the normal graduates the titles that labor and scholarship have rightly earned, as do the colleges, and our great fraternity will never come into its own, educationally, socially, financially, morally, until graduating degrees are granted by all first-grade normal schools and colleges.

A word on another point and I am done. In 1884, a committee was appointed to plan for an international council of education, but the council has never materialized. At Boston, in 1910, it was my pleasure to present a new resolution in favor of such a council, and it was unanimously indorsed by this Association. The first meeting of that committee was held today, and the first steps have been taken toward bringing such a council into being—the result of a purpose initiated twenty-eight years ago. It is sincerely hoped that within a twelvemonth there may be held at Washington a congress of representative educators of all civilized nations, to the end of forming a representative council which shall bring into acquaintance and alliance the educational leaders of all lands and tongues.

C. THE IDEALS OF HALF A CENTURY

JACQUES W. REDWAY, F.R.G.S., MOUNT VERNON, N.Y.

I am not quite certain that my conception of an ideal is correct, nor that I can always distinguish between an ideal and a fad. I decline, however, to accept a cold-blooded dictionary definition of the word, and reserve the right to create my own conception, and to apply it to the time and the occasion.

Perhaps the ideal may be a mental concept of a perfect standard, but it is the concept of a standard that one never reaches—like the end of the rainbow it is always a little beyond the grasp. But the rainbow is never anything more than rainbow; on the contrary, the ideal is ever growing and expanding and unfolding as we pursue it, until the mind is lost in the contemplation of its immensity. Signposts of gold mark its bypaths, and its ways are strewn with acres of diamonds.

The unfolding of a true ideal is like the growth of a plant. Today it is a bud, tomorrow its leaves and petals will expand, then comes the seed; and the shell contains the forests of a thousand centuries. Or we may liken it to the water that comes from a patch of summer cloud. Like a thought descending from heaven, the drops let loose from the mists above fall upon the earth. They gather into rills and brooks until, at last, they grow into a resistless flood that may bear on its bosom all the world's battleships. But the true ideal is never reached; for it is the distilled idea that is conceived of activity and born of everlasting progress.

In his vision of the New Jerusalem, St. John pictured what seemed to him an ideal; but St. John's vision must have rubbed against earthly cobwebs and dust before reaching his eyes. We have grown so tremendously in twenty centuries that a municipal art commission would condemn its lack of concinnity in design, and the health board would close its portals until a modern sewer system should be installed. The accepted ideal of today is the rejected of tomorrow.

In the New Commandment which our great Master and Teacher gave us, we have perhaps the best example of a true ideal—that of conduct in life. It was uttered in less than a score of words, yet out of it has grown all that is good in civilization; and out of it have grown all those blessed attributes which we sum up in the Fatherhood of God and the brotherhood of man. It is the ideal of growth in knowledge, growth in grace, and growth in wisdom. And the root of it all is growth. One may reach the limits of an imperfect standard, but the true ideal has no limits of expansion, save those of the human mind.

My task at this time is to set forth the educational ideals of the past half-century. If it is to be a relation of the ideals for which this Association has actively battled, then the task is easy; it has actively fostered none. It has issued manifestoes of principles, it is true; but it has actively stood for but few; and they, alas, have sometimes fallen stillborn. The Association has been an open forum for every new idea in education, and this must be placed to its everlasting credit; but its support has almost always been passive. For want of an effective organization it has been too often a plaything in the hands of demagogues, rather than a force to be felt in education. Educational adventurers have more than once packed its business meetings in order to obtain a little cheap glory, but they have

wrought derision rather than lasting harm. The steam roller may not have grown rusty, but certainly it has broken no foundation stones.

Could a consensus of opinion be expressed by the rank and file of membership, it would probably disclose the fact that the Association has failed to command the influence to be expected of such a representative body. The press has rarely taken it seriously; and school boards, as a rule, have ignored it. Nevertheless, in the management of its affairs, tho there may have been more or less to criticize, there has been much more to commend.

For this state of affairs, its imperfect organization and passive attitude are mainly responsible. Its stamp of approval has been placed on many good things but it has rarely fought in the open for them. At this convention the Association is to be honored by an address from Dr. Harvey W. Wiley, one of the great benefactors of his times. Now, Dr. Wiley stands for an ideal; not only that, he stands in the open and hands out tremendously hard uppercuts for it. And the Association might sit up and listen; instead of inviting Dr. Wiley to lecture us, we should be sending Dr. Wiley and a thousand more like him thruout the land to preach the gospel of genuineness in all that pertains to humanity. The tacit approval of a great principle counts for but little; the world respects us only when we strip and fight for it.

In the first few years of its existence, the Association confined itself very largely to the discussion of the problems of the schoolroom, especially to methods of teaching. One of these, "object-teaching," quickly became a fad. It was a clever bit of advertising on the part of certain venders of school equipment and, after a brief but strenuous existence, it died naturally and easily—killed by ridicule. But out of the ridiculous there grew that which has approached the sublime. The discussion of object-teaching led to investigations concerning the relative value of the Socratic, as compared with the didactic method of instruction. As a result, each was assigned to its proper time and place. And right there came trouble; for before the problems of time and place could be settled, it was necessary to investigate a question in psychology—namely, the growth of the child's mind. That problem likewise was solved for all practical purposes; and when it was solved the whole subject of elementary education was lifted from an empirical to a psychological basis. Let us admit, brethren, that we are not quite firm on our pegs yet, but we have made wonderful strides.

Forty years ago, when the "don't" idea worried us, we used to discuss preventive measures—among them, how to prevent whispering in school. Then we wondered if really it was best to prevent it; finally, we were compelled to own that it wasn't. But out of this has grown the question of self-conduct, and this we must admit is a long stride in the direction of an ideal; it is a very close approach to the ideal of true democracy; for he who controls others must first learn to govern himself.

In the past fifty years the Association has toyed with many old things with new names, and with new things under old names. Psychology has always been with us. As a craft, for more than twenty years, we both misused it and abused it. Finally we discovered that a knowledge of it is a most valuable equipment when the child is made the objective point; for the successful teacher of today is the one who studies the child, mind and body. The "Quincy" method, the Herbartian ideas, and apperception came in time; likewise motivation and the Montessori system were topics whose value was to be proven. We did not need to prove anything; we all admitted that we had used them for years. And the funny part of it is that we had. There was scarcely a new idea in any one, except that each had been organized into a system; and when we put organization and system into a thing we are on the road, if not to an ideal, at least to success.

The Association is responsible for the enrichment of the elementary courses of study and, on the whole, made a pretty bad mess of it. Possibly the various committees in charge of the work thought they perceived visions of an ideal; but what they most likely saw were ghosts of disordered digestion. Somewhere between makers and users of the enriched course there was lost the fine distinction between enrichment and engorgement. A superficial smattering in many subjects and thoroness in none has been one result of the attempt at enrichment. Now, one cannot deny that a proper enrichment of the course of study is a step toward an ideal; but conservative educators have a dim suspicion that we have not yet discovered how to enrich, when to enrich, and where to enrich. When we have learned all this we certainly shall have made an approach to an ideal; we likewise shall have made half a century of progress in a single leap.

The Association has always shown a kindly spirit toward manual training and its kindred subjects, but we have not always borne in mind its ultimate end. For twenty years or more we have done but little more than discuss whether it should be vocational as its end, or merely disciplinary. As a matter of fact, each view is correct. But, brethren of the craft, neither one is the ultimate end, and if we cannot see beyond these issues we would better relegate the subject to the technical schools. As a matter of fact, manual training has two very definite values, neither one of which is strictly disciplinary, nor can it be called vocational: first, it is the application of thought to action; second, it lessens the interval between thought and action. Granted that other values exist, these alone entitle it to a place in the school curriculum.

The Association has tacitly concerned itself with the intellectual equipment of the teacher, but never seriously with the teacher's personality. For about a century we have ignored pretty nearly every other feature in the licensing of teachers except the possession of a certain academic knowledge of questionable value. In the employment of teachers, superintendents and school boards are usually careful about the personality of

the faculty; in licensing them, the state ignores it. As a result we may find within the ranks of the profession about every variety of fitness and unfitness. The method of certification merely rates a certain intellectual equipment in terms per cent. Let me present two extremes:

In a certain city was a principal of extraordinary ability, whom I will designate as *it*. In person, *it* was coarse and vulgar; in character, brutal and vicious; in mind, vile and unclean. Externally *it* possessed a thin veneer of respectability, which quickly disappeared on closer acquaintance. *It* surrounded itself with assistants of similar character. Such attributes of character are more or less contagious, and the school became known for its low moral status. There were attempts to remove the principal, but for a long time they failed thru the influence of a disreputable political heeler. In time, however, *it* ran into the clutches of the police. Now, modern society will tolerate almost any ordinary shortcomings in character, but draws a sharp line in front of the district attorney's office and the jail; and when the doors of the prison closed with *it* on the inside, there was an end to *it*.

Let us turn to a pleasanter picture. Have you ever heard of Jane Andrews? Of course not. Not more than two members of this audience ever heard of her, and they were her neighbors. Who was she? Why, just a plain, sweet woman of beautiful character, an unusual stock of good common-sense, and a wonderful influence over children. She taught a mission school in New York City. She never could have passed a Regents' examination, and none of her pupils were ever entered in Division X, Schedule K, State Education Department.

Jane Andrews began her work at the age of eighteen, and for fifty-eight years lost scarcely a day. Her job was the taming and training of about forty little wild animals gathered from the slums of a great city. And right royally she accomplished her work. A surprisingly large number of her pupils became wholesome and useful men and women. Some of them are grandparents now. But grandparents, parents, and old boys always remained her loyal friends. The door of every city official was open to her, and New York's most famous society leader was her friend and coadjutor. At the age of eighty-two the external form, like a garment that is worn out and ready to be cast aside, was laid to rest. But a character like that of Jane Andrews never dies. It lives in the hearts of those who loved her, and is passed on from generation to generation.

Perhaps Jane Andrews could not have passed the state examinations now required for a teacher's certificate; but is there not something the matter with the law that certifies to the fitness of a modern Frankenstein on the one hand, and excludes a woman having the qualifications possessed by Jane Andrews? Unfortunately the state recognizes only an intellectual equipment; and this sometimes results in giving to the school board a choice between a prig and an academic paralytic. Let it be said to the

everlasting credit of the Association, however, that tho it has taken no stand in the licensing of teachers, it has always stood for the training of them.

One of the most important features of child life in school has but recently come before the Association—namely, a rational medical inspection in schools. After nearly a century of public-school education, we are beginning to realize what we have been told many times. We are beginning to understand that a sound body is quite as requisite in the making of an effective man as is a sound mind. We are waking to the fact that we have no moral right to launch a boy into manhood without both. Still more, it is unreasonable to expect a feeble, abnormal mother to bring healthy and vigorous children into the world, or to nourish them properly thru the period of infancy. It is an incalculable blessing, I say, that the Association is facing this all-important question.

In the city of Mount Vernon the school authorities were compelled by conditions that could no longer be ignored to take the matter in hand. The city's health board, in compliance with statutory laws, had inspected school buildings and school pupils for years. The health-office physicians had performed their work faithfully and conscientiously. The inspection in question was for the purpose of discovering contagious and infectious ailments; practically, it amounted to the abatement of the traveling menageries which from time immemorial have performed upon the external anatomy of school children.

All this time, the city was paying not far from fourteen thousand dollars a year for "carrying the left-overs"—the pupils who failed in examination for promotion. It did not require the services of an expert to learn where the trouble lay; we had learned it by sad experience. Half, or more than half the cases of retardation were due to causes that could have been removed—defective eyesight, defective hearing, defective breathing, defective teeth, adenoid growths, malnutrition, and incipient tuberculosis.

We simply swept all traditions aside and appointed a health staff of our own, consisting of a physician, a nurse, and teachers chosen for the purpose. Their duty is straight to the point—namely, the discovery of the defects of mind and body that interfere with the pupil's progress in school. It costs money, it is true; but for every dollar spent in the work, two will be saved. And aside from all this, one may also view the matter from the standpoint of humanity's sake.

When the patrons of the schools began to understand the merits of its case, oh, how quickly they came to our aid. The children were provided with summer playgrounds and all the land required for children's gardens. It brought to view the necessity of open-air classes, and of classes for exceptional children. The city hospital is about to give us the benefit of its staff of physicians and surgeons, and clinics are to be established for the

exclusive use of school children. Incidentally, one of the first discoveries was that retarded pupils may sometimes get on their feet and walk by taking one or another of the courses in the manual-training schools. I may safely say that in our own case this rational treatment of retarded pupils is certainly a step toward an ideal.

Finally, let me specify three ideals for which the Association has stood in the past, passively but not actively, indirectly but not positively, and timidly rather than fearlessly: first of all is the child, whom we wish to train into ideal manhood; second, the ideal teacher; and last, the ideal training. These, brethren of the craft, are likewise the ideals we must pursue in the half-century to come. I have a dim suspicion that this subject will not be assigned to me at the anniversary of the association fifty years hence, but I sincerely hope and pray that someone present at this convention will have that pleasurable task.

But the work of the Association for the next half-century must be an active and not a passive campaign. Remember, brethren, that the greatest enemy to humanity in all the world is ignorance. This is the force against which we must contend, today and forever. Let us therefore gird on the armor of everlasting righteousness and fight—and then fight some more.

D. THE MONUMENTS: THE ACHIEVEMENTS OF FIFTY YEARS

JAMES M. GREENWOOD, SUPERINTENDENT OF SCHOOLS, KANSAS CITY, MO.

"Behold how great a matter a little fire kindleth."

To T. W. Valentine, a president of the State Teachers' Association of New York, belongs the credit of initiating the movement to establish a national educational association. In conference with Daniel B. Hagar, president of the Massachusetts State Teachers' Association, a call for a convention was agreed upon, and it was prepared by Daniel B. Hagar in 1856. This call was signed by the presidents of nine state teachers' associations, as follows:

T. W. Valentine.....New York	W. Roberts.....Pennsylvania
D. B. Hagar.....Massachusetts	C. Pearse.....Vermont
W. T. Luckey.....Missouri	D. Franklin.....Iowa
J. Tenny.....New Hampshire	A. C. Spicer.....Wisconsin
J. G. May.....Indiana	

In pursuance of this call, a small number of educators, representative in character, assembled in Philadelphia, August 26, 1857. The meeting was called to order by Mr. T. W. Valentine, who explained its purposes; a resolution was adopted to the effect that it was expedient to organize a national teachers' association; a constitution was prepared by a committee appointed for that purpose, and it was submitted and adopted. Zalmon

Richards of Washington, D.C., was elected president, and J. W. Bulkley, New York, secretary. Forty-three members were enrolled; twelve states and the District of Columbia were represented.

These men had a clear vision of what the country needed educationally, and they stood for the general diffusion of knowledge, culture, and power among all the people. They stated the object of the organization as follows: "To elevate the character and advance the interests of the profession of teaching, and to promote the cause of popular education." Upon this creed they organized the National Teachers' Association, which was changed at Cleveland, Ohio, in 1870, to the National Educational Association. With a change in the title, the object of the organization was more specifically designated by the phrase "in the United States," so that it read, when amended: "To raise the character and advance the interests of the profession of teaching, and to promote the cause of popular education in the United States." Thus matters stood for twenty-nine years.

In 1886, the National Educational Association was incorporated under the laws of the District of Columbia, and in 1906, reincorporated under a special act of Congress as the "National Education Association."

In the Act of Incorporation, Section 2, the first sentence is as follows: "That the purpose and object of said corporation shall be to promote the cause of education in the United States." From these extracts no question can be raised as to the object the incorporators had in view. In the interpretation of legal and other important documents, it is a principle universally followed when differences of construction arise, in order to ascertain what precise meaning the authors had in mind when they framed the instrument and submitted it to the judgment of those who in future would be most vitally interested, to interrogate the authors themselves, if living, or to admit the oral testimony of their contemporaries. In this case the documentary evidence is clear, explicit, and conclusive, being the same in form and spirit in 1912 that it was in 1857, namely: "That the purpose and object of said corporation shall be to elevate the character and advance the interests of the profession of teaching, and to promote the cause of education in the United States." It is upon this platform that the educational and financial policy of this corporation has been conducted, and any material departure from these cardinal principles will impair its usefulness and lead to disintegration. Therefore, the future management must be along broad and equitable lines to all sections of this country.

THE ASSOCIATION AS I FIRST SAW IT

Twenty-seven years of the National Educational Association had passed into history before I knew anything personally of its direct management, altho I attended the session held in St. Louis, in August, 1871, more out of curiosity than for any other reason, to see the noted men and women, numbering, perhaps, one hundred and fifty persons, composing that august

body. They were dignified, earnest, thinking men and women, seeking the higher and better things of the mind. The elementary section enrolled seventy-one members; the higher educational section and the normal-school section each had too few to count.

I paid the fee, $1.50, and never missed a meeting, and I heard the ablest in that convention. The big men, as I rated them, were J. P. Wickersham, E. E. White, Eli T. Tappan, J. D. Philbrick, N. A. Calkins, John Hancock, Newton Bateman, J. L. Pickard, James McCosh, Daniel Read, and, just coming into the foreground, William T. Harris and Thomas Davidson.

After a three days' session I went home feeling that I had at least seen in the flesh some of the most prominent educators of our country, little dreaming that in after-years I should be thrown into intimate personal and official relations with some of these men, and later with hundreds of others as worthy and actuated by the same high, noble, and unselfish motives. At the close of this session the "hat was passed" to take up a collection to publish the volume of *Proceedings*—which is the earliest volume I have seen.

Thirteen years elapsed before I attended another session, and this was when the Honorable Thomas W. Bicknell's "Greatest Educational Show on Earth" was held in Madison, Wis., July, 1884. One cold Saturday forenoon during the winter of 1883–84, there rushed into my office a large, well-dressed man, wearing a high silk hat, and an elegant blue-caped overcoat. He spoke in a stentorian voice, saying: "I am Mr. Thomas W. Bicknell, Boston, Mass., editor of the *New England Journal of Education*, president of the National Association. I have been told that you are a live man, and I want you to read a paper before the Association next July at Madison. I am traveling at my own expense, with the exception of a little clerk hire, working up a general interest in the cause of education thruout our entire country. When do the Sunday schools meet tomorrow? I want to speak about ten minutes at each one, and tell your Sunday-school people who I am, and what I am endeavoring to do. Now, can you supply me with some stationery, as I must write a number of letters?"

Whereupon, we shook hands and I supplied him with what he wanted. He took off his hat, threw off his overcoat, and began writing at a furious rate at my desk. Being half amused, as he dashed off his letters, I made out a list of the leading Protestant churches in the city, and the hours when the Sunday schools were held, and handed it to him. I learned later that the Honorable Thomas W. Bicknell spoke at a dozen or more churches that forenoon. The superintendents of the Sunday schools wondered thereat, and when I told them how he introduced himself to me, it appeared that he used practically the same speech to each of them.

Just here I will say that it took such a man to arouse the latent educational thought of the entire country, and he was the man for the occasion and for the hour. The Association had always been in debt, and it was simply vegetating from year to year when he took hold of the helm.

THE NATIONAL COUNCIL

As the National Council, organized in 1880, sprang out of the National Educational Association, and as a legitimate branch of it, a survey of both is here necessary—namely, of the National Council as such, and of the management and the financial policy of the general Educational Association itself.

In this body it has never been the intention to settle any educational questions by a vote. A topic was presented by a member who had been chosen for that purpose. He read his thesis, and then took his seat in the center of the room, ready to defend his contention against all who differed from him. It was not the thought to have an audience; however, spectators, if there were seats, were not excluded. The primary object of this body was investigation and deliberation.

It was at the Madison meeting in 1884 that I sat for the first time as a spectator in the National Council and listened to the discussions. A colored principal of Kansas City, W. W. Yates, accompanied me. We sat and listened for an hour or more to a discussion on school hygiene. Dr. Emerson E. White was presiding, and Mr. George P. Brown was reporting the discussion. The discussion dragged at one time. Mr. Yates wanted to speak, and not knowing that members only were privileged to speak, he arose without an invitation, addressed the chair, and thereupon proceeded to present his views. Being a Negro, he spoke five minutes without interruption, to the no little astonishment of the members of the Council, and the great amusement of the few spectators present. For many years the Council was limited to sixty members till at the Cleveland session, in 1908, the membership was doubled.

Beginning with the session of 1884, I have been present at all of the meetings of the National Educational Association, except two; and for twenty-two years I have been familiar with the inside workings of both organizations and known what their unwritten history is, and know what the leading educators have endeavored to accomplish with untiring zeal.

Both organizations are strictly democratic in the broadest representative sense under law, composed in the beginning of persons of strong convictions and steadiness of purpose in promoting sound pedagogical theory and practice.

It was the thought of the founders of the Council that its members should, thru committees and otherwise, submit papers and reports on all kinds of educational questions, and upon these the widest latitude of expert opinions should be sought for, expressed, and published. In the selection of members, the dominant idea was to choose persons who should work in determining aims and principles of education by starting from fixed points, and proceed to examine critically old and new educational problems.

To sum up briefly, those who organized the National Council of Education believed that earnestness in seeking after truth is an indispensable

requisite for finding it, and that modesty, patience, caution, and a broad and liberal training are necessary qualifications for enabling one, not only to reason correctly on his own reasoning, but to bring men and women to higher planes of thinking—to understand relations and laws and their force in determining the right in all matters of thought and action.

There was an unwritten law, also, that any person who sought to become a member of the Council was not wanted. Membership sought the individual, and not otherwise. No member of the Council since its organization ever announced his candidacy in that body. It is not a political body, and it is not patterned after political methods, or conducted as a political machine.

THE GENERAL ASSOCIATION—ITS EARLY POVERTY

It was a common thing for members as late as 1884 to advance cash to publish the volume of *Proceedings*. William E. Sheldon of Massachusetts paid $229.97, and Eli T. Tappan of Ohio, $250, on account of the publication of the volume of 1882. Quite a number of persons became life members by paying $20, and a few, life directors by paying $100, in order to fill a depleted treasury.

At the St. Paul meeting in 1890 I was elected treasurer and this brought me into close official relations with the officers and members of the Association thruout the entire country.

Since its organization in 1857, till July, 1910, the high ideals set by its founders, "To elevate the character and advance the interests of the profession of teaching, and to promote the cause of popular education in the United States," had never been departed from in the least particular. Thru all the years of adversity and the later ones of prosperity, the same principles of choosing officers for the National Education Association that now obtain in the National Council had prevailed, and no one ever, except at the Asbury Park session, came forward as an avowed candidate for the presidency of the Association, or for any position. Those who founded the Association and their successors had different objects in view from that of vote-trading and "office-getting." Prior to 1910, with the exception previously mentioned, organized efforts in advance by candidates to capture offices in the Association were unknown.

For one, I hope that the temporary deviation from the great purpose of the organization will soon pass away.

THE PERMANENT FUND AND THE RAIDERS

As soon as this fund was of sufficient size to attract the eyes of the covetous, all kinds of schemes were devised to get hold of it and dissipate it. A person in the East proposed to collect the names of all the teachers and school officials and their addresses, and turn this list over to the Board of Trustees to circularize them, for which the promoter asked the modest

sum of twenty-five thousand dollars for his share of the work. Dr. Calkins and Superintendent Lane referred the proposition to me. It died without a burial. This promoter soon became insolvent, and filed a voluntary petition in bankruptcy. Furthermore the deponent saith not.

Dr. Calkins and Superintendent Lane were both modest men, and while we were associated as a committee, or as an advisory board, I was selected by them to watch the treasury—not a thankful or popular task.

After a beginning had been made, and the Association was more than meeting expenses, and some money could be set aside each year to carry on such investigations as appeared to be necessary along educational lines, the accumulated surplus was transferred to the Permanent Fund. This has been and still is the general policy. This fund was to be added to until the interest arising therefrom with the annual membership dues should be adequate to meet the current expenses, and to carry forward the legitimate work of the corporation. It was a policy definitely outlined by Dr. Calkins, Albert Lane, Edwin Hewett, W. E. Sheldon, Aaron Gove, James A. Canfield, F. Louis Soldan, E. O. Lyte, J. M. Green, Nathan Schaeffer, L. D. Harvey, Nicholas Murray Butler, I. C. McNeill, Irwin Shepard, and the writer. This was a simple business proposition that has been pursued for the purpose of putting the organization on a solid and permanent financial footing in order to carry forward the work that ought to be done. The Permanent Fund is at this time $190,000, with a surplus of over $3,000 awaiting investment.

THE DAYS OF THE SCHEMERS NOT ENDED

For years nearly all the business details have been conducted by the ex-presidents of the Association. As chairman of the Committee on Investigations and Appropriations, I have had exceptional opportunities of receiving communications and listening to those who had discovered (but were unappreciated) the most wonderful and helpful things for the uplifting of the teaching force, and, incidentally, the youth of the country. Had an educational curiosity shop been established by the National Educational Association since 1895, it would contain more real specimens of great wants come to a premature end than any other intellectual museum in the world. There has been afforded an excellent opportunity to observe certain minds wandering among stars, guided by one lightning-bug flash. While many of these sought to do things seldom wise and never important, yet there have been others whose proposals contained far-reaching ideas, and whose investigations have been real contributions to the cause of education.

THE ANNUAL VOLUME OF PROCEEDINGS

In 1893, the writer proposed the appointment of an Editorial and Revision Committee to edit all papers except those of foreign delegates, and thus reduce the size of the volumes by eliminating in any paper what has been previously discussed by some other person. This would avoid

repetition by making references to former papers. As it is, each writer, unless he happens to have access to previous volumes, oftentimes writes on subjects that have been threshed over many times. I am still of the opinion that the proposition then advocated has merit in it, and that it would be a move in the right direction to have an Editorial and Revision Committee.

CONCLUSION

My life was but slightly connected with any of the founders of the Association. Daniel B. Hagar I met at two or three meetings of the Association, and once only I saw Professor William T. Luckey, both signers of the original call in 1856. Zalmon Richards, the first president, was a constant attendant till only a few years ago. Coming on the stage in 1884, I have known quite intimately every prominent man or woman that has been a member of the Association from that date to the present. These persons have stood for the highest and best things of the mind and heart in our civilization, and I indulge the hope that the educators of the present and future will follow their example.

When I pass in mental review the illustrious names in scholarship, culture, and other higher qualities—those who added grace and dignity to this great movement—I cannot refrain from mentioning the name of the one who has since 1893 been the great organizing power in this corporation —I mean Dr. Irwin Shepard, one of the most remarkable men among a galaxy of notable men and women of this country. To his clearsightedness, keen business sagacity, tact, and skill in conducting and handling the railroad and other transportation interests, mastery of details, and the organization of the educators in each state into a compact body of progressive men and women, the marvelous success of the Association is due. The historian of the Association will do full justice to him whose brain has planned and whose hand has executed the great work committed to his care for the past twenty years.

E. THE COMING HALF-CENTURY

ELLEN C. SABIN, PRESIDENT OF MILWAUKEE-DOWNER COLLEGE, MILWAUKEE, WIS.

You have heard the story of the past: of the original inspiration of this organization; of its renascence; of the high ideals and the noble achievements of fifty years. There have flashed before you beloved names

> with lofty passion fraught
> Such as make battles won
> On fields of Marathon.

To speak adequately of its future would require the prophet-bard, the poet-seer, the sibyl who should lift the veil and read the hidden word. A mighty ode should at once close this cycle and inspire the coming era.

But it is only the past and its legacy of the tendencies of the present that constitute the horoscope for our prediction. The glass is dim as we peer thru the lens of the future. Who can interpret the contradictory indications? Who can thru the nebulae make sure of the controlling centers?

The past revolutionary years have taught us to set no limit to the progress of the world in any direction. So far are we from skepticism that the wildest chimeras receive attention. The impossible is merely the not-yet-demonstrated. The achievements of the past have left us receptive to new revelations. Progress is the word of the day. The Magi's star, Plato's dream, the poet's vision, all utopias have been transcended before our eyes. Prophecies and ideals have come to pass from Mother Shipton's to Ruskin's and Howells'. Today we stand in alert expectancy. We do not know what we shall see, but a vast unlimited outline is in our conception, and we daily look to see it take form. Reckless would he be who should limit or define the coming half-century.

The underlying thoughts of a period and its resultant movements both affect formal education and are affected by it. Education is at once formative and impressible. While a molding power, it is itself plastic to influence. Therefore general tendencies of thought and life, as well as the obvious educational activities of our time, are in our view. It is our clearest modern seer who teaches us that the fundamental, ruling ideas that a people hold determine its greatness and happiness, or its obscurity and misery.

We recognize that, among such controlling powers, the idea of democracy is the most dominant force in the world today. It influences education in its deepest sources of feeling. It expresses itself in every department of educational activity. Vital, fruitful, it bears many products that are perversions, as well as the choicest fruits of our civilization. It depends upon education to train this luxuriant plant to beauty and beneficence, pruning its excrescences, grafting upon it cognate nobilities, nurturing its essential good until it becomes the perfect tree of the common life, with healing in its every leaf.

And with the true democratic insight into the value of each individual in the mass, there has come to us a new sense of the significance of the whole. We can, therefore, gladly see "the individual wither and the world grow more and more." This dawning recognition of the glory of humanity, the deepening sense of the importance of the race—is not this one of the sublimest of those thoughts that pierce the night of our ignorance and "urge man's search to vaster issues"?

And thus, reaching beyond the individual to the race, we have found our geographic boundaries extended—annihilated. No spot on the globe is alien to us, as no people is foreign. The sense of unity in interests and destiny makes us international in mind. We have world sympathies and

understandings. Truly, "the diet of our thought has changed." There has, consequently, with democratic ideals, with thought projected down the long line of the race, and with universal scope, developed an immeasurably enlarged conception of the purpose and field of formal education.

As life changes, education changes. The curriculum of our schools today, together with the spirit that pervades them, makes the school a place unrecognizable by some returning Rip Van Winkle of fifty, of twenty-five years ago. A new vocabulary is required to express its ordinary functions. No exposition of our varied interests is more convincing than the program of this convention! We appear to be led by the invincible spirit of progress, and only the brakes of the obdurate inertia of the teacher and the spell of tradition check our forward movement.

Tho colleges and universities have been transformed, the most significant change is observable in the first six years of school life. Here are developing both those disciplines that are most necessary to creditable existence in a highly complex civilization, and those that enrich life, making it worth living.

Under the first demand, besides reading, writing, form, and number, are health-science and art; physical training; play activities, providing for the necessity that exists to experience the exciting, dramatic emotions that free play calls into life; geography; government and civics; training the purchaser to distinguish true worth among many varieties of commodities; euthenics, eugenics.

The second demand includes literature, art, and music; self-expression in all forms, as speaking, writing, dramatic action, and dancing; manual training, the hand developing and expressing ideas, awakening the fine appreciation that only skill can elicit; history which explains the present, helps to account for one's self—"a practical psychology," it has been said—and both determines and discloses the future; first-hand nature-study with appreciations of nature in literature and art. In these manifestations are the auguries of the future, and the coming years will see some of them, as health-science, expanded, some radically changed.

And so we think of aspects of education as cultural, vocational, physical, social; of the training of head, heart, and hand; of mental and moral culture; and we strive to fuse all forms that they may be mutually supportive of the fair, symmetrical edifice we would fain construct.

In the many directions in which the awakened purpose of our day seeks to realize its ideal for humanity thru education, efforts whose harvest the future will gather and whose fan will separate its grain from the chaff, the teacher will continue to be largely the instrument.

There yet remains to be effected the development of the individuality of the child into a distinctive, unique personality, and this requires both living with others and the protection of solitude.

The problem is to be solved of the school efficiently supplementing without usurping the functions of the home.

Thru scientific study and analysis all work is to be standardized, these standards not to be iron weights and prison bars, but helpful guides and impersonal correctors.

So enriched and modified are to be certain leading studies that the cultural and the practical are to be disclosed as opposite sides of the shield, the training of the muscles to skill shown to be cultural, and the liberalized mind to be practical.

An increasingly responsible part is to be performed by the teacher, in addition to the service of the consulting psychologist, in guiding each youth to his proper business, trade, or profession, thus aiding him judiciously to enter an occupation that offers both self-realization and social benefit. With the years there must come to those who would be teachers of youth something more of what we "aspire to be and are not," some greatness to enable them to be equal to yet higher tasks than the present imposes.

Eucken has said that a proud self-consciousness and independence of youth is one of the notes of modern humanity. It is ours to meet this high spirit, not to fear, to abhor, or suppress it, but to lead it forth beyond its self-assertion and revolts, past its license and lawlessness into the "perfect liberty" of disciplined affections and ordered wills. What a challenge to guide a young generation devoid of superstition, unafraid, and daring into reverence and obedience! What may we not hope in far-reaching reforms when minds ingenuous, unwarped by prejudices, meet the compelling force of the great laws of Nature and the persuasions of the great Scriptures?

There must be established, or re-established, the connection between knowledge and responsibility for right conduct. Duty and obligation must be related to daily life. The inspiration to noble living must be imparted whether life is to be with Marcus Aurelius in a palace or with Epictetus in servitude. Loyalty, now so often dangerously diverted to group, society, or party, must give its allegiance to right principles. Noble dreams of youth, now so often the cynic's jest, must be so fortified that they will abide thruout life. We may not further tolerate the monstrous divorce of intellect from conscience, but instead make all training tend to clear perception of the right and love for it. So shall issue from our institutions of learning the "calm observer of ought and must."

The coming decades inspire us, believers in liberty and justice, with great hope of better homes and schools as we think of two generations of our race who will be reared under the influence of women who will have experienced larger opportunity than has ever before been known to woman. With education better adapted to woman's needs, and her increased opportunity to improve the conditions of human living, may we not reasonably

believe that we are on the verge of the fulfillment of Tennyson's inspired prophecy: "Then springs the crowning race of human kind"?

The splendid function of this Association, in the future as in the past, must be to organize into constantly increasing effectiveness the educational leadership of this nation. It will make great investigations, intensive and extensive, revealing to us definitely our own status and bringing to us the world's experience. It will hasten the coming of the national university, and promote national organizations that shall increase our privileges and bring the benefits of research to the humblest school.

With opulence of wisdom, it will deduce laws, interpret conditions, direct and prescribe with such assurance as the limitations of human insight will allow. While meeting ever-new social and industrial conditions, adapting content and method to constantly altered demands, it will be steadfast to its immutable purpose to preserve to their highest uses the inestimably precious hours of youth. It must be polestar and compass, chart and helm.

With all its definite and professional responsibilities, it will meet its peculiar opportunity to conserve the great ideas by which our race can live. This Association will be a bulwark to preserve the threatened faith in democracy. It will constitute a valiant army to restore the imperative of duty to its violated throne. It will

> rest in faith
> That man's perfection is the crowning flower
> Toward which the sap in life's great tree
> Is pressing—seen in puny blossoms now
> But in the world's great morrows to expand
> With broadest petal and with deepest glow.

As our forefathers stood on the beach before their great venture and heard the words: "The Lord has more truth yet to break forth: be ready to receive whatever truth shall be made known to you," so this Association, on the threshold of a future unknown but assuredly great, expecting an effulgence of truth that shall make our present seem darkness, hears the poet's adjuration: "Light the young!" Thus shall we

> save them forever
> Who shall save the world.

TOPIC: THE AMERICAN HIGH SCHOOL

A. ITS RELATION TO THE SCHOOLS BELOW

WALTER R. SIDERS, SUPERINTENDENT OF SCHOOLS, POCATELLO, IDAHO

In attempting to understand these relations it is essential to look to the origin of these two schools.

Our high school has its beginnings in the Latin grammar schools, which were first organized in Boston in 1635. The purpose of the Latin grammar school was

the preparation of the boys for the university in order that the colony might be aided in securing a body of learned men who, by acquaintance with the ancient tongues, should be able to obtain a knowledge of the Scriptures and qualified to discover the true sense and meaning of the original.

The sole aim of this school was to prepare for the ministry. Due to several causes, chief among which was the gradual separation of things religious from the state, these Latin grammar schools declined in number and influence, despite the laws enacted to perpetuate them. A new type of school arose, which, in addition to being a college preparatory school, met the demands for a practical education. For fully a century this academy was the chief source of secondary education. It was superseded by the public high school in the first quarter of the nineteenth century.

The modern high school has combined the best features of the former Latin grammar school, and of its successor, the academy. High-school courses have been broadened and liberalized until there is now no necessary conflict between preparation for life and preparation for college. The school makes social efficiency possible while encouraging and pointing the road to culture.

The elementary schools have passed thru a somewhat similar course of development altho developing independently of the Latin grammar schools and of the academies.

In 1682, writing and ciphering schools were established in Boston, giving public recognition to the value of some education for the practical affairs of life, and to the importance of providing for all who wished such training.

Almost contemporaneously with the decline of the Latin grammar schools and the rise of the academies, the curriculum of the elementary school gradually enlarged to include reading, grammar, and geography. The writing and ciphering master being unqualified to teach the new branches, a new man, called the grammar master, was secured to teach the newly adopted subjects. This system continued in force in Boston from 1740 to 1847.

In addition to this elementary school there were elementary schools connected with the academies, which elementary schools were termed the pre-academic department. The work of the academy was grouped into departments; as, first primary, second primary, intermediate, grammar, academic, and collegiate departments. Each of these departments included two or three years of work. The entire course was planned to begin at the eighth or ninth year, and to occupy a training period up to the eighteenth or twentieth year. In this way the school course came to be ten or twelve years in length and the academic or secondary course to have two, three, or four years, based on a pre-academic course of eight or nine years.

The elementary schools and the secondary schools were brought together in the middle of the last century. Their development had been

separate for a century and a half, and altho now united for nearly a century, their relationship is nominal rather than organic and real—united as by a marriage bond rather than by blood relationships springing from common origin.

Many attempts have been made to articulate the work of the grades with the high school, but the irreconcilable facts have been that the high school is broadly cultural while the elementary school is narrowly cultural and mechanical. The elementary school is largely a means to an end, the secondary school sees the attainment of many of these ends.

The end of the elementary school is not knowledge. It is rather to organize the instincts and impulses of children into working interests and tools. Attention is to methods of mental attitude and operation rather than results measured in memory. Dewey asserts the need of the development of

> a certain active interest in truth and its allies, a certain disposition to inquiry, together with a command of the tools that make it effective, and the organization of certain modes of activity in observation, construction, expression, and reflection.

While the mind of the child should be nourished upon a course of study comprising an orderly presentation of the field of knowledge in its elements, the special aim should be to provide an opportunity for the exercise of all his powers, mental, moral, æsthetic, and constructive—thru good instruction and wise discipline—and to promote the health and development of his physical being.

What is secondary education? Former United States Commissioner of Education Elmer E. Brown says the purpose of secondary education is

> to raise all subjects which it touches to the plane of science by bringing all into the point of view of organizing principles.

Hanus thinks:

> The secondary school should especially promote the discovery and development of each pupil's dominant interests and powers; and should seek to render these interests and powers subservient to life's serious purposes, and should make possible the participation in the refined pleasures of life. The serious purposes of life are, first, self-support, or, when this is unnecessary, some worthy form of service; second, intelligent, active participation in human affairs. The refined pleasures of life are found in the ability to participate with intelligence and appreciation in the intellectual and æsthetic interests of cultivated men.

The contrast then between elementary and secondary education is that elementary education is given to the organization of the instincts and impulses of children into working interests and tools, while secondary education has as its end and aim trained individuality, which trained individuality recognizes its obligations to and dependency upon other members of the social group.

Lest it be thought that no recognition is here given to the fact that the elementary school is the finishing school of the masses, let it be observed

that, whether the student purposes to prepare or to finish in the elementary school, the ends of the elementary school do not materially change. The presentation of the whole field of knowledge in its elements and the training of all the powers—mental, moral, æsthetic, and constructive—will cover a finishing or a future purpose. Vocational aims to be realized in the elementary school or to be realized in the future determine the stress of attention to be placed upon the cultivation of a given power.

Because of satisfaction with the existing order of things the purposes of neither the elementary nor of the secondary schools have been fully realized. All agree that they yet remain to be harmonized.

Not until recently has attention been given to individual aptitudes and capacities. The course of study and the school organization were based on the assumption that children were normal, on the supposition that all had the same latent powers and talents, and that it only required education to draw out and to bring these powers to a high standard of proficiency. The theory seems to have been accepted that pupils did not come thru school alike because a sufficiently hard pull had not been put upon some of the latent potentialities. Of late, there is a suspicion that some powers are latent to the vanishing-point, and undoubted evidence exists of power plus in certain faculties of the bright child.

The provisions now made for the subnormal and supernormal as well as for the normal child, the shortening of the promotional period, and the introduction of group systems mark a distinct educational advance in individualistic treatment.

An increasing dissatisfaction with the inharmonious relations of elementary and high schools, together with an appreciation that neither school was accomplishing what it should, has brought about many reforms in the past twenty years. The report of the Committee of Ten in 1893 for the first time set a national standard for the high school. It demanded many important reforms—the most significant in connection with the subject of this paper being the extension of certain well-recognized secondary-school subjects down into the elementary grades, the departmentalizing of some work below the high school, and a closer articulation of the elementary and the high school.

The report had a wide influence, but the conviction has gained ground that complete reform can come only with a complete reorganization of the school system. In 1905, the National Education Association appointed a standing committee on a six-year course of study for high schools. A six-year course for the elementary and a six-year course for the high school is believed by many to be a solution for the vexed questions of the interrelations of the two schools.

The public school is, as Calvin Olin Davis says in *High School Education*,

subject to indictment by the grand jury of public opinion on the following points: (1) the curriculum is overcrowded; (2) there are duplication and waste in administration; (3)

there is little correlation of subject-matter; (4) exaggerated attention is given to unessential and impracticable topics; (5) many topics now presented have no legitimate place in any curriculum; (6) pupils are overworked; (7) the course of study is inflexible; (8) there is no close articulation of the elementary with the high school; (9) individual tastes and capacities are not rightly considered; (10) promotions are based upon an unsound principle; (11) discipline is unsuited to the stage of development of the pupil; (12) teachers are improperly equipped; (13) pupils are influenced by too few different personalities; (14) methods of instruction are unpedagogical; (15) the study of many secondary subjects is postponed beyond the proper time for their best presentation; (16) work is not effectively vocational; (17) enormously large numbers withdraw from school; (18) insufficient attention is paid to the retarded pupil and to those of superior ability; (19) there is not sufficient handwork; (20) specific trade instruction is lacking; (21) the whole system is over-mechanized. . . . . This bill of indictment is being examined point by point and a true bill is being found.

While some of these unsatisfactory conditions are found thruout the entire system, and some in elementary or high school alone, the great majority of them apply to the seventh and eighth grades. Here is where reform is most seriously needed. It is believed that the rearrangement of the work and of the administration of the seventh and eighth grades, and the readjustment of the other grades to the new plan, would do away with most of the evils and inconsistencies with which we are now confronted.

The demanded readjustment has given rise to the idea of dividing the present twelve-year course at the sixth instead of at the eighth grade. Six years are thought to be sufficient to do the work demanded of the elementary student, and it is thought that the seventh and eighth grades should assume the character of the high school and adopt its forms and methods. It is difficult to show that the aim of the seventh and eighth grades differs in any essential from that of secondary instruction. Progress from the sixth to the seventh, or from the seventh to the eighth, should mark an increase of mental power. If the work in these grades is poorly arranged, or if these grades are wrongly administered, it may be expected that the student will find his school work lifeless, tiresome, and aimless. Compulsory education may keep him in school, but it cannot interest him. The student is present, but not participating.

Puberty is either close at hand, or already a vital factor, changing the pupil's physical make-up and mental characteristics, altering his life-interests, and widening his horizon. The student wants to put away childish things, he wants recognition of the fact that he is entitled to the *toga virilis*, together with all increased considerations of his personality attendant thereupon.

A change of administration will be demanded if secondary education is to begin with the seventh grade. Dr. Davis in the work above cited states:

There are four distinct methods of organization and administration that may be employed. Each offers unique advantages. Each lends itself to adoption *in toto*, or in combination with the essential elements of each of the others. These four methods are:

1. Continue the external form of the school as it is today, but introduce into the seventh and eighth grades the principles now obtaining in the administration of the high school. This would leave the elementary school outwardly in much the same condition as today. A modified form of departmental teaching would be provided, an enriched curriculum, a closer approach to the idea of student responsibility, and a better promotional system.

2. Bring the seventh and eighth grades into the high-school building and organize and administer all work above the sixth grade as a unit, both respecting external form and internal operation. This plan merely takes the seventh and eighth grades out of their present setting and merges them with the present high school. They thereby are brought fully under the principles dominating in secondary education. Departmental teaching, limited election of studies, scientific methods of instruction, a freer spirit of regulation and control, all are henceforth to be the birthright of the seventh- and eighth-grade students as they are at present of the pupils of the four upper grades.

3. Make a complete differentiation of schools and of subject-matter from the very beginning of the seventh grade. This plan implies a differentiation in aim, in subject-matter, and in buildings at the very outset. From the sixth grade the ways diverge. All work beyond this is organized in separate and distinct schools by themselves. In its complete organization, there will be seven distinct types of schools, the number varying with local conditions. These several general types are: (*a*) college-preparatory school; (*b*) manual-training school; (*c*) high school of practical arts for girls; (*d*) high school of commerce; (*e*) the business school; (*f*) the trade school for boys; (g) the trade school for girls.

4. Group the seventh, eighth, and ninth grades by themselves as a junior high school; and the tenth, eleventh, and twelfth grades by themselves as a senior high school. This method is adaptable to large cities where separate buildings and separate control may be had.

No attempt to study the relations of the high school to the grades below could be considered as touching the subject did it not analyze the various life-purposes of pupils and from these purposes determine the needs of pupils in both elementary and high schools, did it not determine the progressiveness of these needs thruout the grades, and did it not consider the stimulus and inspiration which courses answering the pupil's needs will have in his retention in school. Too often the only stimulus the high school exerts upon the grades below is the influence of its athletic achievements, or the inducements of its social life; but by answering a positive need the high school will exert a wider and deeper influence all down thru the grades.

With regard to their futures there seem to be five groups of pupils: (1) Those who will leave school at the end of the compulsory age and go at once into the world's work. Should the high school reach down to include the seventh and eighth grades it can offer in addition to the standard instruction: general industrial work for boys; general industrial work for girls; trades instruction for boys; and trades instruction for girls. These pupils are the large group in all schools, and it is not to the credit of our educational systems that they are the most neglected. (2) Those who will go one or two years beyond the grade of compulsory attendance, but will not complete the entire course. For these there should be the short courses enabling them to begin at the sixth year and prepare themselves for clerks, stenographers, and secretaries. There should be a choice of a short course in the

vocational and trades work fitting the recipient for various employments as an artisan. (3) Those who can complete high school but who must enter vocational life as soon as they have finished. For such there should be commercial, engineering, agricultural, manual arts, and household arts courses. (4) Those whose circumstances make it possible for them to select a vocation after leaving high school, yet who have not the means to go to college; these should have a general course covering many fields of learning, but demanding concentration on one or two lines of study. (5) Those who have the abilities, the desire, and the means to go to college. For these the college-preparatory course should be offered which should be of sufficient scope to prepare the student for such college courses as his future vocation will demand.[1]

In this reorganization of seventh and eighth grades, what subject-matter ought to be included? Most authorities agree upon: (1) English; (2) history, civics, and geography; (3) ethics and sociology; (4) physiology and hygiene; (5) arithmetic, elements of algebra, and geometry; (6) elementary science; (7) manual training, or domestic science and arts; (8) music and fine arts; (9) drawing; (10) voice culture, public speaking, and dramatics; (11) physical training.

What shall determine promotion to high school, whether at sixth or eighth grade? The promotion should be based on the consideration of the pupil's increased mental power and growth as determining his ability to do advanced work. It should not be based on knowledge tests alone. Knowledge can be tested by requiring the pupil to supply the data upon which he is to show his powers or to display his abilities. When a pupil shows sufficient power in the school arts to demonstrate that these arts are usable tools for higher education, he should be passed on. Not only should the pupil's knowledge structure be tested, but also the accuracy, facility, and rapidity of all mechanical processes based upon that knowledge. Promotional examinations to the high school are often pernicious in the stress laid upon testing memory instead of power. The stress put upon promotional examinations to the high school, attendant upon the eighth-grade commencement exercises, leads many pupils to feel satisfied with their attainments—pupils who would continue in school but for this emphasis on the final elementary grade.

Many small school systems are top-heavy in that they carry more high-school work, put more teachers in the high school, and have a greater per capita secondary expense than the elementary-school conditions warrant. The high school should not be built up at the expense of needed grade instruction. Educational sentiment should discourage this practice, otherwise the matter should be so regulated by law that the elementary school cannot be made to suffer in order that a display may be made at the top of the school system.

[1] Adapted from Charles H. Johnston, *High School Education.*

Pupil-advisers—teachers delegated to a guardianship of certain pupils' studies and progress—is not a new idea. But a great gain would accrue to pupils of the beginning high-school grades should such pupil-advisers take the former grammar-grade teachers into their counsels to learn the pupil's aptitudes, his abilities, and his weaknesses—but not his shortcomings. Let the rogues' gallery be kept from our public schools.

Altho not strictly germane to this subject, the amount of time spent in school is tangental to, and makes an appeal for, inclusion. Is not our school year too short? Would not a longer school year with shorter vacations be more rational? Considering the various new activities of the school, playgrounds and recreation centers, and manual instruction as well as mental, ought not the school week to include six days instead of five? For the same considerations, ought not the school day to be longer and with more varied activities? The school year in Germany has forty-five or forty-six weeks; the school week has six days; four school days have at least six hours, and two days have from three to four hours. Their school year totals fifteen hundred hours; our year is about ten hundred hours. Their total gain fs about five hundred hours. Are not outside influences threatening American education, and cannot we best counteract such influences by living more with the pupils?

In summing up some advantages to be derived from the new relations here discussed between grades and high school there ought to be noted that the six-year program according to its leading advocates

(1) Would put the seventh- and the eighth-grade pupils under one corps of teachers with a unity of purpose. (2) The seventh- and eighth-grade pupils would be on the way to a new goal before adolescence is complete. (3) High-school teachers would then understand why ninth-grade pupils are "numbskulls," mental vacuums, and dreamers of dreams. They would understand that the pupils are undergoing a physical change, and that their condition is not due to the stupidity of former grammar-grade teachers. (4) School arts could be carried on into higher grades with profit. (5) The first six years could be given to the acquisition of, and to proficiency in, the school arts. The seventh and eighth grades could get more culture work while learning the school arts, thereby making the transition between eighth and ninth grades a gradual one. (6) Secondary subjects could be studied continuously for six years. Culture in the fundamental subjects could be started earlier and continued thruout the high-school grades.

B. MORTALITY IN THE EARLY YEARS: SOME ADMINISTRATIVE REMEDIES

ADELAIDE STEELE BAYLOR, ASSISTANT STATE SUPERINTENDENT OF PUBLIC INSTRUCTION, INDIANAPOLIS, IND.

The fact of mortality in the early years of the high school is so old and so well established that no proof of it is necessary. The small percentage of high-school pupils who complete the course has been a matter of newspaper comment and general public agitation. Some years ago when the

rate of mortality was much higher than now, the elementary school was held to be responsible. Pupils entered the high school unprepared in the fundamentals; they could not read, write, spell, add, subtract, multiply, and divide, and the high school, it was declared, could do nothing under those circumstances. So the elementary schools were regarded as the stumbling-block and vigorous and profitable measures were taken to vitalize the courses there, to make more complete the articulation between the elementary schools and the high schools, and in this way to reduce the mortality.

Departmental work was introduced into the elementary schools extending down almost to the primary grades. Latin, algebra, and other subjects, hitherto accepted as belonging wholly to the secondary curriculum, were projected into the grades. High-school methods in organization, athletics, and other lines were pushed downward, but still mortality, not only in the early years, but in all years, prevailed.

Then educators began to look above for the cause, and the teachers of the elementary schools could breathe an air of relief as the colleges and universities came in for their share of the burden. They were demanding certain set formal courses of study for admission and the high school must conform. Its curriculum had been fashioned to suit the college and university—so many pages of Latin, a certain amount of history, so many pieces of literature, and so much mathematics must be done, apparently by all, before the very, very small percentage of pupils who desired to continue their work in these higher institutions of learning would be permitted to do so. Thus college and university domination has been accepted as the cause of mortality in the secondary schools and the "professors" have been called upon to give an account of their stewardship.

The first movement was productive of good, for when the elementary schools went back from the extreme of high-school domination, as many of them have, and began to look to the pupils and their needs, they found many good things had been accomplished. Departmental work passed to its proper place in the highest grades of the elementary schools, in some instances working out with great profit to the young people the junior high school. High-school subjects were not retained with high-school methods, but where they persisted, it was because of a vital connection with the education of the children and the courses of study, in the hands of skillful teachers, in the elementary schools.

In this study of the weaknesses of elementary-school pupils, the curriculum was modified to introduce music, drawing, manual training, and domestic science, as a concrete side to reading, writing, and arithmetic. Children passed into the high school with more power to think and to do, and the rate of mortality was necessarily diminished.

The critical observation of the college and university in its application to secondary schools is too young for us to see positive results, but there is

every assurance that it will do good to both institutions and that again the rate of mortality will be lessened. Already the movement has brought out the valuable report of the National Education Association Committee on the Articulation of Secondary Schools and Colleges, in which a course of study is suggested that admits of larger latitude in the election of subjects, and its authoritative origin will encourage state and local officials to broaden their courses of study, at least sufficiently to conform to this report. One state board, and possibly more, following the general plan of this report, has already modified the course for its commissioned high schools, so it is possible for pupils to graduate from these schools without higher mathematics or foreign languages, tho not without both. However, the state board has made the wise reservation of allowing certain substitutions only under their supervision, when they are assured that the school has equipment and ample teaching force to do the substitute work successfully.

No doubt there will be weaknesses and many misunderstandings and misconceptions in this attempt to remedy what we have been pleased to call college and university domination of high schools, but it will help all, by calling attention to the courses of study long pursued by the higher institutions of learning and vitalizing them, as well as by improving the work of the secondary school, and again lessening the mortality.

But with this profitable agitation concerning the nature and work of the institutions from which the high school receives all its students and to which it sends a portion of its students, is there not another line of critical examination that might be more profitable than either of these in lessening the mortality in the early years, i.e., that of the character and work of the secondary school itself?

Does it serve any other purpose than that of a connecting link between the elementary school and the college, and if it does, is the purpose large enough to justify an expenditure of money and energy to bring about its fulfillment?

Do boys and girls at the most critical period of their lives need careful and close supervision and instruction to assist them in understanding their own needs and possibilities, their own capacity, and their own relations to life itself, no matter what their future work may be?

If people need a special institution for guidance and instruction from childhood to adolescence and young men and women need a special institution for guidance and instruction beyond adolescence, is there not greater need for a special institution for guidance and instruction during the intermediate years? It seems to me there can be but one answer to these questions and that an affirmative one.

There is no period perhaps in the lives of the boy and girl when the home has so little influence as at this particular time. Self-conscious, with new interests, new methods, new aspirations, an independence without judgment, a critical attitude toward what has hitherto been accepted

without question, these young people feel an extreme reluctance to submit to adult authority. They want to become leaders, organizers, dictators, members of special groups. Surely for such a transitional stage, the soundest, surest, safest, and strongest institution should be provided, and that institution the American high school.

What are some things, then, that are needed to make this high school justify the purpose for which society supports it? In the first place, its legality and the sources of its support should never be questioned. In every state in the Union there should be definite legislative enactment that recognizes the high school. As a necessary part of our great school system? Yes—but *more than that*, an institution in which is provided adequate building facilities, equipment, courses of study, teaching force, for every boy and girl of high-school age in this country, regardless of race, color, or previous condition of servitude; and furthermore, regardless of whether his future will find him in a college, a university, an office, or a workshop. It should be what it purports to be, the American high school open to all who rap at its doors for admission, and able to interest, instruct, and provide for all thru the continuance of certain well-defined purposeful courses of study and work, under mature and competent advisers and directors.

With a legal existence everywhere and definite funds for its support, the first thing necessary for the preservation of those who enter an American high school is the faculty. There can be no compromises here. Mature, experienced men and women, with scholarship and training, must constitute the faculty. If the mature, experienced teacher cannot be found with the college and university degree, take a few without. A high-school faculty is more in need today of people who have rubbed up against life in some practical way than of those possessed of degrees, but it is always in need of both, and the largest returns will come when both scholarship and life-experience are found in the same teacher.

This faculty must co-operate for the cause not only of every pupil in the high school, but of the community life. The Freshmen must be put in charge of its most able members; if any pupils must suffer because of weak points in the teaching force, let it be above, not below. In these early years, the pupils must be handled in small groups and so far as possible their methods of study and general lines of conduct must be directed by the faculty.

I think Woodrow Wilson, whom the Democratic party has just distinguished by a nomination to the highest office of honor and trust in this country, was the first to introduce into his institution a plan whereby certain members of the faculty were given the personal care of and responsibility for certain groups of students—a provision that every American high school should practice.

Salaries must be paid these men and women sufficient to secure a far greater degree of permanency in a community; and there should be com-

mittees among them whose specific business it is to study and report on every line of activity in the community, and how the high school can adapt itself to these special needs.

There must also be committees of the faculty to acquaint themselves with the home conditions of every child in the Freshman class, and ascertain sympathetically the attitude of the parents toward the work, the purpose for which they are sending their children into the secondary schools, and, in turn, acquaint the parents with the purposes and plans of the school. Public gala days that bring parents to the school for a little while will not answer. The school must be taken into the home.

High-school teachers' meetings should be called, not to discuss methods of teaching, but to talk about community life and spirit; not to discuss failures, but to present plans to retain boys and girls in the high school.

In this reaching-out into community life and the home, we will find that high-school pupils are accomplishing things outside the curriculum that may be recognized and taken into account, and that we may co-operate with factories, business men, and those in professional life, for the good of these young people. There are some things in the education of boys and girls that may be done better outside the schools and should be recognized in the schools.

Thru all this work, motives will be supplied for continuance in school, for, as the outside world becomes a part of the school life, placed there and administered by experienced persons, the young people of the high schools will not be forced to seek it at so early an age in a strange and unguarded companionship.

This same individual study of pupils, their home, community life, by competent and able teachers, will lead to the necessary and proper modifications of the curriculum, which is another important factor in the prevention of mortality in the early years. It will not be modified because some high school in a foreign land, or elsewhere, has done so, but because it must be made inviting and supply motives for the young people who enter the secondary school to take it up and pursue it. Vocational work of all kinds will always be a wonderful incentive if rightly understood and taught. Commercial subjects, manual training, domestic science, agriculture, and other industrial lines growing out of community needs and applied to community life will be essential, but these subjects can be made as stale and unprofitable as Latin, mathematics, or any subject of the curriculum. They are indeed fads when they are attached by school authorities who say: "We don't see much use in them, but there seems to be a demand that they go into the schools and we must keep up with the modern movement." But by this close contact with the pupils and their home life, this understanding of the community, the high-school faculty will vitalize the curriculum and exterminate all matter that might be denominated either "fads" or "effete."

Literary, dramatic, forensic, and athletic organizations that many times have been so ruthlessly thrust into the high schools to satisfy the restlessness of these young people will be conducted on straight and proper lines, because of the close relations and sympathy between pupil and teacher, and competitive affairs with other schools, if observed, will be straight and regular, with a willingness to accept defeat rather than a compromising victory. More things will be written and told about what the high school is, rather than what it should be, and the surprising number of pupils who remain thru all courses, rather than the mortality, will be the wonder. College and university men, always ready to accept the students who can do things, will open their doors gladly to receive applicants from the American high school, regardless of the course of study they pursued.

The old principle of the "survival of the fittest," under which we undertook to excuse the mortality in the high school, has been supplanted by the newer and better one of social service, social helpfulness, social value. Writers on secondary schools are approaching their subject from this standpoint and it is that basis, and that alone, on which the American high school can be preserved. The schoolmaster is not the dictator, but the servant, of the people. He is employed to follow out, not the whim or caprice of a few particular individuals, who want the schools fashioned after their own desires, but the general demands that spring from social and community sentiment. For the preservation of the youth in the American high school we must look down and up, but far more continuously must we look out and modify our work to suit the broader and more vital needs of society.

The maximum of success and the minimum of mortality can come only when the high school is recognized as an institution that is essentially American, and therefore maintained to do the greatest good to the greatest number in a great republic; a portion of an educational plan that, while it must be dependent to a large extent for its best results on the character of the instruction in the grades below it, and the influence of the institutions above it, yet whose curricula and plans of organization must be controlled by the demands of life and be sufficiently flexible to be adapted to community needs; an institution whose teachers must do more than simply equip themselves in scholarship, to give to boys and girls who have had an elementary education an insight into their own abilities and needs with the power of initiative in thought and action; a part of our school system that deals with young people at a very critical period in their lives when the parental influence should be strongest and most effective instead of uncertain and frequently impotent; an institution that calls for careful, sane consideration of its special needs in relation to itself and its student life and not in relation to some other high school in some other land or some other community; and finally, a part of a great social whole, that will always be affected by the general principles that control the larger unit, one of which is that change and new adjustments are essential to life.

C. THE SPECIALIZED OR VOCATIONAL VS. THE COMPOSITE HIGH SCHOOL

ARTHUR DEERIN CALL, DISTRICT SUPERINTENDENT OF SCHOOLS, HARTFORD, CONN.

Compared with the Latin schools of our earlier time, schools typified by the Boston Latin School antedating Harvard College by a year, by the Penn Charter starting before the close of the seventeenth century, our secondary schools of today represent a long wholesome advance in American thought and practice. These very pioneer schools, and their like, represent in themselves a rich and sane evolution. Our secondary educational system, like our other human institutions, is not perfect, but I have little patience with most of the indiscriminate destructive criticism of our public high schools. They have done, they are doing, they will continue to do a great service toward the promotion of the ideal at the basis of our democracy.

And after all, is it not by this standard that we must measure the results which we think we accomplish in our educational endeavor, this standard of the ideal behind our democracy? That is to say, does our system provide a full and free opportunity for every youth of whatever section or station to make the most of himself, to promote his own enjoyment in the service of the common weal? This, I take it, is the great aim of all public service: to provide the freest possible opportunity for each to work out his own happiness in the service of an advancing democracy. Any adequate discussion of an educational problem, it would seem, must start and end in this proposition.

Of course there is a difficulty involved in the word "opportunity" as used in this relation. "Opportunity" for what in detail? And how best is this "opportunity" to be provided?

It will probably be granted that our high schools, like our colleges, have overemphasized a bit their duties to a selected few. No one person is to blame for this, no one set of persons. It has grown largely out of a general haziness in the minds of most of us about culture, and a dense darkness regarding the specific needs of society. We have seen clearly that doctors, lawyers, clergymen, teachers must be provided. So, drawing upon the rich stores of the ancient world for most of our models, we found a way to manufacture these desirable persons fairly well, at least to the a bit complaisant satisfaction of the doctors, lawyers, clergymen, teachers. We forgot, or ignored if we remembered, that only 4 per cent of our population are professionally engaged. Or, if we knew the facts, we assumed rather *a fortiori* that the training which worked so well for the professionally inclined was the best possible preparation for all. Our great lawgiver, the General Emeritus in our educational army—Charles Eliot—still fervently contends that the best preparation for life is to prepare for college.

Now this theory has worked. Let us confess to the truth. It has worked impressively in important instances. We must tread softly here, for you and I are flowers of this very system. It should not be surprising, therefore, when we find opponents to innovators in this sacred field.

And yet we are awakening to newer connotations in the word "opportunity." We can agree with Great Britain's distinguished Professor Murray that a "deep decay has eaten into the study of classics in America," and thank him sincerely for recognizing the truth which we all consciously or unconsciously feel, that "the time has come which demands a deeper and more solid—and therefore, a slower—education. Great insurgent forces are at work in the United States and citizenship will require in the future a finer training and vision than in the past." In short, there is a wide area of genuine loyalty to the culture of the old school. This is quite true, and hopefully true.

We can also see, however, that the so-called "practical sense" of our people is very strong. The demand for a short, cheap, effective training to meet the demands of the field, shop, conveyance, trade, home, is a real demand. Given a demand, we are disposed in America to meet it. Hence the high schools, determining never to give up all that made glorious the past, are struggling to do their share to meet the practical situation in a practical way, to meet the need of the 36 per cent of our population engaged in agriculture, the 24 per cent in manufacturing industries, the 10 per cent in trade and transportation, and the 20 per cent in domestic arts, as well as those of the 5 per cent in our high schools who go to college. And so, as an outgrowth of our efforts to interpret more widely the significance of the word "opportunity" in these latter days, we witness the growth of agricultural, industrial, commercial, and domestic art courses on a wondrously increasing scale. We explain to ourselves that these serious, tho often ineffective, attempts aim to do for the industrial what we have been doing so long, and, for the most part so well, for the professional workers.

Granted that the high school must continue to meet both the old and the new demand, one immediate question to be answered is: Where shall these two lines of educational activity be carried on? To be precise, shall we have separate, special schools with a vocational bent for the practical courses, or shall we combine all secondary activities in one composite plant, albeit the courses be kept distinct? Thus our question is one principally of organization.

There are arguments on both sides. Indeed, both systems have been pretty thoroly tried in various and differing centers of our land. When I was asked to prepare this study, I at once settled upon certain fundamental theses—theses, I confess, springing from a pathetically limited first-hand experience in such matters, a large amount of a priori speculation, and the hypnotic suggestions from a few men whom I greatly respect. The theses were:

1. The tendency toward specialized high schools has gone too far in some quarters.
2. Economy requires less speed in this direction.
3. There should be less duplication of plant, laboratories, and the like.
4. Pupils should not be asked to go so far to reach the "special" schools.
5. Many facilities are now practically forbidden a large number of students because of the inaccessibility of the "special" schools.
6. The "special" school removes pupils from the "composite" school, hinders the promotion of democracy, and tends to promote class feeling, etc.

These theses have given me some interesting experiences. I found, for example, that they meet with enthusiastic support from the small cities, and with a rather generous disapproval from the large cities. In trying to analyze the reason for this divergency among the doctors, the conclusion seems justifiable that the large cities, being more directly interested because more acutely in need of industrial schools, and having the resources with which to act, have proceeded along the one shortest and most practical way and begun their experiments with the special schools. These schools are usually centrally located, launched with industrial fervor, but of very little significance, I believe, so far as real vocational training is concerned. Of course this last is not true of the trade school, but it is true of the industrial work in high schools. Officers of the large cities grant that most of the theses are true for small cities. I venture the question, If they are true for a small unit, are they not also true for a large city which is but a series of small units? So, at least for the purpose of this paper, let us forbear separating the problem into large and small city phases.

ARGUMENTS FOR THE SPECIAL INDUSTRIAL SCHOOL WITH A VOCATIONAL BENT

The arguments which I have been able to find urged in favor of the separate industrial school may be briefly enumerated as follows: It permits the economical concentration of equipment, avoiding unnecessary duplication. It permits of the concentration of the teaching force, enabling the work to be done with fewer instructors. It permits the concentration of individuality in the work, such as enabling the school to fit the English to the industrial pursuit rather than to preparation for college. The administrators of the regular high schools have not proved to be willing or competent to administer successfully effective industrial courses. From some sources I gather that the separate industrial school produces better results. One superintendent from a large city writes:

> The kind of work that is effective in industry or in business is not possible in a composite school. For this there are many reasons. First, it is impossible, unless the administrator in the building knows the field, and that almost never happens, because principals are chosen according to traditional ideals. Second, the efficient vocational school is possible only when the academical and vocational studies are correlated or dovetailed together. The student who is taking a business course needs a different kind of English in part and in practice from that one who is headed for college. Third, the effective vocational school has an entity of its own, for it must establish a bureau connecting with

those who employ the product. These seem impossible in a composite school. The fact is that it is impossible to secure the results in a composite school that are possible in a separate school.

The commissioner of education in Massachusetts believes

that the vocational school must be something set apart; that a vocational school must have its equipment, location, etc., determined by the conditions of the vocation for which it prepares; that a commercial high school and a high school for machinists should not be in the same building and cannot interchange equipment.

He urges that

a school for tailors would not use the same equipment as a school for carpenters and a school for carpenters would use little of the same equipment as that used in a school for machinists.

In general, Dr. Snedden doubts the element of validity in what might be called "general vocational training." He grants that every general or liberal high school should have opportunities for manual training for boys and household arts for girls, but that these should be simply a part of the program of general education, and that we should not deceive ourselves into thinking of it as "vocational." The composite high school is rarely going to give, in his estimation, vocational training.

And yet Dr. Snedden agrees to the objections against supporting different "classes of pupils," and "that it would be ideal if we could have all of our schools together." He says:

There is of course, not the slightest reason why several vocational departments should not be on the same block with the general high school. There would be some economy in giving such studies as English. On the other hand, most of those who discuss this sort of organization are not thinking of vocational education at all, but of some two-hour-a-day scheme of shop training, which, as my experience indicates, is of little value for purposes of vocational education. . . . . The question of the location of the vocational school is an important one. It will probably have to find its location in the neighborhood where the industry for which preparation is being made is carried on. It is the feeling of the business men of Boston that the High School of Commerce should be located in the heart of the commercial district, altho reasons of economy have hitherto prevented that consummation.

There is a sense in which we must agree with Commissioner Snedden's feeling, "that this question cannot be adequately discussed until we have made up our minds as to what we mean by the 'vocational school.'"

ARGUMENTS FOR THE COMPOSITE HIGH SCHOOL

The arguments in favor of the composite high school, or, as it is variously called, the cosmopolitan high school, the general high school, or the university high school, may be briefly summarized as follows: It promotes economy by permitting the use of the same heating plant, janitor service, study halls, social service rooms, and various types of equipment. There is no reason why the pupils in all courses should not use the same library, auditorium, gymnasium, lunchroom. There is no reason why all the schools should not have the same supply-room and be run by the

same business manager. An argument which has often been overlooked, but a very important argument in favor of the composite high school, is that, because of its accessibility and all-round equipment, it lends itself more readily to the use of the evening schools with their varying demands. The composite high school provides articulated courses which enable children to change easily from one course to another. The composite high school presents various life-preparing opportunities, and for this reason is more attractive to boys and girls, promoting a larger high-school population and a longer attendance. The composite high school promotes democracy among the pupils and among the teachers, avoiding cleavage into classes and the unpleasant results which come from caste distinctions. Another reason for rearing schools of the composite type is that the aims, in the last analysis, of the two types of schools are practically indistinguishable.

In presenting my theses to the various leaders in typical cities of our country, I received replies producing a profound hopelessness in my mind of getting any real assistance from those who are best able to advise. The leaders, even in the large cities, are not wholly in agreement about these theses. The comfortable thing about this is, however, doctors disagreeing, that we are at liberty to say some things which we ourselves evolve out of our own inner consciousness. At this stage of my mental undevelopment, I am convinced, first, that boys and girls do not usually follow those vocational lines that are preferred by them at the time of entrance into the special high school. Second, I am inclined to the belief that the high-school teachers are able to detect special abilities and to promote nascent tendencies as the pupils go thru the high-school course, and that such abilities and tendencies are made manifest more readily in the composite high school. Third, as one connected with the United States Bureau of Education, Dr. C. D. Kingsley, writes:

> About three years ago, while a teacher in the Manual Training High School, Brooklyn, I made a study of the geographical distribution of high-school students in that borough. We had six high schools, only one of which offered manual training. We found that the Brooklyn high-school students were regularly paying over $100,000 a year for carfare in order to reach the schools of their choice. The Manual Training High School draws to itself a very high proportion of the boys and girls on the park slope, Brooklyn, and draws students who desire manual training from the entire borough. Many of these students have to spend three-quarters of an hour or more upon the cars, both morning and evening, adding to the overcrowding of the cars in the morning, and spending, to reach our school alone, in the neighborhood of $25,000 or $30,000 a year. When you remember that many of these are young girls about fourteen years of age, and that all of them are spending time on the street cars that should be spent in walking and getting benefits of the fresh air, you can see how serious a matter it is. The carfare item is a serious drain upon the income of many of the families that find it a difficulty, at best, to keep their children in school.

To this, Superintendent Maxwell replies that it is "no objection," that "education is too cheaply and easily obtained." Another adds laconically: "Maybe it is better to go farther than to get a 'gold brick' near by."

In St. Louis, they have four white, and one colored high school, in all of which the same courses are offered. All have an equipment of shops, laboratories, and libraries varying only to meet the needs of the number of students in each school. The quality of the teaching corps in all of the schools is the same; thus the opportunities offered to a pupil in one high school are identical with those in the other high schools. The city is divided into four districts for white children, who are required to attend the high school in whose district they live. Thus the secondary system in St. Louis is based upon the principle of the composite high school, offering all opportunities for secondary education to all pupils. They believe that this is preferable to a system of specialized high schools, and emphasize the importance of promoting democratic ideas thru acquaintance and saner judgments which this system encourages. They have worked out with considerable detail the principles involved in the theses which I offer. Philadelphia has just moved a long way in this direction. Toledo is just completing two new composite high schools, each with a capacity of about 1,200; each of the I-shaped type, the central portion to be devoted to academical work and the wings to industrial laboratories, fully equipped. Other cities leaning strongly toward the composite high school are: Minneapolis, Portland, Ore., St. Paul, Rochester, Pittsburgh, Denver, Chicago, Milwaukee, Cincinnati.

CONCLUSION

There are great unsolved, but essential things which industrial education must provide and promote, such as the favorable admission of pupils to the industries, more practical experience as wage-earners, co-operation between the school and shop, industrial efficiency developing thru definite steps to definite occupations, that personal power most locally demanded, recognition by the colleges of high-school work in household economics and mechanic arts, reverence for our social institutions, as the courts, the law, the government, the church, the school, the home, the continuance of the educational process as far as possible, applied scholarship, a purposeful life.

Assuming that education must provide and promote these things, we have to grant that our educational system must meet the needs of those large sections of our population outside the so-called professions. In carrying out this program, we have come to grant that the whole of the pupil must be led to function, body, mind, and spirit; that we must cast our teaching more nearly in the terms of real life, motivizing as well as idealizing, vitalizing and energizing as well as intellectualizing and moralizing. Thus granting the importance of the aims of the older schools, we are finding a widening place for industrial education. Granting that the language, history, and number facts accumulated and being accumulated

must be preserved, and for the most part in our old-line schools, yet we are practically a unit now in insisting that industrial training must be likewise provided to meet the practical demands of our industrial life. Industrial courses have therefore become our fixed and accepted policy. Indeed, we are beginning to find that these two types of training are not of that ultimate difference which we at first supposed. We insist now that there is no industrial education worthy the name which does not end in a richer life of culture, and that there is no cultural education worthy the name which does not end in practical service.

But we have not, in our practice, been able to fashion a single course of education equally adaptable to both types of schools. So we separate the courses, roughly, into cultural, academical, scientific, classical, and industrial. In the organization of schools for the promotion of the best in our democracy, I believe in the composite high school, with courses leading to college, normal school, commercial training for boys and girls, domestic science for girls, manual and mechanical training for boys, each of these departments separate and under the direction of an expert, but all under one head.

So I am convinced after all that my tentative theses are in the main sound, namely, that there should probably be fewer specialized high schools, and pretty certainly that more attention should be given to developing composite high schools in various parts of urban centers, as the need may arise.

It is true that high-school pupils are problems in themselves. They are not to be treated according to a psychology of adults. There is no set organized psychology of childhood or adolescence. The teacher's most practical help is concrete interpreting experience, with real boys and girls. Human development means more than the acquisition of knowledge—it is a growth from within. The teacher's vital concern is to remove the obstacles from the way and to provide for those reactions which best promote this growth, representing the whole child in distinction from the body, mind, spirit, memory, feeling, or will of him taken separately. Different periods of child development present different demands upon the teacher's resources, but the demand in all periods is for a closer transition from the school to practical life, and that the child's activities shall spring primarily from his own past and be a generous expression of himself. Better physical bases, closer relation to vocations, and a greater harmony between school and real life are the most hopeful educational tendencies toward our democratic ideal of personal opportunity for all in a progressive society. I believe that the type of high school best qualified to promote education in the light of these principles is the composite high school.

D. SOCIAL ORGANIZATION IN THE HIGH SCHOOL

MILTON C. POTTER, SUPERINTENDENT OF SCHOOLS,
ST. PAUL, MINN.

There is surely no adjective so vaguely used or variously defined as the word "social." For its splendid generic sense the pedagogical pundits of our times delight to use it. But some use it in a specific restrictive sense, and often on the same page put it into violent antithesis with itself.

A great wholesome meaning for society is, all companionable people—those who serve their fellows. Social categories must differ—from philanthropist to paperhanger. But to be considered social any category should be embracing, not exclusive, but inclusive. The anti-social sediment is called the criminal class. The anti-social scum so often called society in various communities let me call the snobulous. Its members are not always necessarily snobbish, but consciously or unconsciously they exercise a toxic influence which all except the snobulous recognize as violently unsocial.

I am asked to discuss social organization, not snobulous organizations, in the high school. The latter have done their little worst to make ridiculous their juvenile initiates together with their fond and foolish parents. Our high-school corridors have almost ceased the breeding of snobs, and now seldom serve as the favorite promenade for the display of mystic jewelry and the sickly but ludicrous imitation of a college boy's strut.

The condemnation of secret social clubs in high schools by teachers, parents, and courts of law where appealed to, is practically unanimous. Greek letteritis brought forth a harvest of weeds and wild oats. We need not thresh that old straw here. It is history. But the assumption that organized manifestations of sociability among high-school students are evil *per se* is not unlike certain rather common American attitudes toward various adult activities like lodges or churches or camp-meetings. It is so easy on the brain and so satisfying to the conscience just to tag the whole thing "very bad" and then govern yourself accordingly. After that, one has no occasion to perplex oneself with annoying distinctions within the category upon which one has long ago put a definite tag. That is a clever arrangement for a lazy man with a large conscience.

But such a man should not be called too particular, by which word he is sometimes described. Far from it! His generalizations are often so sweeping and so cocksure as to pain and bewilder a really particular person.

> Said Deacon Ephraim Josiah McCotton:
> "All dances in Hell are begotten."
> Said Dick to Miss Bly,
> "Never mind the old guy;
> To the pure almost everything's rotten."

Now your normal healthy high-school boy is sure to "do some marvelous doings." And it won't help him any for us to swamp him in our moral

and polite generalizations. I think that much of our trouble in high-school management comes from being terribly shocked at some things which boys do as unconsciously as they carry their hands in their trousers pockets. To assist in organizing a boy's social activity will make him a conscious social being. A policy of repression will make him a puppet or a reckless rebel.

Two or three years ago Principal Lasher, of the Erasmus Hall High School in Brooklyn, N.Y., before the Department of Secondary Education, and Principal Johnson, of the Chicago University High School, in the *School Review*, described, at considerable length, numerous examples of student organization in their schools. Indeed, they handled the subject of fraternity substitutes in rather detailed fashion, which relieves me from doing so.

It appears from correspondence with several high-school principals, and from my own experience, that the strongest voluntary organizations in the high school are usually for one sex only. Partial segregation of the sexes, as practiced in the Cleveland Technical High School for instance, seems to furnish a broad basic condition for healthful social organization of a student body. Some years ago Dr. G. Stanley Hall said that segregation is always in some degree necessary for full and complete development, and to avoid a settled eviration of the boys. "There is a little charm and bloom rubbed off the ideal of girlhood by close contact, and boyhood seems less ideal to girls at close range."

There is considerable authority indicating the desirability of at least partial sex segregation above the eighth grade, such as:

1. Jordan, David Starr, *Higher Education of Women.* 1902.
2. Woods, Alice, *Co-education.* 1903.
3. Chambers, Will Grant, *Evolution of Ideals.* 1903.
4. Hall, *Adolescence*, Vol. II, chap. xvii, pp. 561–647.
5. *Co-education in the United States and Foreign Countries.*
6. Münsterberg, Hugo, *Psychology and the Teacher*, pp. 306–7.
7. "Co-education," *Baltimore School Board Journal*, October, 1911, p. 27.
8. Gove, Aaron, "Co-education in High Schools," *National Education Association Proceedings.* 1903.
9. Small, Albion W., "Co-education in the University of Chicago," *National Education Association Proceedings.* 1903.
10. Harper, William Rainey, *Decennial Report.* 1903.
11. *Riverside Report on Segregation.*

Partial sex segregation in many high schools is slowly growing merely as a convenience in program organization. The coming of the high-school shop, kitchen, and gymnasium has polarized the young people as to these subjects and has necessitated the segregation of boys and girls in some other classes in order to make feasible their segregation in these.

Further, the tendency toward sex segregation in adolescence is well illustrated, if not proven, by the spontaneous fraternal organizations

which have naturally developed along sex lines in all high schools where the administration has been too academic or the teachers too indifferent to originate or supervise proper social activities. It seems as tho the boys and girls naturally and unconsciously endeavor to separate themselves in their spontaneous organizations so as to make more formal the occasions of their social intercourse. No one can be blind to certain dangers inherent in that tendency and in those organizations—but no one not blind will fail to see the fact and to reckon with the good that is in it, when assisting students in organizing their clubs and societies.

We are the administrative agents of a new institution. The twentieth-century high school presents totally new features and problems to the executive.

Yesterdecade the high-school teacher just out of normal or high school engaged herself almost exclusively in keeping up with the bright pupils in book-learning and in finishing the last pages, if possible, a little ahead of the class. Today your boy is lucky if he gets two or three teachers whose excessive erudition does not forbid their remaining within calling distance of his cries for help. The former teacher was a business competitor of the "clever scholars," as was each "scholar" of every other. The recent type tends to form alleged high-school "faculties" with a school life distinct from that of the "student body." Meanwhile the need for social leavening grows greater.

The membership has changed. With high-school enrollment increasing from three to four times as fast as the total population in the past two decades in forty cities examined, a more varied membership is discovered than formerly. By the same token, the demand for effective mixing processes grows imperative.

The place of the high school in popular thought is changing. Today nearly every citizen is a loyal constituent of our "peculiar institution." No legislators or governors are today discussing the familiar nineteenth-century question, "Should the people be taxed for the education of the few above the common school?" This public faith in us imposes upon us the public duty of socializing the unsocial.

The high-school functions are changing. From having been purely a collegiate preparatory school for a very few, entertaining within its gates sundry ambitious "district-school teachers" in the making, and various others who were not old enough, or well enough, to do something more worth while, it is rapidly becoming a receiving-station and motivating agency for the final output of the common schools, which makes desirable the introduction of natural acquaintance opportunities in the very first year of high school.

A committee of representative mothers phrased it this way a few weeks ago:

The first year of the high school discourages most of our children. In the last year of the grades they are coaxed and loved to a hothouse rapidity of growth. Then suddenly they are plunged into a chilling atmosphere of tutorial indifference which causes most of them within the year to stay away from the great, new, cold, strange school. High-school teachers and first-year children should meet oftener outside of recitations or study.

A school official put the other side like this:

No right-minded people approve of school parties. It is hard to conceive of a dance in a public-school building which is not a public dance. The proper school relation is a business relation, not social or intimate in any way.

One of the strongest and most conscientious high-school principals I ever knew told a boy in my hearing, "You didn't come here to play. School is business." He was wrong on both counts I should say, or at least partly so. The boy did go there to play in all likelihood, and a large leaven of play in his teachers would likely have saved that boy.

A school is no part of the factory age. Difficult as it is to maintain consistent order and at the same time avoid mechanizing the "business" of an overgrown city high school into rather inhuman perfection, there are many great hearts who see and sympathize with the still pitiful baby girl or boy beneath all adolescent vanity or vulgarity.

Only if you call the household activities of a colonial fireside "business" can you so denominate school life. Its business is but one detail. It is more than business. It is art. It is politics. It is love. It is play. It is a cross-section of all life. That is the vision of a modern high school, which warms the hearts of consecrated men and women, and without which the children perish and are found in the thereafter working in laundries or driving laundry wagons.

It is too easy for me to say I am simply a mental mentor to the young. Such a conception of my functions saves me my afternoons and evenings free from their intrusion. But I see across the hall a popular white-haired maiden, upon whom the bloom of age has softly fallen in silver glory, giving every afternoon, and all of it, to the students' affairs; and I wonder. She says that she considers her classroom work the least of her duties, and still more the least of her privileges. She believes that every real teacher in the high school should feel the imperative call of the young upon her afternoon time and should find it practically impossible to get away before the building closing hour, at five o'clock, any day. She is a great teacher. Her kind will before long possess the twentieth-century high school. For the youth of the land carry them in their hearts, and the young people make the schools.

The graduates from such schools do not forget such teachers. They return again and again, carrying gifts of buildings and statues and books, of children's fields and baths, and the frankincense of noble thoughts and kindly feeling. At the afternoon parties (for they are never held at night and never outside the high-school building) there are mothers and fathers

who delight in the children and who help them, in folk games or graceful cotillions, to forget the clod of clay which cumbers the aspiring spirit and to bring it into unconscious co-operation toward the purposes of school life and of all life. Happiness is a habit. Habits are perfected by practice.

Our Puritan educational heritage has given us so much of good that one must regret the necessity of admitting that their theory of life as a "preparation for death" not only shadowed the life of my ancestors but caused their schools to become detached institutions which were not a part of life but merely "preparation for life."

We all know teachers and officials today who hold this limited conception of the school. Such a school is an isolated pool in which the little fishes grow sleek and fat and self-satisfied. Upon a day they are thrown out into the great waters of the life stream to sink or swim or gasp along the shore. They would be more apt to swim, and swim in deep water, if their youth were spent in a bayou, or living tributary of the main stream.

Not only should the commerce department, the apprentice committee, or the vocational committee in any high school keep the adult life of the community in constant touch with the school life; but the social committees will find the same practice invaluable in giving the young people who most need it the proper strength and ease of approach, the unconscious simplicity and poise, which these young ones will find so valuable in the larger life. Fathers and mothers will be found who will give their leisure, or even business hours, for the sake of other people's children as well as their own. Indeed, they now recognize that they cannot corner the social virtues for their own alone. The social graces are ubiquitous. They grow in one by diffusion among many. High-school fraternities were violently unsocial. But they pointed the way to social organization, co-operating with fathers and mothers.

Evidence of abiding life-interest in high-school affairs always delights my heart; but particularly so, if manifested by a Greek-letter convalescent. The writer of the following letter was one. She graduated from the Centennial High School in 1910, shortly after the surrender of all outside charters and an agreement for the future to organize only inside clubs or societies, with Centennial authority, and always including some high-school teacher or teachers.

BELMONT, MASS., May 24, 1912

Mr. Milton C. Potter, Pueblo, Colo.

MY DEAR MR. POTTER: I am going to write you a long letter. You want to know about this school, I know. I have been for some time in Belmont, Mass. Belmont is one of the numerous small towns close to Boston. My uncle is the superintendent of schools here. Thru his efforts an organization was formed known as the "Belmont High School Athletic Club." I am sure you will be interested in knowing about this, and I want to tell you what I can of the movement.

The high school owned no athletic field, and no ball ground was accessible. In the course of a few months after the formation of the high-school club, Mr. Underwood,

a prominent man of the town, noticed the lack of athletic fields and equipment. Altho he had no children, and could not profit directly thru it, he gave to the high school a large field to be used for athletics only. The boys were at once interested and began work grading the fields. At present they have a "gridiron," a baseball diamond, tennis and croquet courts, and a fine running-track.

The field is about a mile from the schoolhouse, and a mile is too far to walk in football togs, and so the boys decided that they should have a clubhouse. Again Mr. Underwood became interested. The services of an architect were secured. The architect planned for a small clubhouse, built in Swiss chalet style. When the plans were accepted they were turned over to the Manual Arts Department. The work from this time on was done by the boys. Master plumbers, masons, an carpenters were engaged to show the boys how to work. The interior is finished with panels and beams. The panels are hand carved, as also are the porch supports. The huge fireplace has a pair of andirons of iron, representing a claw holding a football. The boys made these in the forge-room. The curtains and pillows were made by the girls in the sewing classes. The boys made all the furniture.

The clubhouse is not large. It has an entrance hall and clubroom, and is well equipped with baths, showers, and dressing-rooms.

The "Athletic Club House" is the pride of the high school. Each student feels a personal interest in it, and it is pointed out to strangers as one of the landmarks, almost rivaling Bunker Hill in importance.

Sincerely yours,

ESTHER LEONE HUNT

In the new high school nearly every teacher spends nearly every afternoon in some sort of extra-classroom activity. A strong student's volunteer weekly schedule might look something like this:

Mondays:	Euterpean Society (or some other musical club)
Tuesdays:	Cinderella Club (or some other dramatic club)
Wednesdays:	The Smithy (or some other crafts club)
Thursdays:	The Pnyx (or some other debating club)
Fridays:	The Duck Party (or some other party. In one western college town the young people call the high-school classes "Oneies, Ducks, Trips, and Quads," splendidly ignoring the college phraseology.)

The dear young scamps in the high schools are bound to do some scampering. It's our business to keep up with them and make the scampering count for something. Our young people are quite willing not to ape the adult four hundred if something more worth while is presented. With their final recovery from the imitative languors and silly vices of the grand society women and young men of the new rich, our boys and girls must come into their rightful heritage of noisy joy and merry work in the spirit of play.

For all of these occasions the young people will do their own decorating and serving and subsequent housecleaning. I know this is not impossible for I saw the third-year girls in a St. Paul high school eagerly grasping at the chance to wait upon the graduating class at their last banquet. Indeed the waiters in the café of this high school are all of them high-school girls of the very finest type, who receive nothing whatever, not even food, in return for their splendid service. Those young ladies are many of them from

very affluent homes. All of them, the brightest and the slowest, the richest and the poorest, are the instruments and the beneficiaries of a fundamental social education. But it is not hard to shut your eyes and see the shocked face of some dear mama of the μμμ variety as she indignantly exclaims: "No one shall ever make a daughter of mine do such a thing."

Just so, dear lady. No one in the new high school would ever attempt it.

But the cleansing waters of unselfish service flow most freely for boys in the games of the field and gymnasium. Manners are a fine art, considered as a way of living. Literature and history are a manual of manners. However, few boys will take a grandfather's advice, or profit from his experience. Therefore, literature and history unapplied do not suffice. First-hand condensed social experience is had on the athletic field. Athletics is a moral life-laboratory.

Everywhere in America some kindly lady with a mission in life must needs arise and view with alarm the "brutalizing effects of the dangerous games still criminally countenanced by high-school authorities." But the vigorous sports of youth, now properly supervised and co-operated in by the teachers, still cleanse the blood and tone the will, subdue the temper, and string up the attentive powers of the finest boys in the English world. Still they stand the most persuasive life-influence, the most appealing school memory, and the most powerful guaranty of social democracy in all our high schools. Because of them there is hope that the American boy of tomorrow may keep his boyish simplicity of thought and action long past the age when his brother of yesterday has become a wearied and wearisome man of the world. Any teacher in Harrow or Eton who succeeds, or remains at all, must consciously consider his most important work to be his active, happy, volunteer participation in the sports of the boys. There unconscious life-tuition holds most perfect sway. And in the long run character and not scholarship is the finest fruit of the high school.

E. WHAT THE PUBLIC MAY EXPECT IN DIVIDENDS: MATERIAL, CIVIC, AND SOCIAL

KATE UPSON CLARK, BROOKLYN, N.Y.

Theologians have deduced from sacred history and from analogy the theory that the Creator at first attempted the regeneration of the world thru the placing here and there of a good man. This experiment failed, because the good man died and his children did not continue his tradition. At last, Abraham was created, and was chosen to be the especial friend and ally of God, "because," says the record, "I know that he will command his children and his household after him, and they shall keep the way of the Lord, to do justice and judgment."

The preservation of high ideals from generation to generation in a whole people requires enormous racial force and insight. The great civilizations of old doubtless cherished the belief that the world would mount upon their shoulders to higher and ever higher things; and yet they went out like blown candles, until even now, as Wendell Phillips proved in his famous lecture on "The Lost Arts," we have not entirely recovered certain powers lost in their decline.

The chief instrumentality in our age and country for the perpetuation of our ideals is the public school; and one main reason why the ancients failed to perpetuate theirs is that they had no such schools. The author of *Gesta Christi* says that it is impossible to imagine the archons of Athens as taxing the rich in order that the helots might learn to read the Greek classics; or the Roman Senate setting apart a revenue providing teachers for the plebs and slaves. In our favored land, the rich are taxed so that the poorest may learn.

Not long ago an American capitalist, who has lived on both sides of the Atlantic, declared at a dinner party that he despised his country; that the government of the United States is the laughing-stock of all other nations; and that it is so honeycombed with sham and fraud that the structure even now totters to its fall.

"What do you think will follow—a monarchy, an oligarchy, or anarchy?" was asked him. He stammered some vague reply, from which it was gathered that anarchy would probably come upon us very soon.

Upon relating this conversation a few days later at another dinner, attended chiefly by young college men, one of them announced that he agreed with the capitalist. Since then, many others have been heard to express similar opinions.

The primary object of education is to so train the mind that it may, as Matthew Arnold says, "see straight and think clear" and may ultimately arrive at that culture which is "sweetness and light." The knowledge that education gives may be forgotten, but it gives also strong mental muscles, which, if their use is kept up, remain strong. An informed and intelligent mind is the first essential to a right judgment. Then, when the understanding is strengthened, the fallacy of the reasoning of the capitalist and the young college man can easily be shown and a wise patriotism instilled. Our children should know that, tho our public servants sometimes prove untrue, the people are, as a whole, honest. No country is controlled as much by public opinion as is our own; and that public opinion is generally right. When matters go wrong, we ourselves are to blame. We are too busy with our own selfish affairs to do our duty to the state. But from those whom the state has educated should come service to the state. In war, they would count it sweet to die for their country. In peace, it is just as much their obligation to lay their lives upon its altar, not all at once, as in war, but a little every week or every month; and the

sacrifice is even harder. No bands play. No crowds applaud. Slander and abuse are more likely to follow, but no less should the true patriot, as Browning says, "do out the duty."

It is therefore acutely necessary that, whether or not our children understand quadratic equations or foreign languages, they should be warned of the hideousness of intemperance and unchastity, the evils of bribery, the intricacies of blackmail, and the horrors of an unrighteous war, and that no other kind of war is possible between civilized nations. They should learn well the lesson that eternal vigilance is the price of liberty as much today as ever, and that because our forefathers cherished a beautiful dream of equality and democracy, and broke a rough, brave path toward its fulfillment, it is no sign that we shall move onward in that direction unless we constantly labor and agonize, even as they did, to advance nearer and nearer to it.

The first sheaf, then, which we should garner from the field of the high school should be that scholastic training which gives not only a fair amount of scientific and literary knowledge, but a disciplined reasoning power. Let it not be true of our high-school graduates that while "Knowledge comes" to them, "Wisdom lingers."

The second should be a broad and unwavering patriotism—a realization of their deep obligation to be a good citizen of what, with all its faults, is the best country under the sun.

Involved in this patriotism are many elements. Three stand out sharply.

The first of these is respect for law. In a land like ours there is no excuse for the outbreaks of lawlessness which occur from time to time. Bad laws can be changed by orderly process. In the greater part of our country such troubles are usually caused by foreigners. Since our public schools are the melting-pot for our thousands of aliens, as Mary Antin has so vividly pictured them in her *Making of a Citizen*, especial stress should be laid there upon obedience to law.

The second is the abolition of caste and class. Do fraternities and secret societies promote the formation of cliques and small, "select" circles, from which many are excluded, to eat their hearts out in grief and envy? If these societies do promote these most undemocratic distinctions, the teaching of a sound patriotism demands that they be driven out. Closely connected with this evil is that of race prejudice. Few of us are entirely free from this undemocratic and un-Christian weakness, and it should be stoutly fought.

The third element in the teaching of patriotism is the glory of honest work, and that every man and woman should be a "lifter" and none a "leaner." For those who can study no more after leaving the high school, the mastery of some vocation, or a fair preparation for earning fair wages at once is essential. If there is a vocational school near, that should be

attended. If not, the local high school should establish one or more vocational courses.

But the mere effervescent sentiment of patriotism counts for little unless behind it there is a pure and upright citizen. Scholarship without character is a curse. Horace Mann, in defining good citizenship, quotes the ancient statute of Massachusetts which was framed for the guidance of educators, and which sets forth this matter "in large and noble characters," thus:

> It shall be the duty of the president, professors, and tutors of the university at Cambridge and of the several colleges, and of all other instructors to exert their best endeavors to impress on the minds of children and youth the principles of piety, and justice, and a sacred regard for truth; love of their country, humanity, and universal benevolence; chastity, moderation, and temperance; and those other virtues which are the ornament of human society and the basis upon which a republican constitution is founded.

"The laws of morals," continued Horace Mann, "can be taught like any other laws, and are far more important than the laws of cube root. They are natural laws and always existed and depend on no religion. It disparages and degrades the subject to leave it to the teacher's option. We are bound," he concludes unequivocally, "to dignify it by making it a part of the regular course of study."

You have read of the ways in which these matters are managed in France, Germany, and England. The recent extensive referendum upon them in this country, in which probably many of those here present took part, revealed the fact that most of the teachers consulted, favored indirect ethical teaching. Thirteen per cent approved of religious exercises; 18 per cent appealed for a graded moral course. All agreed that "home influences" seldom harmonized with those of the school. The words of the teacher could scarcely be heard while the voice of the home was, as Emerson says, "thundering so loud in the ears." Gladstone expressed the matter almost as strongly when he said, "One example is worth a thousand arguments."

Undoubtedly the child receives powerful moral lessons from the thoroness, industry, punctuality, truthfulness, impartiality, and justice enforced in every good school, and from the cleanliness and kindness to animals required; but there should be something more. There are many other virtues to be taught.

There could be no objection, one would think, if our public-school children should be taught that they have not only a physical and mental but a spiritual nature to be cultivated. Let the child be a Jew, a Roman Catholic, a Theosophist, an Evangelical Christian, a Universalist, a Unitarian, a Christian Scientist, or what not, but let him be instructed that he should cherish some sort of a religion, devoutly and sincerely. Everyone who has any religion at all can testify to its worth and help. In a periodical

"important topic talk," very brief, but pointed, such advice might be given. It was not a sermon, but a "word fitly spoken," which was said to be "like apples of gold in pictures of silver."

But at the very base of a good citizen's civic efficiency, no matter how patriotic he may be, nor how moral and religious, lies the great concern of his health. A nation of sickly, degenerate men and women is bound to go to the wall. Not even the faithfulness nor the iron will of an Abraham could save them. Whatever else our young people do or do not bear with them from our high schools, they should take a knowledge of their own bodies, and of the fundamental laws which govern health and disease. In many modern schools an attempt is being made to have the teacher of hygiene, in addition to the periods in class, give to each child under his care a special half-hour alone for a more searching and intimate interview than would otherwise be possible.

We cannot turn out profound scholars or finished orators or statesmen from our high schools; but even at sixteen or seventeen the face may be set in the right direction, and every boy or girl who graduates, or takes even a partial course there, should have had awakened within him a taste for good literature, which will keep his education going on thruout all his life.

In a line with this important acquirement is the appreciation of simple pleasures. Many young people are infected with the idea that unless a large sum of money is spent, unless one can have an automobile, or high-priced theater- or opera-tickets, with indigestible restaurant suppers, and other luxuries, there is no pleasure. A happy home, no matter how humble, as the poet says, and the simple diversions which are within the reach of all, are usually the source of the deepest delights of life, and this cannot be too early impressed upon the young.

From our high schools should pour into society, also, an element of sanity and bravery under the bewildering trials and worries of life. There a training should be given which will enable a man to meet "ill luck," not with an imbecile smile, perhaps, but with a courage which will keep him from breaking down physically or morally, or from that last resort of the desperate and ill-balanced coward, self-destruction. Teach him to turn his face habitually toward the bright side of life, and to join in the glad cry which Browning put into the mouth of his David:

> How good is man's life, the mere living! — how fit to employ
> All the heart and the soul and the senses forever in joy!

But he should be equally instructed that it would be a

> Poor vaunt of life indeed
> Were man but formed to feed
> On joy,

and that sorrows must come and must be manfully met. With this stalwart courage and with good common-sense added, that rare gift, for the

teaching of which we have, alas, no textbook and no chart, one might be a useful citizen with little education besides.

Calculate as carefully as we may, our best-laid plans may not result in producing these qualities. You have heard of the little girl who prayed one night, "Please, God, make seven times six forty-eight," and, when her astonished mother asked for an explanation, said that she had written it so in her examination and she wanted it to be right. Seven times six will remain the same to the end of time, but as yet we cannot with such mathematical precision adjust our educational means to our ends.

Thus the dividends which the public has a right to expect from our high-school graduates in return for the vast sums expended upon them are: first, a fairly well-filled and well-disciplined mind; second, a sound and practical patriotism, showing itself in obedience to law; in sturdy industry and self-support; and in a genuine and brotherly democracy, free from snobbishness and race prejudice, and ever trying to help the less fortunate members of society; third, a good moral character, touched with a certain spirituality and at least a respect for religion, if not an experience of it; fourth, good health; fifth, a taste for good reading; sixth, a right perspective regarding true pleasure and plain living; and, seventh, a manly optimism in the face of defeat and trial.

These are the great essentials, and whatever must be left out, these must be somehow attained. Walter Pater says of Watteau that he painted scenes to the life, but he had "a marvelous tact of omission." That is something we need in laying out our high-school courses.

In addition to these more significant features, there are certain minor requirements which may be more important than they seem.

One of these is that the high-school graduate should be able to write a correct and presentable letter, with his address and the date always upon it—the latter not spelled out.

Another is that a degree of refinement should mark his manner. It sometimes seems as tho a high-school teacher should be chosen quite as much for his or her gentleness and politeness as for scholarship, and should thus afford a model in this respect. One sometimes sees a group of high-school girls on a street corner, all chewing gum, some of them with arms akimbo; some perhaps with paint and powder on their faces, and with those compressed waists which augur so ill for wifehood and motherhood; and all of them shouting and emitting loud peals of laughter; and it is a painful experience for one who loves his country. Let them chew gum if they must, but always in their own rooms at home and behind closed doors. As for unrefined attitudes, artificial complexions, tightly laced waists, and loud talk and laughter, these can surely be modified or even eliminated during a high-school training.

When the group is of boys, smoking cigarettes and interlarding their conversation with oaths and obscenity, the case is still more distressing.

Their health lessons should have shown them the dangers of nicotine, and their moral teaching, the vulgarity and sin of evil conversation, but what they need most is a better example from men whom they see and whom they are bound to copy.

The third plea is for better voice-culture, not for singing but for speaking. The American voice is too apt to have a quality which may be called "acridity," and no matter how fine a mind or pure a spirit may lie behind it, that voice is the voice of ignorance and vulgarity. The boy's oratory may have had a greater basis of fact than his hearers thought when he declaimed of the Pilgrim Fathers: "What do I hear? Is it the howl of the panther or the screech of the cat owl? No, it is our fathers at prayer." Too many of us have in our voices, even in prayer, more than a trace of "the howl of the panther" and "the screech of the cat owl."

But the final test of an education, as President Eliot has told us, is "continuous growth." Unless our high schools have given to their graduates the ability and the will to "climb" as long as they live, our system has failed in one of its most vital points.

F. THE WORSHIP OF THE "STANDARD"

WILLIAM HUGHES MEARNS, SCHOOL OF PEDAGOGY, PHILADELPHIA, PA.

Most principals and teachers agree that the "standard" of the school must never be lowered. Pupils may come and pupils may go, but the "standard" must be kept up forever. And undoubtedly pupils do go. At the end of every term-examination thousands of normally healthy youngsters drop out of the high schools like pits from a patent cherry-stoner. As a class they look much more useful than cherry pits. Judged by their report cards, one would expect to find them anæmic, stupid weaklings; on the contrary they are frequently a full-blooded lot, athletically built; they are apt to be good dancers, amateur actors, officers of social clubs, alluring and rhythmic cheer-leaders, Beau Brummels and Madame Pompadours. Their schoolroom ingenuity, full of life-giving joy for their fellows, is fatal to the teacher with a weak heart. They are clever of speech and remarkably well informed on matters not in the school curriculum—a thoroly likable group that has had a serious falling-out with the school "standard."

In a first-year high-school class I once found these youngsters composing 75 per cent of an algebra section. Thirty-six out of forty-eight had not come up to the end-of-the-term "standard."

The teacher, a man noted for holding a high standard, explained:

> Early in the year I discover the group in the class that can "get" algebra. It is usually about 25 per cent. To these I give my whole time and let the remainder shift for themselves. I told these fellows—the 75 per cent—frankly in the beginning of the

term that unless they got up steam we'd leave them behind in June. The result shows I was right. Why, there's no use wasting time on that crowd; they couldn't get algebra if they stayed here a hundred years!

I politely agreed with him. Then he went on to tell me how one of his former 25 per cent boys had just missed Senior wrangler in mathematics at Cambridge. That school is famous for its mathematic phenomenons; but the June reports showed that 51 per cent of the first-year class had failed in algebra.

The "high standard" of a famous Harvard preparatory school is maintained by a similar method. The prospectus announces that in all the years of its existence the school has not had a single failure in the Harvard entrance examination. Anyone sent up, they claim, is sure to pass; but care is taken that only those sure to pass are ever sent up. If there is any doubt about the boy, he does not get the chance. The hard-earned reputation of a dividend-paying school is the really important thing. To save some young chap from becoming a Harvard man may, after all, be a worthy act. The matter is more serious, however, when it affects the educational lives of children. Not so long ago, when ceremonious examinations were in vogue for admission to city high schools, the grammar schools that put thru the greatest proportion of successful applicants were given the highest official standing, and the only measure of the success of a grammar school was the percentage of pupils put thru the high-school test. Certain schools were soon famous as "100 per cent schools," those that year by year recommended none but successful candidates.

The high standard of the school was always at stake. Therefore rigid preliminary examinations were held to weed out those who might fail and so injure the record of the school. Many principals declined to consider a boy or girl who could not achieve an average of 80 per cent in the preliminary test, altho the city minimum was frequently as low as 65 per cent. The reputation of those institutions still lingers today. One of these, whose standard was almost notorious, gave searching written and oral examinations to every child that sought to enter the school at any grade, cleverly excluded the unclever—put them off on someone else, always with the explanation that "the pupil does not come up to our standard"—and openly advised the older pupils to stay two years in the highest grade in order not to risk a failure in the high-school test. There was rejoicing, I fancy, when a weakling dropped out thru overpressure, or when a slow pupil decided to learn the office-boy business.

As the rivalry among these schools grew more intense, one set of grammar schools held Saturday drill sessions, some began daily at eight o'clock instead of nine, and others declined to teach important examination-subjects like arithmetic and grammar until after the four-o'clock dismissal. "Home-work," aimed to hit possible examination questions, was added to the load. One principal had the requirements of the course of study

printed in condensed form for memoriter work, with a catechistical question-and-answer guaranteed to beat the most tricky examiner. These were sold to the children and used in the classrooms in lieu of textbooks. The public praised the work of such schools, the pupils were proud of the record, until a wise superintendent (I cite the case of one city) abolished the cram-examination. The old method of fact-grinding still continues in some spots, altho recently a district superintendent put the elimination and retardation test on one or two of such schools and showed a frightful dropping-out of pupils. In one case two hundred fifth-grade pupils had dwindled to seventeen high-school candidates. But each of the seventeen was a winner.

I recall how carefully I watched the five eighth-grade pupils that with others some twenty years ago made up my first experiment in teaching. Solely on their record at the final examination depended the standing of the whole school. I was early impressed with the fact that each of these five young persons carried with him 20 per cent of possible failure. When the likely-to-fail chap spoke hopefully of going to work, we stood ready to help him search the want advertisements and provide an irresistible letter of recommendation; when the clever sure-to-pass girl spoke carelessly of leaving school, we set to work upon her like a boss politician upon a wobbly voter. The boy or girl was really not important; the "high standard" of the school was wavering in the balance.

This story is given at some length because the college-entrance requirements have for years forced the same sort of program on the high schools. In some instances a particular college with a monopoly of higher education has turned the adjacent high school into a purely mechanical preparatory-to-college institution. Courses that do not lead to college have had a social taboo put upon them. And to secure good results at the entrance examination, really good students have been permitted to spend seven or eight years in a four-year high school—after finishing course A (four years), the pupil declines graduation, and completes course B (three years). The reputation of such high schools always stood unimpeached because their graduates won a large share of the competitive scholarships. Seven and eight hours a week of college-preparatory Latin crowded the more important English; physical training was practically eliminated; and there was no place for domestic science—or indeed any science—or for vocational training, local history and geography, social and economic studies, or any other subject vital to young people, but not included in the college-entrance requirements. There were no study periods nor helpful preparation in class for the next day's work; and the home study was a test of endurance. The result was a daily panic and a tremendous rush to the exits.

"All persons more than a mile high will leave the courtroom," said the King, looking severely at Alice, at which there was a tremendous clapping of hands from the audience, composed largely of private tutors.

The most ridiculous instance that I know to show the sacrifice of the individual to the high standard of the school is that of a young woman whom we shall call Irene Jackson, recently dismissed from an eastern high school. She was thirty years of age. She had spent fifteen years of her life in that high school trying to come up to the standard. For seven years she was a Freshman, for five years she was a Sophomore, for one year a Junior—which leads one to suspect there was something wrong with that Junior year—for two years a Senior. Probably she would have been there yet, competing with her grandchildren—for Irene never achieved a high-school diploma—had not the school commissioners abruptly dismissed all high-school students that had failed twice of promotion.

One can understand how Irene might have become thoroly attached to that school and have joined vigorously in the campaign of the alumnae against any change in the course of study, altho it had permitted her to spend the best of her life at an impossible task. We can fancy her emerging from her fifteen-year trial like the little maids from school who "all unwary, come from a ladies' seminary, freed from the genius tutelary," but one could never consistently picture her singing with Yum-Yum, Pitti-Sing, and Peep-Boo,

> Everything is a source of fun,
> Nobody's safe, for we care for none,
> Life is a joke that's just begun!

For Irene Jackson, life was a joke that was well-nigh over.

The objection brought by the so-called classical high schools against the introduction of manual training is based on a question of school standard.

A high-school principal in a recent newspaper interview explained:

> All the traditions of our school are academic. To offer manual-training courses would lessen the time we must give to the book branches if we wish to maintain the high standard of our institution. Courses in commerce and other vocational and trade studies would have the same effect. As we cannot afford to decrease the value of the diploma of the school, therefore we do not welcome the sort of pupil that would elect such courses.

This exclusiveness recalls how Uncle Remus warned Miss Sally's little boy not to associate with the Faver's children:

> Dem Faver's chillun wa'n't no 'count fo' de war, en dey wa'n't no 'count endurin' er de war, en dey wa'n't no 'count atterwards; en wiles my head's hot you ain't gwine ter go mixin' up yo'se'f wid de riff-raff er creashun.

I am reminded here of a conversation I had some years ago with the author of a beginner's Latin book. In a spirit of helpfulness I pointed out that the chapter on Latin participles could be understood only by one who already knew all about the Latin participles, and that Latin was difficult enough in itself without furnishing further obstructions in a lesson-book. His answer was characteristic of the aristocratic ideal that objects to educating the "riff-raff er creashun." He said cheerfully:

Here's just the trouble with you educational reformers. You want to make things too easy for pupils. Children must be interested—that is the modern cry. And what is it leading to? A lowering of the standard of education all along the line. The whole value of that chapter on participles is its difficulty; we put the screws on early to sift out the unfit. When I studied Latin it was no sugar-coated pill. It was a rough dose, but it did the business.

No doubt it did do the business for all except the few lucky survivors. Of course, there is no objection to a difficult Latin participle test, provided it were used solely to test a knowledge of Latin participles. Our quarrel is about the use of Latin participles on thirteen-year old children as the sole password for any further education at all.

If the aim of the public high school is to turn out the largest percentage of perfect products, then every indolent, weak, ill-informed, or slow-witted youngster lowers the average and should be got rid of. Such should go into the junk heap as imperfect parts of machinery. Everyone sympathizes with such an aim in a medical school. There the greater the elimination of the unfit, the better will the community be served. The object of the college of medicine is not to assist some young person to get a better footing in life, but rather to discover and train the greatest medical efficiency. Dental schools, law schools, engineering schools have small excuse for keeping half-equipped students; and particularly is it incumbent upon training schools for teachers to hold a high and inflexible standard. We do not need to have Plato's authority for our belief that it is the business of pilots to pilot and of cobblers to cobble. Let us have no foolish tolerance in selecting those who serve us in occupations that directly affect the public weal. No license should ever be granted to blind engine-drivers, to deaf bridge-tenders, to unskilled physicians, to unsympathetic teachers, to dishonest bankers, or to corrupt politicians.

But the object of the public high school is not primarily to turn out an example of skill; its fundamental achievement is to bring our young people a step or two nearer efficient manhood and womanhood, to insure for the next generation a healthier, better-thinking citizenship, to give youth a better training for his later daily work, in short, to make intelligent beings a little more intelligent. This marks the great difference between the school and the mill, altho both institutions may operate looms.

Some high schools are managed like a track team instead of a gymnasium class. A good track team consists of record-breakers, and only the possible point-winners are taken care of; a good gymnasium class consists of all sorts and conditions of physical aptitude and inaptitude, and the weak are prescribed for with even more care than the strong. The chap who cannot jump six feet or run a hundred yards in eleven seconds or hurl a shot so many meters is useless to a track team. Who would eliminate these fellows from the gymnasium hour, or the period of organized play? The track-team high schools have nothing but dismissal for those who do not qualify according to the arbitrary standard.

Every mother has a standard of health for the family, toward which she is daily and nightly striving; but she doesn't asphyxiate all members that do not measure up. Otherwise, it would go hard with the babies in colic time. Indeed, it is the weaklings that receive the tenderest mother-care. Annihilation, we all remember, was Plato's scheme for the underweight babies of his Ideal Commonwealth, the highest standard of efficiency on record. Some of those present may thank fortune that ours is no Ideal Commonwealth. If we had any misconceptions along that line, the recent party conventions have shattered them. As things are, in this imperfect American commonwealth of ours, we must get along somehow or other with the sort of family that has been sent to us.

The new conception of public education is the bettering of all the children of all the people. Dropping from the rolls a large part of the difficult cases increases our ease, but, nowadays, it has begun to prick our consciences. The uneducated "riff-raff er creashun" go on living "in our midst" whether we as teachers are longer bothered by them or not. To cast them out because they do not come up to a Latin-Greek standard, or an algebra standard, or a modern-language standard, or a college-entrance standard, when all the while the children should have been measured by a manual-training or a vocational standard, makes us indictable as bad judges of educational values, and particularly as bad judges of youth. We must take to heart Uncle Remus' plantation proverb that "Yo' can't handle no one-eyed mule on de bline side." So, obviously, our standard must rise or fall with the capabilities of our children: to this group it will be relatively high, to that group relatively low. If your high school becomes suddenly seven-eighths foreign born, as sometimes happens in the seaboard cities, your English teaching dare not remain aloof, but must come right down to the problem before it. If formerly you trained the sons and daughters of the professions but now thru a change in the character of the neighborhood you draw from the toilers, your purely academic standard must show some understandable civic reason for remaining unchanged; and the community should not accept wholesale dismissals of pupils on the ground that they are not prepared to go forward. Our business is to do something with the sort of pupils we get. A discouraged Pennsylvania high-school teacher complained to the superintendent, Henry Houck, "I can do nothing with this class. What do you do when your pupils come to you unprepared?"

"What do I do!" exclaimed Henry Houck, "What do I do! I *teach* 'em!"

As high-school teachers there is no particular virtue in holding a high standard if it results in cutting off all educational opportunity for the pupils that most need helpful guidance; nor is it wise for us to keep up a traditional curriculum if it has ceased to meet modern needs. We are diagnosticians of youth, and the curriculum and the standard are but changeable

means to an ever-various end. We must, to be sure, discover that the Childe Roland who to our dark tower comes has not succeeded in algebra and plane geometry, and make due report of the same; but our eyes must be open also to discover and make use of his native skill in chemistry, in athletics, in languages, in debate, in school journalism, in the management and control of his fellows, in money-making avocations, or in the manipulation of wood and metal.

And more than this. We must be able to put blood into pale faces, to correct flat chests, to straighten crooked backs, to clear out the clogged throat and nose, to add lenses to the eyes as well as to calculate the number of imperfect subjunctives in the first three books of the *Commentaries*. And no matter how squad-like these multitudes march into our rooms, we must keep in mind that each child belongs to some mother or father who cares for it. We must remember, for we get hardened somehow, that it is a tremendously important thing to have a child in the high school getting his life-career settled for him, and that to the little household the curt report of failure, without a word of suggestive help, has a damning finality too often carelessly unregarded by teachers. We should not feel satisfied in discovering only how far a pupil has fallen below the standard. That is to play the part of Alice's red-faced queen shouting, "Off with his head! Off with his head!" "Off with his head" is a thoroly unsocial attitude.

Every step in advance toward greater social and economic efficiency has seen a dropping of the standards. The achievement of free public education itself was a tremendous lowering of the standard; so was the 1776 declaration of equality of men before the law; so was the perpetration in American government of religious toleration; so were the slow grants of suffrage: to the upper middle classes of England (1832), to American Negroes fresh from slavery (1865), to English workmen (1867), to British farm laborers (1884), to American women (any minute); so was the inclusion of the backward child in the scheme of education and the introduction of the workbench for the academic incorrigibles. The growth of the belief in the brotherhood of man as against the ideal of a chosen people is a vast lowering of the standard. Even Calvinism has succumbed to the inevitable, broader movement; it has almost reversed its former stand of a democratic "fall" and an aristocratic "redemption." More folks are redeemable nowadays, even if the standard for the whole is not so high.

What steps in advance we have made! Time was when we whipped the weak-witted because they did not come up to our standard, and filled their lives with daily and nightly horror of failure. Not so long ago we used to harry with demerit marks those who had no mind for book-knowledge (that is, eye-knowledge and ear-knowledge) but had untold capacity for devilment and hand-knowledge. In the name of a high standard we used to keep feeble-minded chaps in the first grade at most unfitting tasks until they could no longer stand the mocking of their fellows. We used to force

all pupils, sick or well, to the same number of hours a week, and do so yet in many places. We used to compel all school children to sit for hours in silent rigidity, hands locked behind backs, with long detentions for those who squirmed or "spoke," until school became hateful and the freedom of the factory a welcome release. We used to make no attempt to teach the deaf to hear, or the blind to understand, or the stammerer to speak, or the mentally twisted to think coherently, for no school with a decent respect for its standard would have anything to do with them.

The term "high standard" has two distinct uses which we must never confuse. Holding a high standard means maintaining a high ideal. Let us by all means keep the ideal for each young person at its highest, and strive to bring him nearer to it than he would ever have been had he not fortunately met us. The ideal for each person is the best that he is capable of doing. But let us not be forever shouting, "Off with his head," when he does not do what we have arbitrarily decided he should be capable of doing. With all our twentieth-century study of young folks we should have done with trying to feed fine rich clover to impatient hunting dogs.

A high standard means a high ideal, but it means also the "dead-line." A prisoner that steps over the dead-line is instantly shot. A child that fails in spherical geometry and advanced French can have no further education from the state. The live side of that dead-line has been heretofore mighty slim for children between the ages of twelve and seventeen. Let us widen it. American boys and girls should not have to wait until they are "sent up" to a reform school before they can get the sort of education that will bring the best out of them. Too many able youngsters are being shot down for stepping over the dead-line, and every educational life thus snuffed out is eventually a telling loss to the nation. Every individual is important in a democracy, and no standard of education paid for out of the common funds dares say that any group of individuals shall have no help or guidance.

It is our business, particularly in the high school, to help young people to a better adjustment to the life they must eventually live—all the young people that come to us. It is our business, which we cannot avoid, to fit the intellectual and social needs of all the varieties of boy and girl that find their way to our charge, and of thousands of others whom we do not now attract at all. That is our high-school program for the future, and it is not impossible. Says wise Uncle Remus: "Folks dunner w'at *bin* yit, let lone w'at *gwineter be!*"

TOPIC: A NATIONAL UNIVERSITY

A. THE NATIONAL ASSOCIATION OF STATE UNIVERSITIES AND THE NATIONAL UNIVERSITY

EDMUND J. JAMES, PRESIDENT OF THE UNIVERSITY OF ILLINOIS, CHAMPAIGN, ILL.

I have been asked to make an address upon the relation of the National Association of State University Presidents to the movement for the establishment of a national university.

I desire to say in the first place that, apart from the facts which I shall give concerning the action of the association, I shall be presenting my own ideas. I believe they represent fairly well those of my colleagues in the association, and yet, as they have not been presented to them for their criticism or indorsement, I wish it to be distinctly understood that I am speaking for nobody but myself in the argument which I shall present on this subject.

After the fullest and most careful discussion of all phases of the subject the National Association of State University Presidents has repeatedly indorsed the project for the establishment of a national university. This means a university established by the federal government of the United States, deriving its support primarily from the federal treasury, subject to the ordinary control which a free government exercises over its organizations and their work.

I desire to lay down two or three propositions which seem to me fundamental in securing a proper position from which to judge this whole question. My first proposition is that in a free state education is fundamentally a national function. I do not mean by this that it is necessary for the federal government of such a free state to regulate, control, or support education; tho it may be desirable that it should do so. If the locality or the state or the two together, in a country like ours, will provide adequately for this national function, it may be properly enough left to them; but if they either do not or will not provide for it, then the federal government itself should undertake to see that provision is made. I mean, therefore, that education is a national function in the sense that it is of fundamental importance to the nation as a whole; that it should be properly performed, and if there is no other way to secure its proper performance except thru the co-operation of the federal government, then we should have this co-operation.

I maintain that in a state like ours education is a national function; because to the permanent endurance of a republic, popular education is an absolute necessity, and if it cannot be obtained by one form of governmental organization, then it must be obtained by another, or the nation will suffer the consequences. No free government can long exist which

is based upon an illiterate people—nay, I believe we may properly paraphrase Lincoln's great expression on another subject, that this government cannot remain permanently free if it is based upon a population half literate and half illiterate. All the people must become educated to the necessary extent to secure the basis for democratic government, or all will become uneducated, i.e., will fail to secure that degree of education necessary for the preservation of a free state. Now that is a national function, to my mind, in its nature, the adequate performance of which is essential to the existence of a nation. From this point of view, education after the national defense is the most distinctly national function of all the functions which our society has to perform.

But education is national in its nature from another point of view and should be recognized as such in the organization of our government. The advantages given by elementary and secondary and higher schools are not limited to the communities which support them. A little red schoolhouse upon a lonely hillside of a New England state may train the man who will head a great movement for reform and progress in a distant state beyond the Rocky Mountains. The people of the latter state profit by the education which that man obtained at the expense of that New England district, and they should, by all standards of fairness, contribute their part toward the support of the school which produced him. In fact I think it is not too much to say that, taken broadly, the history of this country during the last two generations will demonstrate that in many cases the chief advantages of the school system of a community have redounded to the benefit of other communities in which the particular boys and girls educated in these community schools have subsequently spent their lives and done their work as members of society. Now if all sections of the country profit by the existence of educational advantages in any one community, so the country and the nation as a whole should be expected to do its part in developing and supporting these local facilities for education.

There is another reason why education is in its nature a national and not a local or state function, and that is that the disadvantages of the lack of facilities and the lack of schools are not limited to the communities which suffer such lack of school facilities to exist. You hear a man say sometimes that it is up to the community to keep its school, and if it doesn't wish to keep one, let it suffer the consequences. But the same thing is true here as in the case just mentioned—the evil results of inadequate school facilities do not accrue alone to the communities which neglect such matters, but are liable to be of the most serious consequence to other and distant communities; because, under our scheme of life, the ebb and flow of our population is so continuous and so extensive that the boys and girls who have missed the opportunity for the highest development, owing to the lack of these local facilities, become members of other communities

and go into them and into their work weighted down with all the ignorance and apathy and indifference to higher things which is characteristic of an ignorant population as a whole. So that, alike by the distribution of its advantages and the distribution of its disadvantages, popular education is in its nature a national and not merely a state and local issue, a national function and not merely a state and local function, and consequently, unless the locality and the state can and will perform this function satisfactorily, the nation must come in as a unit and thru its organized representative, the federal government, contribute its share in this way to the support of this common institution.

We must not lose sight of the fact that it is after all the American people as a whole that pays the bills. It is not the nation distinct from the state or the state distinct from the locality; but it is the locality and the state taken in their totality which make up the nation; and it is therefore a mere question of expediency thru what organ and to what extent the people will exercise their power for the purpose of promoting the public welfare.

Now there is another important reason why the people of the United States should aid the cause of education thru their federal government as well as thru their state and local government, and that is that the people as a whole can do certain things thru the co-operation of their federal government which they cannot do thru their state government or thru their local government alone. The expense of an adequate educational system is enormous, and grows continually with the rising standard of the people as to what state education is. An adequate revenue system will draw upon national sources of revenue thru the federal government, upon state sources of revenue thru the state, upon local sources of revenue thru local government. Some sources of wealth may be more easily and efficiently tapped thru the federal government than thru the state or local government, and vice versa.

In our scheme of federal government in this country, we handed over to the central authority a revenue power—I will not say more than adequate for the federal purposes which we incorporated in our constitution, but I will say more adequate to accomplish the national ends contemplated in the law than were given to either the state or the locality. The federal government can raise funds in many respects more easily than either the state or the locality. And a sound financial system demands that that element in our system shall raise the revenue which it can raise most easily and then that a reasonable distribution of the revenue so raised among the various federal functions and among the state and local functions shall be made.

I think our history has demonstrated clearly enough already that education can never be properly cared for in this country unless we draw upon national sources of revenue as a means of assisting in its support.

Owing to history which I need not recount, the southern states, for example, find themselves in the position of having two independent and complete systems of education, for the white and colored races, respectively. It is quite unreasonable to hope that in our day and generation the southern communities will be wealthy enough, or, what amounts to the same thing for our purpose, will think they are wealthy enough, to care adequately for these great interests, and if the people will not utilize their other sources of revenue and their other organs of government to assist in providing a part of the means for the solution of this problem, we shall still continue to suffer as we have suffered for generations by this situation.

My next proposition is that this country cannot solve its educational problems in the large until it recognizes that education is the business of the nation and that pecuniary assistance for its support in a large way shall come thru the organs of the nation as a unit.

We cannot get the money in any other way. We refer, of course, by preference in our educational discussions to the unhappy educational conditions of certain portions of the South. But the conditions are just as really and just as truly inadequate over whole sections of the northern states as they are in the South. We need not go out of the state of Illinois itself to find schools which do not deserve that name. We need not go outside of Illinois to find local communities which, after taxing themselves to the limit which the law allows, still have not sufficient money to maintain during the months in which a child ought to be in school the kind of school which it is worth the child's while to attend.

There is another important matter which we ought not to lose sight of. Great national issues are pushed forward only when it is possible to secure national attention for them; only when they have become national in a formal as well as an informal way; only when the nation is discussing them as great national issues. If we could get national attention concentrated upon our educational problems year after year as one of the fundamental issues going to the very life of the nation itself, we should make vastly greater progress than we do. And this attention we shall get when we recognize the essentially national character of education by making educational policy a part of national policy. When the federal Congress discusses educational questions as fully, as completely as it discusses questions of defense and the tariff and internal improvements, we shall be in a way of securing for educational issues that attention which is necessary to their continuous and rapid solution.

Intimately connected with this fact, namely, the necessity of securing national attention for the consideration of national problems, if we wish to hasten their solution, is the further one that we could advance with far greater certainty and with far greater speed, our national standards, i.e., the standards of the people taken as a whole and in their local organizations, if we can get before the nation as a whole a proper standard of what education means and what education ought to mean.

The nation then, and not merely the local school district or community or state, must become an educational unit in all grades of education.

It has already become so to a certain extent. It is becoming so more and more with every passing day, unequally, it is true—in spots only—here and there, but steadily and persistently. The federal government has granted lands for the support of elementary education in nearly all the states of the Union within whose territory were to be found large stretches of government-owned land. In fact the federal grants were the foundations of the school funds in the vast majority of the states of the Union. And out of these grants has proceeded the organization of a system or scheme of education in nearly three-fourths of the states of the Union. But the federal government has not been content with this. It began some fifty years ago the policy of developing within each state in the Union a higher institution of learning supported in large part, first, by federal grants of land; second, by the grants of money realized from the sale of lands; and finally, by grants of money raised by the general revenue system of the government. Today we have sixty-seven such institutions which owe a part or the whole of their income to the action of the federal government. The aggregate value of the permanent funds and equipment of these land-grant colleges themselves exceeds today $125,000,000. The total income of these institutions in 1910 was nearly $23,000,000. It would take an endowment fund of over $450,000,000 to produce this income.

We take pride here in Illinois in the fact that it was an Illinois farmer and professor who first formulated this plan, and that the legislature of Illinois was the first American legislature to stand strongly behind this policy of federal grants to higher education within the states. It has become the greatest scheme of an educational endowment which the world has ever seen. The federal government itself contributes only a small part of the total funds necessary for the support of these institutions, but it was the giving of that small part which made the rest of it possible, which stimulated local and state interest, which by fixing national standards stimulated the nation to rise to these standards. I have very little doubt myself that, if it had not been for the action of the federal government in making these appropriations for the development of agriculture and the mechanic arts within the states, we should be a whole generation behind what we are in the development of our educational system.

Incidentally I may say that the House of Representatives of the Illinois legislature has again led the way in urging upon the federal government the necessity of large additional grants for educational purposes by sending to Congress a unanimous petition as follows:

WHEREAS, The legislature of Illinois by the joint resolution of February 8, 1853, was the first among the American legislatures to petition the Congress of the United States to make a grant of public land for each state in the Union for the liberal endowment of a system of industrial universities, one in each state, to promote the more liberal and practical education of our industrial classes and their teachers; and,

WHEREAS, The Congress not only made a liberal grant of land in the year 1862 for this purpose but has also followed up this policy once begun by still more liberal appropriations for the support of higher education in agriculture and the mechanic arts, resulting in the great chain of colleges for agriculture and the mechanic arts to be found in every state and territory in the Union; and,

WHEREAS, The time has now come for the adoption of a similar policy in the field of elementary and secondary education; therefore, be it

Resolved, By the House of Representatives of the state of Illinois, the Senate concurring herein, That the Congress of the United States be respectfully petitioned to appropriate annually to each state and territory in the Union a sum equal to one dollar per head of the population of said state or territory as ascertained by the last census, for the purpose of establishing, maintaining, and extending in the elementary and secondary schools of said states and territories, while not excluding other elementary and secondary subjects, such practical, industrial, and vocational training, including agriculture, the mechanic arts, domestic science, manual training, commercial subjects, and such instruction in other similar subjects of practical nature as the interests of the community may seem to demand; and

Resolved further, That our Senators in Congress be instructed and our Representatives be requested to use their best exertions to procure the passage of a law of Congress donating said sum to each state and territory in the Union for said purpose; and

Resolved further, That the Governor of this state is hereby requested to forward a copy of the foregoing resolutions to our Senators and Representatives in Congress and to the executives and legislatures of each of the other states and territories inviting them to co-operate with us in this meritorious enterprise.

I wish to emphasize again very strongly that national aid to education, whether lower or higher, does not necessarily mean excessive federal centralization and control. The extent to which the federal government shall have control of the funds which it devotes to education is a matter of expediency to be settled from time to time and from generation to generaton, as national and local needs and possibilities may dictate.

I should like to call attention to one other fact, and that is that the federal government when it wished to develop, by the expenditure of a comparatively small sum of money, a system of educational institutions which should have a profound effect upon the development of elementary and secondary education, chose to establish colleges, not high schools; colleges, not grade schools; colleges, not kindergartens. In other words, it recognized that in the development of an educational system in a country progress goes often from the so-called higher to the lower. You cannot develop a good high-school system unless you have a good college system which can supply the necessary teachers, the necessary guidance, the necessary stimulation, the necessary leadership. You cannot have good grade schools unless you have good high schools which furnish, taken as a whole, the training of the teachers employed in these elementary schools. The converse is of course equally true, that you cannot develop your college beyond a certain low level of efficiency unless the high schools can be brought up to a high level. Nor can you raise the level of your high schools to what it ought to be unless the grade work is done properly.

I desire again to call attention to the importance to educational advance of securing a national formulation, a national organization of the educational idea and educational ideal.

There is a subtle moral and psychological reaction upon the people as a whole arising from the formulation and incorporation of a national ideal in a practical national policy which spells progress and success for movements which are able to find such national expression.

As suggested above, when education is as regularly the subject of national debate and national conflict as the tariff, banking, and currency, internal improvements, we shall take another long step forward in our educational development.

What I have thus far said applies to all grades of education alike, and it is upon this foundation that in my advocacy of a national university I take my stand. If the views thus far advanced command your assent, I believe I shall have your consent to the further proposition I advance, namely, that one of the essential elements of our American system of education is the kind of a university which the federal government can build and which shall stand, so to speak, at the apex of our educational pyramid, or, if you choose to reverse the simile (it is all one to me), which shall be the foundation stone upon which the pyramid of national education shall be erected; for all history shows that from the universities, from the highest schools, have gone forth steadily those influences which have molded and shaped and fashioned the popular education in all times and in all countries.

I mean by a national university an institution sufficiently like the ordinary institutions with which you are all acquainted to be thoroly familiar to you. A teaching and training, as well as an investigative institution, manned with the best men in all departments in which the human intellect has exercised itself, drawn from the entire world, equipped with all that money can provide, for the purpose of stimulating and increasing our interest in the world of the spirit and the world of sense about us.

Now, one of the fundamental purposes of a university system is to beget, diffuse, and establish, in the mind—nay, I will say also in the heart of the people—the scientific spirit and the scientific method. If this can be accomplished, the face of the world will be changed. Now this can be done in certain respects more easily and more thoroly and more rapidly by means of a system of state and national universities than by any other means.

In what I am about to say I am not animated by any spirit of opposition to the historic private institutions of this country. He would be an ungrateful American indeed who would cast any slur upon Harvard and Yale and Princeton and the scores of more recently founded private universities, like Hopkins, Chicago, Leland Stanford, and Northwestern,

which are such an honor to our country and our civilization. I should certainly consider myself an ingrate if I should say anything derogatory of Harvard or Pennsylvania or Chicago or Northwestern, where as student or professor or president I had an opportunity to prepare myself for public service, and to have had some small part in the glorious work of these institutions. All honor to them, and increasing power and glory and prosperity! But, friends, however great they may become—and may their shadow never grow less—they can never accomplish the purposes we have here in mind, namely, to incorporate in a visible form the national ideal of university education.

I have long been a warm admirer of President Eliot, in many respects the greatest figure in American education. He was kind to me personally when I was a Freshman at Harvard. He was for more than a generation my guide, philosopher, and friend in the field of university education and administration. I think it is not too much to say that he revolutionized American higher education and revolutionized it to its great betterment.

But I know no more striking illustration of the fundamental weakness that doth beset us all than President Eliot's notion that he could make of Harvard a national university in the sense that we have been using the term here—that he could make a private institution, dependent for its resources upon the liberality and self-sacrifice of alumni, however generous they may be, or upon the whims of rich men, however numerous they may be, situated upon the edge of the country, even tho in such a glorious city as Boston—that he could make an institution so located, and so fathered and mothered, to be that embodiment of our national ideal of science and education and art which we are looking for. Other men have or have had the same notion for their institutions. Idle and vain hope. Neither Harvard nor Yale nor Columbia nor Princeton, nor all of them taken together, great as is their function, great as is their service, can hope to do this particular service for this country. Nor Mr. Rockefeller nor Mr. Carnegie nor both of them together, tho multiplied by five and animated even still more fully than at present by patriotic unselfishness and far-sighted motives, can do this thing for the nation, which after all only the nation can do for itself. The state universities of Michigan and Wisconsin and Minnesota and Illinois and the forty others—no one of them alone nor all of them together, great as they may become—and we are all headed for great things—can hope to fill this place, incorporating in themselves in such a way as to satisfy the national longing that deep-felt, that unexpressed ideal of university education.

The reason is simple. No partial expression will satisfy this longing for wholeness. When that which is perfect shall have come, that which is imperfect will unite with it and help constitute its perfection—private and state institution, with the national university, making one complete system—or it will dry up and disappear. When that which is complete shall have appeared, that which is incomplete must become a part of it

or be sloughed off or cast into the scrap heap. No national university can exist except as the creation and organ of the national will, shaped and directed by it. Supported and sustained by this national will, it will be the expression of you and me and all of us, we a part of it, and it of us.

Such an institution would not injure, but benefit, every private and every state university, by its superior support, by its superior prestige, by its greater wealth. It would strike the popular imagination of this country in such a way as to give to the university idea itself an enormous impetus, the reflex effect of which would show itself in the increasing prosperity and development of every private and state institution.

The foundation of Leland Stanford did not injure the University of California, but helped it immensely. The foundation of the University of Chicago did not injure Illinois or Northwestern or Michigan or Wisconsin, but by the bold and striking way in which it raised high aloft the standard of science it gave an impetus to the university idea which made the work of every one of these institutions more adequate and more easy.

The same thing would be true in a larger degree of a national university, organized along proper lines, and put under proper influence.

Such a national university as I have suggested, located at the site of the federal government, supported by appropriations from the federal treasury, controlled and regulated by federal law, would easily become, as it ought, the crowning institution of our university system, private and state alike. It could supplement the shortcomings of our other institutions as well as emphasize their excellences. It could undertake many enterprises of national scope, which no existing single institution, public or private, can afford to undertake. It could offer to our best-qualified young men and young women opportunities which only a nation like ours can afford to offer.

Such an institution, located in the national capital, would exercise a vigorous and salutary influence on the course of federal legislation itself. Its pointed spires and gilded domes would of themselves be powerful tho mute monitors calling attention to the claims of science to be the guide of legislation.

Such an institution located in the center of political power of the greatest nation on earth would attract in large numbers the bright and promising youth of other countries, who as students here would imbibe those fundamental American ideas which we fondly believe are destined to work out the salvation of the world when they shall have done their perfect work, while these youth would gain added respect for our society and our ideals, which carried back home and incorporated in their own policies would contribute powerfully to that mutual understanding which is the surest basis for international peace.

Such an institution, located in Washington, could utilize for purposes of instruction and investigation the wonderful resources heaped up by the government of the United States in its scientific developments. The

National Library, the museums and collections of all sorts, lie largely fallow at present, waiting for the people of the United States to make their utilization possible in the various schools and colleges of a national university.

Such an institution, located at such a strategic point, will wield a subtle, ever-deepening and ever-widening influence over the whole American people in the direction of increasing their interest in and belief in science as an important element in private and national life. It will be their university, and they will come to take an increasing pride in, and appreciation for, the work it is doing; and thus will by this reflex effect be trained gradually to entertain an ever-deeper respect for the standards and ideals of higher education itself.

Friends, such an institution is coming, as surely and irresistibly as the tides of ocean. Will you help it or will you oppose it, or, worse than either, will you do nothing?

This National Education Association could secure the establishment of this institution in a short time if it would only go after it in earnest. Ignorance and apathy and prejudice have thus far been most potent in preventing the realization of this dream of Washington. Private institutions, religious and secular, have opposed, thus far successfully, the movement. Private institutions, men of wealth, men of no wealth, men of ideas, men of no ideas, have set themselves against this project. It is up to you and the like of you to help bring this about in our day and generation.

This great power can be set to work immediately in the interests of science and art and education, supplementing, reinforcing our defective and weak system of education. Every day its coming is delayed represents so much pure loss to the causes in which you are interested, to the welfare of this nation, and to civilization in general, of all that it might contribute if it were now at work.

This institution, this national university, would be one of the most important elements in making this nation of ours in reality what it is in our dreams and hopes and fond anticipations, the leader of the world in art, in science and education, and in civilization.

B. A NATIONAL UNIVERSITY A NATIONAL ASSET; AN INSTRUMENTALITY FOR ADVANCED RESEARCH

CHARLES RICHARD VAN HISE, PRESIDENT OF THE UNIVERSITY OF WISCONSIN, MADISON, WIS.

GUIDING PRINCIPLE

At the outset the guiding principle may be laid down that at Washington there is no necessity for a university of a type which exists elsewhere, no need of an additional university like the great endowed and state institutions of the country. One who advocates a national university at Wash-

ington with the idea that it shall be a larger Harvard, Yale, Columbia, Cornell, or Chicago, a larger Michigan, Illinois, Wisconsin, Minnesota, or California, will fail in his advocacy, because he cannot give to Congress a sufficient reason for the expenditure of public funds for another university of a kind of which there is a sufficient number. Not only would such an advocate be met by the above fact, but by the fact that in Germany, where universities are most highly developed, they are state, not national, institutions.

If, then, it is not desirable to establish a bigger Harvard at Washington, what is the aim of those who are advocating a national university? It is to make available for the advancement of knowledge the unparalleled facilities of Washington to graduate students.

At Washington are the Congressional Library, the National Museum, the Smithsonian Institution, the Geological Survey, the Bureau of Mines, the Naval Observatory, the Public Health and Marine Hospital Service, the Army and Medical Museum, the Office of Public Buildings and Grounds, the Board of Ordnance and Fortifications, the Bureau of Education, the Weather Bureau, the Bureau of Animal Husbandry, the Bureau of Plant Industry, the Bureau of Chemistry, the Bureau of Soils, the Bureau of Entomology, the Bureau of Biological Survey, the Bureau of Corporations, the Bureau of Manufactures, the Bureau of Labor, the Bureau of the Census, the Coast and Geodetic Survey, the Bureau of Standards, the Bureau of Statistics, the Bureau of Fisheries, the Bureau of Navigation, the Bureau of Immigration and Naturalization. In these and other bureaus and divisions are available a vastly wider variety of material for scientific research and a greater collection of books and manuscripts than elsewhere exist. To enumerate in detail the facilities and materials available for work in each of the domains of knowledge would require more space than is allowed for this entire paper. Also, such a statement is rendered unnecessary because of the admirable report regarding the matter by President Arthur T. Hadley;[1] but to serve as illustrations some of the facilities for a few of the lines of knowledge are mentioned.

For the modern humanities, political science, political economy, and sociology, there is a wealth of material in nearly every department. The Department of Labor, the Interstate Commerce Commission, the Census Bureau, the Bureau of Statistics, the Bureau of Pensions, the Bureau of Immigration and Naturalization, and the Bureau of Corporations, are all applied divisions of political economy and political science. Nowhere else in the country is there such a mass of first-hand information regarding many of the most pressing problems for these subjects. Also the various government activities of Washington, comprising Congress, the executive offices, the judiciary, and their numerous divisions and branches, give illustration of practical political science on the largest scale. At Washington not only

[1] Arthur Twining Hadley, "Facilities for Study and Research in the Offices of the United States Government at Washington," *Bulletin 398, United States Bureau of Education.*

may the student of political science have the material of the subject, but also he may appreciate with what labor and difficulty results are achieved in practice.

For history, and especially the history of America, at the Congressional Library is a vast amount of material, indeed practically everything which is in printed form; not only so, but in the library is a vast collection of documents. In the State Department, the War and Navy Departments, etc., are the archives of the government since its foundation, all but a small part of which are available for the student of history.

For anthropology, the National Museum and the Bureau of Ethnology have collections and materials of the first order of importance; indeed no other collection of the country can approach them, with the exception of the American Museum of Natural History in New York.

For physics, astronomy, and mathematics, there is a great mass of material in the National Observatory, in the War and Navy Departments, in the Coast Survey, the Bureau of Standards, the Weather Bureau, the Patent Office, and other departments.

In chemistry, there are laboratories in almost every department and bureau, which deal with materials both organic and inorganic.

For geology and its related subjects, geography, paleontology, and physiography, at the Geological Survey and the National Museum is found one of the world's largest collections.

For biology, there are available the National Herbarium, the Biological Survey, the Commission of Fish and Fisheries, the botanical division of the Department of Agriculture, the National Museum, and other departments.

Passing now to applied science: Almost every phase of advanced engineering work is illustrated by some division of the government. The material which would be especially available is that found in the War and Navy Departments, the Bureau of Mines, the Coast and Geodetic Survey, the Division of Architecture, the Hydrographic Office, and the Land Office.

For agriculture, practically the whole department except administration is devoted either to the advancement of the science or to the dissemination of practical information. This great department had an appropriation for 1911 of more than $20,000,000, the larger part of which went for scientific and extension work. An enumeration of the divisions of the Department of Agriculture shows how wide is the scope of this work: the Bureaus of Animal Husbandry, Plant Industry, Weather, Forest Service, Chemistry, Soils, Entomology, and Biology.

While the Department of Agriculture has by far the largest appropriation for scientific work, the appropriations for scientific purposes in other divisions vary for each from more than $100,000 to more than $1,000,000.

While it would not be easy to give an accurate statement regarding the amount of money which is available in the various departments at Washington for investigation and for the tools of investigation—apparatus and

books—it is safe to say that the total amounts to many millions of dollars per annum; or put in another way, more than ten times as much as any single university or institution in the country for this purpose.

The vast collections of books in the Congressional Library and the large special libraries in the various departments, especially those of the Geological Survey, the Surgeon-General's Office, and the State Department, cover a greater number of fields of human knowledge with an approach to completeness than exists elsewhere in this country. These libraries are admirably administered. Expert assistants are available, so that the material on any given subject is readily secured. Not only so, but special privileges are granted in the reading-rooms and in the stacks to qualified students. The facilities in these respects are incomparably beyond those of any library in other countries. It is safe to say that the collections of books in the government libraries at Washington could have an efficiency ten times as great as they now have at a small additional cost.

Manning the scientific bureaus and divisions is a scientific staff many times larger than in the largest university in the country. It is this amazing wealth of men and material at Washington that should be available for the production of scholars and investigators along many lines.

THE DEMAND FOR IMMEDIATE RESULTS

At the present time, unfortunately, the demands for immediate results by the government compel the great staff to give by far the larger part of their energy to special problems with reference to practical ends. The rich materials from the larger point of view of the advancement of science are in large measure neglected.

LARGE SCIENTIFIC RESULTS OBTAINABLE

If in each of the bureaus and departments mentioned there were advanced students working on the materials there existing, not with reference to the solving of particular problems which engage almost exclusively the attention of the existing staff, but with reference to the advancement of science, there can be no doubt that results of untold value would be obtained. It is believed that the utilization of this material in any bureau or department by a limited number of students need not interfere with the efficiency of the department in reaching the immediate results demanded by the government. Not only so, but it is believed that a group of advanced students, which in any department would not be very numerous, but which in Washington as a whole would aggregate a large number, could be made the means of greatly improving the work of the scientific staff of the various bureaus.

In making the statement that the bureaus at Washington yield relatively little in the way of broad scientific results, it is realized that there have been and still are some exceptions. When the United States Geological Survey

was originated there was drawn to Washington the most brilliant group of geologists in the country. This survey for a number of years was the center of the world for the advancement of the science of geology; but in recent years, while the organization is vastly larger, having appropriations of millions where it had in the early days appropriations of hundreds of thousands, it is almost exclusively a department of practical geology. It is not contributing in any large way to the advancement of science.

That contributions of the Naval Observatory to science have not been large has been known for many years. In 1898 a report was made by a committee of astronomers showing that the practical duties of the Naval Observatory could be easily performed by a very small establishment. In this report it was pointed out that a national observatory is justified because astronomical observations and research might there be made which cannot be accomplished at private and university observatories. The great new observatory building at Washington is splendidly equipped to carry on researches of the highest character; yet at the present time the advancement of the science of astronomy in this country is thru Harvard, Yerkes, Lick, Mt. Wilson, and other university and private observatories. The astronomers all agree regarding the first step necessary to remedy this situation, as does also the president of the United States and the committee on naval affairs. There should be appointed a civilian astronomer of the highest rank as director of the observatory. If this were done and the large facilities were made available to advanced students, this institution might take first place among the observatories of the world.

At the present time the advancement of science in its broader aspects is contributed to by only a few of the scientific bureaus at Washington, illustrated by the Coast and Geodetic Survey and the Bureau of Standards. On the other hand, in the universities of the country men are engaged in teaching and each year necessarily considering their subjects in the large, and immediate results are not demanded. These universities and the few independent research institutions, illustrated by the Carnegie Institution of Washington and the Rockefeller Institute of New York, are the chief centers for the broader contributions to science and learning.

THE RELATIONS OF TEACHING AND INVESTIGATION

It is my conviction, based upon many years of observation and experience, both in a university and in a department at Washington, that upon the average a man produces the best scientific results who does some teaching. To give a course to a group of advanced students requires that a man go over the subject broadly. Even if the course be highly specialized, a man must consider his material, not only in its interrelations, but its relations to the other branches of his science. One who is a productive scholar scarcely gives a lecture upon a subject which he is investigating without illumina-

tion reaching him upon some point. There is nothing more productive of ideas than the presence and inquiries of young and earnest minds. A man who at Washington sits at his desk six days in the week, delving in his subject, often becomes buried in his material. Too frequently he never sees it from the outside. His material masters him instead of his mastering his material. The successful teacher must get outside of his subject and consider its broader aspects.

I believe that the productivity of the scientific staff at Washington, even from the point of view of immediate results, would be improved during a given period, if each year the men of reputation were each obliged to give one set of lectures for at least a half-year, either upon the subject under investigation, or some part of a science related to the investigation. The opening of the scientific bureaus at Washington to such students as are sufficiently advanced to take advantage of the material, and affording opportunity to members of the scientific staff each to give a course of lectures, would greatly improve the efficiency of the bureaus.

However, in order that the lectures may be successful, it is necessary that they be a part of the official duties of the scientific staff, not extra work for additional compensation. At the present time, because of the meager salaries, a number of men belonging in the departments give lectures in George Washington University or other institutions, thereby gaining additional compensation. This is an extremely unsatisfactory condition of affairs, in that it requires teaching to be done in addition to the day's work at the bureau. In order that lectures shall be efficient and the man who gives them gain the most inspiration and the largest broadening effect from them, they should be a part of his regular work. By the proposed combination under which a relatively small amount of instructional work would be given by any member of the scientific staff, I confidently believe that the work of the various scientific departments and bureaus, considering only the point of view of efficiency, would be greatly improved.

Thus in creating the conditions essential for the special national university which should exist at Washington, we should thereby increase the efficiency of the departments.

An incidental important gain which could come from the adoption of the plan proposed would be the training of men to fill the scientific staffs at Washington. Under present conditions, we know the staff contains many mediocre men. While this is due partly to lack of properly trained men of ability, it is realized that it is due also to niggardly pay, combined with the high cost of living at Washington. Too frequently a man who develops unusual ability in a bureau either goes to a university where he obtains better financial terms and more favorable opportunities for scientific work; or, because he cannot decently support a family upon his salary, he goes into some profession or business in which he can apply the knowledge he has obtained in a department.

THE REQUIRED MACHINERY

We now have the fundamental facts before us. Not to arrange so as to utilize to its highest efficiency the vast wealth of material for scientific research at Washington is nothing short of improvident and reckless waste of great opportunities. It is a wrong to a member of the staff to demand that he grind away at his practical problem year in and year out without giving him a chance for a larger view thru instructional work.

If the above conclusions be accepted, the next question to be considered is the machinery required in order to secure these desirable ends. It may be said at the outset that for the national university here advocated, while some money must be available, no large appropriations are necessary. The institution must have an executive officer. Under him must be a staff, the duty of which shall be to learn all of the scientific possibilities of the various departments and bureaus, to advise students who come to Washington, and to arrange for their work. It should be the further duty of the administrative force to prepare announcements of the courses of instruction which are to be given, with descriptions of the material available for such courses, precisely as is done by each of the universities.

The administrative force of the national university, if desired, might be associated with the Bureau of Education; indeed this would seem to be a very natural association. If this suggestion be accepted, the administrative staff and the Bureau of Education could both be housed in a single building and such co-operation established between the two as would be to their mutual benefit.

For the above work an administration building or a part of a building is necessary. Temporary quarters should be rented, and later, when experience shows achieved results warranting the expenditure, an appropriate permanent building should be constructed. In the administration it would be necessary to provide some lecture-rooms, altho the halls in the National Museum and in various other public buildings should be utilized for the larger lectures. The men who give specialized courses to small groups of students probably would prefer to give them in the building in which they work; for there would be the materials and the special libraries. This would require merely that each bureau or institution, illustrated by the Naval Observatory, the Geological Survey, the Bureau of Animal Husbandry, set aside one room of moderate size for lectures.

One of the obstacles in the way of the highest success of the plan is the insufficient housing of many of the departments; but the obstacle will gradually be removed. This is evidenced by a number of exceptions. At the Congressional Library there is ample space for all the students who may desire to come. In the magnificent new National Museum, where are associated the wonderful collections in geology, mineralogy, biology, anthropology, etc., is the most ample set of workrooms and laboratories anywhere in the country. Scores of students could there readily be accom-

modated without interfering with the effectiveness of the staff. The Naval Observatory has a splendid new building. The Bureau of Standards has adequate quarters. All these new structures have become available within a few years, and others will undoubtedly exist within a comparatively short time.

EXISTING LAW

Already the principles above advocated have been recognized to a certain extent by Congress thru two enactments, the first in 1892 and the second in 1901. Under these acts the scientific collections, museums, and libraries of Washington and their other facilities were made accessible to scientific investigators and to advanced students "under such rules and regulations as the heads of the departments and bureaus mentioned may prescribe."[1] Apparently the act of 1892 also contemplated that the advanced students who do work in the departments would have the assistance of the members of the scientific staff, for the preamble includes the phrase, "promote the work of education by attracting students to avail themselves of the advantages aforesaid *under the direction of competent instructors*."

These laws have been taken advantage of to a small extent. As pointed out by President Hadley, their main service has been to men who are already trained for their work and are competent to carry on investigations independently of direction. These men have simply come to Washington and there used for their ends the material which the departments have afforded. For advanced students who still need the guidance of formal instruction the effect of these laws has been so small as to be almost negligible. Substantially the only exceptions are the one or two departments in which the scientific staff have voluntarily as a part of their duties given instruction either to the younger members of the staff in order better to fit them for their work, or to outside men. The best illustrations of this are furnished by the Bureau of Standards, the Public Health and Marine Hospital Service, and the laboratories of the Bureau of Fisheries at Woods Hole and Beaufort.

EXPLANATION OF MEAGER RESULTS

That no large results have come from the acts mentioned, one of which has been a law for more than ten years, might be regarded as evidence that the position above taken concerning the desirability of making the opportunities at Washington available for scientific work is unsound. However, it is obvious that the failure of these laws to produce marked effect is due to three reasons.

First: There is no information published describing the facilities for research at Washington and the different lines of work which may be there profitably pursued.

[1] Annotated Federal Statutes, Vol. II, pp. 860–61 (Edward Thompson Co.).

Second: There has been available no single bureau to which application can be made for the use of the facilities, no one to guide the work of the advanced students, no one to correlate the different lines of work. It is perfectly futile to suggest that a student go to Washington, enter a bureau, tell some official that he has come to take advantage of the provisions of the laws mentioned. This a man would not do; and if he did so, the chances are that he would gain very little satisfaction by so doing, for he would be lost in the mazes of the bureaucracy. As President Hadley puts it: "The student who comes to Washington today to get his scientific training in the government departments comes under his own impulse and at his own risk."

Third: For effective advanced work it is necessary that regular instruction be given. The existing laws do not provide for such instruction. If the proposal be accepted that members of the scientific staff be permitted as a part of their duties to give a limited amount of instruction, this fundamental necessity for successful advanced work is met. In this connection it is notable that in those instances where instruction has been given by the members of the staff, illustrated by the Bureau of Standards and the Bureau of Fisheries, the facilities for advanced instruction have been taken advantage of. It seems to me that these cases in which important scientific results have followed systematic instruction furnish conclusive evidence that if the principles applied in these bureaus were extended to other bureaus, the facilities and opportunities would be taken advantage of upon a considerable scale, perhaps as great as their facilities permit.

Therefore, if the opportunities for scientific work at Washington were as definitely described as are the courses in the catalog of a university, if there was a central place to which a man could go to register and be guided to his work, if he could have an opportunity to have his work correlated, if he could have the assistance of the man with whom he wished to work, then I confidently believe that there would be a very large number of students who would take advantage of the unexampled collections and libraries of Washington.

To make these facilities still more available, it would be advantageous for the various universities of the country to co-operate with the Washington authorities. In the catalog of a university it might be well to announce the particular lines of work and the advanced courses which could be advantageously taken at Washington best to supplement the work done at the university. Such co-operation would even more clearly emphasize the fact that the plan for a national university at Washington is not one to compete with existing universities, but to supplement them. Of course, no university could be compelled to co-operate as suggested, but it can scarcely be doubted that a large number would enter into co-operation, since so doing would be to the advantage of their students. Thus it is believed that the proposals made, if adopted, will result in a great gain to science in the country and also be of direct advantage to existing universities.

It is to be noted that the plan outlined does not include that of granting degrees. The fundamental thing advocated is that the country gain the advantage of the opportunities which exist at Washington, which it may do with comparatively little additional cost. To accomplish this it is not necessary that the departments undertake the task of examinations, the approval of theses, and the awarding of degrees.

If there be prejudice against calling the institution above described a national university, it may be given some other name, since as a matter of fact the institution proposed would be different from any existing university in that it would not profess to give a complete system of courses regarding any subject, but would give such specialized courses as the facilities at Washington make advantageous; and also it differs from a university in the respect that it would not grant degrees. For my own part I do not particularly care whether or not the institution of which I speak be called a national university; but I am most anxious that the great opportunities at Washington, both in the way of materials and men, shall be available as instrumentalities for advanced research, and that this shall be a national asset.

PROPOSALS APPROVED BY STATE UNIVERSITIES

The proposals made are in perfect harmony with the plan for the establishment of a national university, approved by the National Association of State Universities. In the bill introduced into Congress with the sanction of the association, it is proposed that the essential idea of the national university be opportunity for study, not the granting of degrees. It is further proposed that no student shall be permitted to work in the various departments until he shall have had the degree of master of science or arts, or equivalent training. This would require that a man shall have his first degree and shall have pursued graduate studies for one year and thus have gone far enough in advanced work to become qualified to begin a piece of special investigation. After a student has continued his work at Washington to the point where he should have a doctorate, he may take his examination and qualify himself for his doctorate at the institution at which he previously studied, and thus add to the prestige of that institution. Naturally a part of such qualification would be a thesis prepared by using the material in the bureaus and departments. If the universities outside of Washington should co-operate with the Washington scientific staff, a student at Washington might be to a certain extent under the guidance of the university from which he came, and by this means his entire graduate work be made a harmonious whole.

NOT A RIVAL TO EXISTING INSTITUTIONS

Thus the proposed national university would not be a rival to existing institutions, but supplementary to them; not supplementary to one of them, but supplementary to all. In Germany it is the habit of students when

studying for a doctorate to spend a part of the time at one university and a part at another. In some cases the work for the doctorate may be done at more than two institutions. The plan to have the departments at Washington available for advanced work would undoubtedly result in giving to many students a broader training than they now secure because of the fact that they would do a portion of their advanced work in a university and a part in the research departments at Washington. This arrangement would be most advantageous, for a part of the work would be done in institutions where the spirit is that of a university, and a part in the bureaus where the spirit is that of immediate results; and it is the combination of the ideal and the practical in a man's education which gives the highest capacity for future useful service to the nation.

SUMMARY

In summary:

1. It is proposed that the unapproached wealth of books and materials at Washington for research be made available to the advanced students of the country having the baccalaureate degree and one year of graduate work or its equivalent.

2. It is proposed that the scientific staff at Washington be authorized as a part of its official duties to give a limited amount of instruction.

3. It is proposed to establish an administrative division, the duties of which shall be to make the facilities of Washington known and to guide the students to them. If desirable this division may be made a part of the National Bureau of Education.

4. It is proposed that a student completing his work for a doctorate at Washington be granted his degree from the institution from which he came.

5. It is proposed that existing universities co-operate in this work with the departments at Washington.

If this plan be adopted, it cannot be gainsaid that science in America will receive a great impetus; that the scientific bureaus at Washington will be inspired to escape from their bureaucratic bonds at least in some measure, and if so they will make larger contributions than heretofore to the advancement of learning. All the above results may be accomplished by a relatively small expense and to the mutual advantage of the United States departments and existing universities.

C. A NATIONAL UNIVERSITY AS RELATED TO DEMOCRACY

JAMES H. BAKER, PRESIDENT OF THE UNIVERSITY OF COLORADO, BOULDER, COLO.

In reviewing the history of the movement for a national university, one is impressed with the great names connected with the project, the strength of the reasons in its favor, and the increasing clearness of thought regarding the need and functions of such an institution. Still more impressive are the high ideals for democracy maintained by the many advocates of the cause. The affirmative arguments have always appealed to me as funda-

mental, broad, and far-sighted. They show a comprehensive and hopeful view of civilization.

That the conception of a national university, and even the reasons for its need, should change in more than a century was to be expected. But, from the first expression of the idea by George Washington to the present, its scope was to be greater than that of existing American universities. The plan as it now appears may be described briefly: At the national capital are scores of departments and bureaus connected with the government, which might contribute to various lines of research. Vast sums are invested in libraries, museums, and laboratories. A large body of scientific men are employed in what may be called the educational service of the departments. It is proposed to establish by act of Congress a university of the United States; give it a board of trustees guarded from political bias and influence; include the scientific agencies, mentioned, in the university scheme; invite the co-operation of various organizations privately endowed; choose a faculty of eminent men, including those now prominent in the scientific work of the government, whose duty, in conjunction with the trustees, would be to utilize present resources and plan lines of future development. Of course the proposed plan would necessitate adequate buildings independent of the various departments of the government, and large financial support. The functions of such an institution in many fields of applied science are obvious. But its scope would rapidly enlarge. To some extent facilities are now found in the departments for special investigation in the natural sciences, agriculture, engineering, and medicine; in history, political science, economics, and law; in anthropology and education; in literature. In a university organization these would be strengthened and supplemented. A national university should represent profound scientific knowledge, its application to the practical needs of the country, the study of all economic, political, and social problems, every phase of human betterment, in short all that pertains to the welfare of a people. Moreover, it should aim to enlarge the boundaries of knowledge, to teach an idealistic philosophy, and to emphasize the spiritual side of our civilization. And all this should be done to an extent and with a thoroness possible only in such an institution. In other words, there should be at the center of government, as the highest interest, complete opportunity for studying the vital problems of the nation.

History does not show an exact parallel to our proposed national university, altho two noted institutions are suggestive examples, the University of Berlin and the University of Paris—one the Royal University of Prussia, the other the most prominent national university of France. For a century the University of Berlin has been a great factor in the growth of Prussia and a surpassing influence far extended on university standards and ideals. The University of Paris, by its relation with many educational agencies of the great capital, will create a new chapter in the history of education.

The remarkable development of Germany has been due in no small part

to the intimate relation of higher education to the state. More than a hundred years ago great leaders in Prussia saw in it the means of increasing the strength of the nation. They understood the vital force of an education that seeks foundation principles, that increases knowledge, that gives power of appreciation, that opens up large spiritual visions, that places men trained in scientific power at the service of the state. They knew that its influence in time would pervade the whole nation and change the spirit of the people. The University of Paris, under its present organization, comes nearest to our conception of a national university. It has its own buildings and faculties, but it has also a co-operative relation with many centers of liberal and scientific knowledge in Paris. The national and municipal resources for study and investigation are serviceable to the University. While organically Oxford is not a national institution, yet in a more important sense, in spirit and history, it has been closely related to the political affairs of England. It has represented state, church, and the form of society. That it has been a large factor in England's greatness goes without saying.

It has often been argued that an independent foundation should take the place of a national university, or that some private agency should control the resources of the government for research. The contribution of independent colleges to learning in the past and their value for the future are not questioned. They represent an element of freedom helpful in progress. But this proposition defeats one of the chief purposes of a national university, namely, its reciprocal relation to democracy. Moreover, to intrust the control of the government bureaus to any private organization would be an obvious absurdity.

It is claimed that education is not a function of the general government. In avoiding some Old-World evils we limited the powers of Congress, but the constitutional argument against a national university has never been taken seriously. Moreover, it was never intended that Congress should be merely a lawmaking machine without the higher motives and interests. And here I may speak of that larger view of the functions of government which extends beyond police regulations and commercial affairs. In the Old World are seen everywhere evidences of a culture which has been fostered by a broad governmental policy. If rulers had never been the patrons of art and letters, our civilization would be less rich in its most valuable elements. Here is a vital question in studying the problems of democracy.

The national commissioner of education some years ago said he did not dare to ask for a fuller recognition by Congress of his bureau, fearing it would be abolished or made a political asset and be used for patronage. The Bureau of Education was then housed in a building hardly fit for a tenement, the office force was limited, and the commissioner was on a starvation salary. We are familiar with the recent efforts to increase the

extent and efficiency of the Bureau of Education, and the reluctant consent of Congress to enlarge the appropriations. I do not note this as evidence of difficulties in our way, but to prove the need of a university, backed up by all the ideal forces of the nation, to educate Congress. The congressional wagon is not hitched to a star; the statesman's vision does not always reach to the hills whence might come his help—perhaps that is not to be expected. But critics of the times claim that the whole spirit of legislation is materialistic when not political and partisan; that appeals on ideal grounds are little heeded; and that the chosen representatives of the nation fail to lead democracy, even when the occasion and duty are obvious. The interests of government should be enlarged. We need a keener knowledge of the elements of civilization and of the meaning of democracy. One of the first steps would be to give our representatives something to think about besides politics and business. A national university at the capital would be an ideal influence and indirectly would act upon the whole country. It would tend to bring into direct union the ideal and the practical with mutual benefit—the academic atmosphere would be clearer, and the political atmosphere would be purer.

My argument now is not on the practical value of a national university —that it would correlate and economize and make more efficient the scientific agencies in Washington, that it would be the means of studying every problem of universal interest, that it could organize the work of every important investigation and get the co-operation of the universities of the country, that it would aid and strengthen and stimulate the scholarship of all the universities, that it would increase our material welfare, that it would foster our national pride and patriotism—my argument is concerned with the deeper thought of a union between democracy and higher learning.

In Germany higher education is related to the state; in America the problem is far more difficult—to relate it to democracy. A few educated men at the head of affairs can value science and culture; pure democracy in its formative stages may be shortsighted, fail to see its own true goal, and even be suspicious of the means of attaining it. Democracy in its present form is on trial—a trite but true remark. If its only gods are those of prosperity, if education is to be superficial and purely practical, if we refuse to think, if business engages in Middle-Age baronial exploits and politics is "bossed," if "reactionaries" and "progressives" get farther apart, we may be compelled to serious thought. Will the people as such have the vision and aim at the best the centuries have produced, and the progress the future demands? The problem is to be worked out in freedom, and, if successfully, in accord with true principles. Responsibility fits for responsibility, and the rule of the best is secured thru freedom—a maxim which Gladstone often vigorously proclaimed. I believe we shall have a safe and high development of our civilization when essential university learning relates itself to every human interest and problem, and the people strive

for, and make their own, all that the best in learning and leadership represents. A gentleman recently wrote me, urging the

> University of Colorado to form a "University Educational Union," and make the best thought in the world on political and economic science accessible to each individual, and let him form his own conclusions therefrom. I am convinced that the organized universities, or enough of them organized to give the stamp of authority, can furnish a peaceful solution of social problems.

This may be visionary, but it is mightily suggestive. The "reactionary" with all he stands for, and the "progressive" with all he stands for—I am using the terms broadly—must find a common ground in this country or worse follows. The ground of safety between extreme doctrines of government, between contending factions, between classes, will be found by the closest union between education and democracy—thru enlightenment and ideals. Culture, pure science, social justice, absolute values must be erected in our pantheon as well as the gods of success. These must command the reverence of the people and stand for the spirit of government and of public officials. Education—its knowledge, its ideals, its influence—must be the fourth estate in a democratic government. And it will be the duty of the educational forces of the country, in conjunction with every wise leader, to inject new elements into public affairs. And here is the real argument for a national university. If the character of this institution is to differ from existing types, if its scope is to be larger than formerly conceived, it is because we have a clearer insight into the nature and extent of the problem of civilization—a problem not confined to this country but world-wide. Universal education, necessarily superficial, and now increasingly practical, will not suffice. The organization of society must rest on a basis of truth and justice—the ideals of the scholar. The fundamental knowledge of nature and of man in society must be sought in an institution having profound learning, creative power, broad sympathies, and unlimited resources for investigation. In one of the states there is a close relation between the people, the government, and the university. The experiment has awakened large interest; it is yet new, but hopeful. This idea enlarged suggests the function, and the relation to the country and the world, of a university of the United States. The traditional culture, isolated if not often selfish, is a thing of the past. The modern university spirit is not only cultural, but scientific and practical, and is related to real life and today's problems. We have now to make it intimately a part of our government and society. When the people no longer depend upon authority, they must conform to what the philosophers call the "nature of things"—essential relations revealed definitely by the clear insight of the scholar.

Discussing, a few years ago, with a professor in the University of Paris some question of the enterprise of the two governments in issuing educational literature, he said:

I know the business quickness of the American, but we are wedded to a past which we cannot get rid of, and which, to be frank about the matter, we do not wish to get rid of. There are elements in our civilization, of essential value, which it will take the New World a long time to understand.

I could only reply that there was no controversy on that point. This represents a foreign criticism common enough, and to an extent just. "We are busy doing things and have no time to think," is a common boastful claim. We have been buying our education abroad, as we are now playing refined robbery with the art treasures of Europe. We need to transmute some of our wealth into science and art at home. There is no danger so great as a dead level of democracy, holding back the ideal spirit struggling to free itself. The people must be led by the wisest, and they must see that real excellence in a few is for the good of all. If we are to gain the respect of older civilizations, we must show that democracy is not superficial, that it has a high ideal of government, that it can be fertile in scholarship and especially in appreciation of its value and service. The "glory that was Greece" will never be ours, unless our ideal is built of spiritual elements that have given leading nations their place in history. If we have a boasted new form of state and society—the body—we must see to it that we have also the new humanism and the new idealism—the soul. If we have a unique civilization, if we have a peculiar mission, then let us have an unequaled center of learning at the very heart of our national life, adequate to reveal that life to ourselves and the world.

D. WAYS AND MEANS: THE NEXT STEPS

WILLIAM O. THOMPSON, PRESIDENT OF OHIO STATE UNIVERSITY, COLUMBUS, OHIO

The idea of the national university has one quality: it persists. Many educators have not been favorably disposed, while others have been firmly of the opinion that such an institution is the logical and highly desirable, if not necessary, conclusion from a century of national experience. The legislators and promoters of national legislation have been so much occupied with questions of statecraft and political expediency that but few men in our congressional halls have either time or disposition to give the project attention sufficient to warrant an intelligent opinion. The practice of objecting is easily cultivated and the suggestion that education should not be under the control of political influences is an easy method of closing the way to a thoughtful consideration of the merits of the issue. It should be recognized at the outset that a proposal for a national university would face these and other objections. Congressmen and senators have a way of paying profound respect to the opinions of educators when they open the way of escape from any responsibility and leave them free to devote their

energies to questions of political expediency and to the favorite industry of re-electing themselves. It may be recognized that a large amount of time and energy is spent in this way and that no important issue or principle is involved in such activity.

Education is not a political issue. Office-holders recognize this fact and therefore are slow to give it any consideration. Even agriculture, now the most popular diversion of the time, could not secure the large consideration given it were it not for the fact that there are votes behind it. Agricultural extension and farm demonstration have already become valuable political assets for congressmen and there are indications that the further development of these praiseworthy objects will be associated with a powerful and pernicious political influence.

A national university makes no such appeal, for the reason that it would be devoted to the less tangible phases of education. The study of research problems in pure science or in a true interpretation of history, economics, or politics does not make the spectacular appeal to legislators. It is easier to visualize the beneficent effects of two blades of grass or a large yield of corn and cotton than the effects of a revision of the scientific hypothesis concerning molecules, atoms, or electrons.

The first fundamental problem, therefore, is to set out and get into the national consciousness a true conception of the value of a great national graduate institution that should utilize for educational purposes the resources of the government already accumulated and increasing every year. The assumption is often made that existing educational agencies may be relied upon to care for all the research work needed. As a matter of fact they have but a limited access for such purposes to the resources of the government. Well-advised people know also that government officials hedged about with the technicalities of Washington have not sympathized with the movement to make any use of these resources for the further development of science and education.

A few years ago the Association of Agricultural Colleges proposed the utilization of a portion of these resources for the purposes of graduate study and investigation of fundamental scientific problems in agriculture, with the purpose of developing better equipped scholars in the sciences related to agriculture, but met with indifferent success. Men hesitate to welcome any new movement that might interfere with autonomy or prerogative. There is but little general intelligence upon the opportunities now in possession of the government for the advancement of learning and of science. The result is that very little enthusiasm is aroused when a proposal to utilize those opportunities is made. Existing agencies, especially our universities and colleges, are making the most limited use of them. The further statement is probably true, that they never will use them with high efficiency. There is no reason in the nature of the case, then, why colleges and universities should not urge a national movement in the interest of

science and scholarship that would organize the resources of the government into available material for study and research.

The notion that a national university should be so organized as to be a competitor with existing colleges and universities for students or for money is not worthy of any time or consideration. Such a university would not be a place where thousands of students would congregate but, let us hope, a place where the most eminent scholars of the country could be gathered, often temporarily, from existing universities for the purpose of leadership and counsel with matured students already graduates from local institutions. Our first need, then, would seem to be an appreciation of the unused opportunities at hand and a national conviction that these should be utilized.

A second problem is to secure a consensus of intelligent opinion as to the general scope and purpose of such a university. As already intimated, its purpose could not be found in the idea of competition. It must crown rather than compete. For years the federal government has been engaged in scientific work of a most important character. The Weather Bureau, the Geological Survey, the Bureau of Mines, the Department of Agriculture with its varied projects, all suggest a large amount of scientific and educational work. The motive in these has been the public welfare and national self-preservation. There would be no disposition to interfere with or check such important agencies. These have demonstrated that there is a large unoccupied field for the most valuable service. Any student of the history of scientific research in this country will say that the limitations are painfully evident. The permanence of men and money and the organization free from these limitations is most fundamental. In the course of the years cabinet officers and members of Congress have learned something of the importance attaching to the scientific work of the government, while but few men have risen to a conception of the importance of a university organization that, with the hearty co-operation of universities and scholars, would stimulate and aid every educational enterprise in the country.

It is interesting to observe that in case of the most widely known agencies of the government in scientific endeavor like agriculture, mining, and others, but few people were enthusiastic at the beginning. The reasons were two: first, a theory that the government had but a limited police power; and second, a lack of appreciation or belief that pure science had any practical relation to the everyday problems of the people or of government. Both of those theories have been abandoned and we are now trying to urge a further advance and a university organization for the utilization of unused and unrecognized opportunities. My second appeal must be, therefore, for a study of the situation by the teachers and scholars of the country in order that a consensus of opinion may result. This will give us a basis for action.

A third step might be the agreement upon a bill that shall serve as a

charter with a comprehensive plan of operation. Most of us are familiar with the form of the bill so long advocated and pressed by the late Hon. John Wesley Hoyt. This provided for an undergraduate organization and for that reason probably failed to enlist enthusiastic support in many quarters. It had, of course, the opposition of all those who could not agree to the idea of a national university and to the idea of federal aid to education. These objections would continue against any bill that could be drawn. The National Association of State Universities drew a bill a few years ago providing only for research and graduate work and requiring a Master's degree or its equivalent as prerequisite for enrollment and omitted any provision for the granting of degrees. This, of course, met with some opposition but chiefly outside of the constituency of state universities. The important issue now is an agreement upon a measure that will recognize existing agencies of research and of education and yet make provision for doing what is not now done. The crowning of our democracy with a distinctly national movement in the interest of education, of scientific research, and the discovery of problems affecting our national life is a project that should have the leadership and support of educational statesmen. When our ideas are cleared up and put into a systematic and defensible form we shall have taken an important step toward the realization of the vision that has been before us for a century.

A fourth step I suggest is the education of Congress. It has taken years to gain the assent of that body to other ideas of importance. This is by no means a reflection upon legislators but a testimony to the fact that the American people move slowly in projecting great and far-reaching movements. I need only cite the Land Grant Act led by Hon. Justin S. Morrill in Congress. This was the outcome of long debate and much discussion, then vetoed by President Buchanan, and finally enacted in 1862 under President Lincoln. The Panama Canal is another example of doubt, debate, delay, and final decision. Congress is still uncertain as to the propriety of federal aid to education. Many people in the country share in the doubt. Those who believe in the theory have yet a large amount of work before assent may be given. The agricultural college and experiment station movement avoided the direct issue under the plea of conserving the soil and of perpetuating national welfare. The vocational bill now before Congress follows in the same general plea by making appeal to the industrial interests of the nation. I doubt whether either of these measures is entirely justifiable on so narrow a basis. The broad issue is whether education is an interest of all the people or a local issue of the states. There is also a constitutional question as to the power of Congress in appropriating money and the objects for which it may make appropriations. The plea that the states are able to provide all the means necessary for education does not meet the case. Grant that they are able, the basic question remains as to the relation of the federal government to the cause

of education. The disposition to avoid the question is quite apparent. That there is opposition of an honest kind to federal aid is beyond question. Before any active movement for a national university can gather much strength this question must reach an affirmative answer. The traditional interpretation of our Constitution has been to leave the question of education to the states. It should be noted, however, that in disposing of public lands in the Northwest Territory and in the several land grants by Congress, it is plainly discernible that the support of education was regarded as an equitable distribution to the people of public resources. When the people and their rulers can be brought to see that higher education and the highest or deepest education as well as the advancement of science contribute to the welfare of all the people without regard to state lines, it will be easier to interpret the public-welfare clause of the Constitution to be in harmony with the scheme of national education. This will not be done by legislators, lawyers, and courts until the educators of the country have made the principle so clear that popular opinion both approves and demands action at the hands of Congress. An ignorant people rarely founds colleges. The leaders, carried forward by their ideals, lay the foundations and await the verdict of the future. So long as the country remains in ignorance of the need or opportunity of a national university, its existence may not be anticipated. So soon, however, as intelligent co-operation on the part of the educated people brings into the national consciousness a conviction that the federal government may return to the people for education a reasonable proportion of the revenues gathered from the people, it will be as easy to build a university as to build a warship. As a matter of fact, the defense which we provide thru the agency of a warship is usually imaginary while the ends sought thru the activities of education are at least intelligible.

A fifth step I propose is the development of popular sentiment. The national university proposal as I see it is a challenge or perhaps an inquiry as to the powers and privileges of the people. Have we, by adopting a Constitution, entered into contract with ourselves that education is none of our business; that it is a local issue and must find all its support and inspiration from local organizations? Or is it a question of a progressive interpretation of that great and notable contract in the interests of life, liberty, and the pursuit of happiness as well as in the interest of wars, rumors of wars, and other ignoble ends?

For a long time we have interpreted our Constitution to mean that the public money—that is the people's money—might be expended for the protection of life and property. To this there is unanimous consent.

The national university proposal raises the question whether the people may spend their money for the development of life and property. Happily we have been approaching that issue steadily. The developmental functions of government have been steadily increased and we are now proposing to go a little farther and ask the federal government to co-operate in a

constructive way by encouraging education, thus bringing help and strength to every educational enterprise of the land. We are not asking the interference or destruction of existing institutions or systems of education, but we are asking that the people and their officers take a national vision of this most fundamental work of society and establish an institution that shall be a crown of glory to all our educational effort.

I am aware that some are objecting because they fear the results or doubt our ability. Let me assure all such that there need be no fear for either individual or institution from a government or an institution of a government operated in the interest of the people. I have known college presidents who sincerely believed that the prosperity of one institution was at the expense of another. Their political economy was of the old horse-trading type. Happily that has passed away. The new political economy recognizes that education begets the desire for education; that educated people will be able to earn their daily bread; and we are optimistic enough to believe that an educated people will destroy neither themselves nor their institutions. A national university properly conceived is an institution neither of destruction nor of repression but a fitting expression of the purpose of all the people that among other objects public revenues may be used to provide, encourage, and foster education as a sure foundation for national life and the perpetuity of the free institutions of a free people.

TOPIC: THE RELATION OF THE PUBLIC SCHOOLS TO THE MOVEMENT FOR RECREATIONAL, SOCIAL, AND CIVIC OPPORTUNITY

A. HOW A COMMUNITY MAY FIND OUT AND PLAN FOR ITS RECREATION NEEDS

ROWLAND HAYNES, FIELD SECRETARY, PLAYGROUND AND RECREATION ASSOCIATION OF AMERICA, NEW YORK, N.Y.

An architect in his workshop is not a very interesting object, nor are his blueprints, plans, and computations very thrilling. We care more for his results in completed buildings. The same is true of a recreation survey. Results are more interesting than the methods, but I have been asked to give you briefly some account of the methods used in a recreation survey, in order to show how any community may find out and plan for its recreational needs.

The purpose of a recreation survey is to help in planning for an adequate recreation system, one which ministers to the whole recreation life of a community. This recreation life may be roughly divided into that which is occupied with home recreation, private recreation, commercial recreation, and public recreation. An adequate recreation system includes all these parts, and a public recreation system seeks not to compete with

any of the other parts, but to supplement home and private recreation, to exercise oversight over commercial recreation, and to furnish opportunities for wholesome public recreation to those who are not otherwise cared for.

In several cities it has been found that, while from 50 to 70 per cent of the entire recreation life is being cared for after a fashion by home, private, and commercial forms, of the remaining 30 or 50 per cent which would naturally fall to the care of public recreation, only 5 or 10 per cent is being handled by such agencies. In short, it has appeared that public agencies are doing only about one-fifth of the work which comes to them. Where there is such a large field to cover, and where there is no community in the country which is at present adequately covering the balance of the recreation life which would naturally fall to public agencies, it is of prime importance that any development or extension of a recreation system in any community, large or small, should be based on such a study of its recreation conditions that there shall be no duplication and waste.

A complete recreation survey of any community would take the form of a census, telling for each member of the community how much time each week during the different seasons of the year he or she has for recreation; how and where this time is being spent; and, where the recreation is not of good quality, what are the recreational needs of different groups. Such a complete census would take from two to five years, according to special conditions in each community. A preliminary survey, however, is often necessary in planning the foundation of a recreation system. It is of such preliminary surveys that I am speaking in this paper. They should not take more than one to six months, according to the population of the place in question and the number of workers.

Such a survey should cover three main topics: first, recreation activities of the three chief groups in any community, namely, the school group, the unmarried working group, and the home group; second, facilities and supervision; third, plan for development. The purpose of the study of the activities of different groups is to show what they are doing in the way of recreation, and what each main group needs. The second part of the survey, that on facilities, should show precisely what the city already possesses in the way of facilities, in school plant, park plant, libraries, museums, streets, etc., and what supervision it already has in the working force of all of these departments. Such a study of facilities should come to some definite conclusion as to what the city has available to meet the needs which have been shown in the study of the activities and exactly what further facilities the city would need to secure in order to build up an adequate recreation system. The third part of the survey should present a definite plan whereby the facilities which the city possesses may be used to meet the needs which the city has been shown to have. It should also outline the steps whereby needed new facilities may

be secured, and it should consider the form of administration and the unification of supervision.

The first step in the actual survey is to get all the relevant facts already assembled by other people. Thus the census report will give figures for computing the density of population in different wards of the city; the school census, if correctly taken, will indicate the distribution of children in different parts of the city. Social workers in settlements, charity organization societies, and similar associations can give preliminary hints of the recreation conditions in different parts of the community. If any studies of housing conditions, or of conditions of factory or department-store employment have been made, these will furnish useful hints.

Following this bird's-eye view, the next step is a study of the amount of outdoor play space in different neighborhoods. Usually, to save time, it has been necessary to select a limited number of definite districts or "soundings," and study those with particular care. Such a study makes possible a statistical table showing what percentage of space in any given sounding of 50 or 100 acres is taken up with streets and alleys; what percentage of space is taken up with private yards so occupied that play is impossible; what percentage is taken up with buildings and interspaces less than 25 by 25 feet—the smallest space on which three or four children can play for any length of time—and what percentage is free play space. In these soundings observation is made of the traffic conditions in the streets, which ones have heavy traffic dangerous for play, and which have only intermittent traffic permitting occasional play. Paving conditions are also noticed, as affecting availability of streets for play. These soundings are taken after school hours, so as to combine with the observation of the amount of play space, an observation of what the children and young people outdoors are actually doing.

In some places the children in the upper grades of the grammar schools have been asked to write on what they do with their spare time. The children are asked to write definitely about what they did in a definite period of time, say last Saturday and Sunday, or last week, and are told, if they say they played, to tell *what* they played; if they say they went to a show, *what* show. Care is also taken that the pupils know that the teachers are not to read the papers of their own pupils. The purpose of the essays is not to display scholastic achievement or to give the pupils a chance to make the teachers feel that they are doing much studying outside of school, but to get the children to write frankly the absolute truth. It is sometimes helpful to have the children not sign their names to these essays, merely stating their age, school, and grade, and whether the paper is from a boy or a girl. Thousands of such papers from school children in different cities have been gone over under my direction, and are sometimes the most illuminating part of the entire study.

The theaters, moving-picture shows, dance halls, penny arcades,

shooting-galleries, amusement parks, bowling-alleys, billiard halls, and other forms of commercial recreation are visited during the course of the survey, at enough different times to be sure that a typical week's attendance is being observed, and if necessary a disguise is used to avoid attracting attention. Likewise information is gathered from private institutions such as churches, lodges, and clubs, and from public institutions like parks, libraries, and museums, to see how much they are really being used for recreation purposes. In getting this information, a record is sought not only of the number of people reached by each institution in a week, month, or year, but also how much of the recreational life of those reached is furnished by the given institution.

When it comes to forming a definite plan for the building-up of a recreation system in any community, certain practical facts must be carefully considered, such as the probable financial resources of any department under which the recreation work is to be carried on, the type of administrators who are likely to control, and the amount of freedom from pernicious political influence possible. Here it is often not a case of any theory of city government, but a case of deciding whether Mr. John Smith, or his successors, in a certain position of power, is likely to be more effective than Mr. Charles Jones, and his successors, in some other position of power.

Some of the surveys already carried on have revealed striking facts. Thus it has been found in certain cities that over one-half the children were doing nothing after school hours, neither playing nor working; that 70 per cent of children were on the streets; that there was less for the girls than for the boys to do in the way of play; that the moving-picture shows were drawing every week a number of patrons equal to twice the population of the entire city; that only from 2 to 9 per cent of the space not taken by streets or alleys was free for play, even in cities not considered very congested; that a number of people equal to one-half the population of a given city were strolling on a given 10 blocks of one street every week.

To show concretely the problem before an adequate recreation system, let us take the illustration of one of the smaller cities surveyed, a place of 130,000 inhabitants. In this city were found 25,000 children and young people who would be dependent on some form of public recreation for the proper use of their spare time. This was due to the fact that, owing to the congestion of population or home conditions, they were unable to secure this wholesome recreation by their own efforts. In this city the school enrollment was somewhat under 20,000 people. Experts have calculated that the amount of recreation time per week varies from 20 to 40 hours with people of different ages. A school system occupies the time of its pupils from 25 to 40 hours per week, according to the amount of outside study required. Efficient, clean-cut habits of thought

and character are developed by the really successful school system. Well-supervised recreation develops habits of quickness of thought, fair play, and teamwork which last thruout life. In point of numbers reached, of hours influenced, of lasting effect on character, the task before a recreation system is not less difficult than that before a school system.

The work of the school systems of the country deserves every dollar appropriated to it, but much of the millions of dollars invested in our school systems is wasted owing to the fact that, outside of school, children form wrong habits due to unwholesome play conditions, and develop traits of character which make much of their school training useless. Because of the size of the task before an adequate recreation system, because of the need of a recreation system to save from loss the enormous investments in schools and other municipal services, because of the call to avoid duplication and waste in the face of this unmet need, many communities are trying to find out and to plan systematically for their recreational needs.

Let me conclude this outline with two quotations from papers written by school children. The first was written by a girl of fourteen:

> In the evenings when I go out to play, or the children round our way, we do not have anywhere to play, because the people that haven't any children fuss if we go in front of their house. There aren't any playgrounds around for us to play in.

The other was written by a boy of thirteen:

> I went to the moving pictures and stayed until late. I would have kicked football, but the people would not allow it because of the dust. I threw a few rocks at some Negroes. For fun I get the football and kick it until I am told to go away, and then I go to the alley. It cuts the ball to have it kicked on the cobble-stones. I with several other boys play on the railroad bridge, jumping, resting from the heat of the sun, and learning to run fast and to do tricks on the ties. If we are careful we don't often skin our shins.

The girl who cannot play because the folks who have no children fuss if she plays in front of their house, the boy who throws rocks at Negroes because he cannot kick a football, are but types of recreation problems. In all our surveys and statistics, we should keep clearly in mind that the purpose of them all is to save and develop character—the character of the children and young people of this country, the most precious asset which it possesses.

B. THE RELATION OF SCHOOLHOUSE ARCHITECTURE TO THE SOCIAL CENTER MOVEMENT

DWIGHT H. PERKINS, CHICAGO, ILL.

The recent form of social awakening known as the "social center movement" is already touching the arts, and making occasion for new architectural forms, since it presents the problem of housing new and

distinctly modern needs. This movement differs from its predecessor, the settlement movement, in that it is purely co-operative, not philanthropic in character. It is one of the latest and best incarnations of the spirit of democracy and, since the public school is perhaps the best expression of our national spirit, and the citadel of our democratic institutions, the relationship between the social center movement and the public school is bound to be natural and fundamental.

A study of the growing use of schools for social and civil, as well as educational, activities will reveal the tendency of the times and the present and desirable relationship of schoolhouse architecture to the social center movement. While this influence has not as yet produced a complete and distinctive type of schoolhouse planning, its effect upon building in general is marked in other directions, and is more and more modifying the arrangement and style of buildings for educational purposes from the kindergarten to the college.

The time has gone by forever when a building with a sufficient number of classrooms and, to some extent at least, ventilated and warmed will be considered an adequate or proper school to house even the recognized present-day needs of a community. We are in the transition stage of growth.

The most obvious effect upon schools up to the present day has been that the front door of the schoolhouse is left unlocked for a greater period each day and for more and more days in the year, so that the key is becoming less and less necessary and ultimately may be thrown away. In other words, the first great change due to the insistence of the public to reclaim its own has been the greater use of school buildings rather than any specific change of form or structure.

This change of use has come about first in the yards, their equipment as playgrounds and their use during vacations, bringing with it directed play. The period of such occupation is expanding to conform to seasons and is overlapping the school term, both before and after summer vacation. A similar overlapping is taking place before and after school hours each day, and that extension is a direct response to the public demands for evening use of gymnasiums and assembly halls.

It is the common thing now to build elementary city schools with thirty or more square feet of playground space per pupil. It is also usual to arrange space for ornamental and experimental gardens and to plan for assembly halls and at least one gymnasium as well as rooms and equipment for domestic science and manual training. It is also common now to see high schools with natatoriums and with two gymnasiums—and to see them located in spacious grounds and athletic fields. Modern high schools include not only large assembly halls but small lecture and society rooms as well. Shops for the many occupations of both men and women are realities; even the lunch-room is not omitted from the high school of today.

An exhibition of plans of new and recently proposed school buildings would be an inspiring revelation of the extent to which the public mind has fixed itself on the enlarged use of schools and the rapidity with which school planning is responding to these ideas. But without waiting for the tangible form of new ideals, the existing features are being thrown open evenings to the parents and to young men and young women employed in the daytime, not only for their education, but for their entertainment and social contact as well.

How shall this be done without interference with the school child and without too great a burden upon the taxpayer? For one thing, by a systematic arrangement of hours which would make possible the use of buildings and equipment already installed and otherwise idle during long periods of time. The expense then becomes limited to the services performed by teachers, play-leaders, and janitors. Of the services of teacher and play-leader, it is not the province of the architect to speak. As to the janitor service and the control or segregation, we can observe existing schools in social center use, as well as social center buildings not connected as yet with our school systems, and learn from them the extent and manner in which the growing demands are shaping our educational buildings.

As to the schools themselves, it has long been the custom to install small separate heating units so that the assembly hall, or public portions only, may be heated in the evening without running the large plant necessary to warm and ventilate the entire building.

The increasing use of impervious materials for walls and floors of assembly halls and corridors lessens the work and expense of cleaning. In some instances the public portions of the stairs and corridors may be chained off to limit the areas accessible to evening gatherings, thus minimizing service, but it is now a recognized demand, usually complied with, that the public rooms shall have separate public entrances. This removes all opportunity for entrance into unused portions during the evening.

One may observe today in many localities school buildings embracing assembly halls with stages large enough and adequately equipped for amateur or professional dramatics, for choral work, for lectures, including stereopticon illustration, and for physical culture exhibitions. One may also see branch libraries with separate entrances and arrangements for school and neighborhood uses of all kinds. These features, with the double gymnasiums and natatoriums mentioned above, constitute most, if not all, of the elements already developed and used in response to the social center idea and the enlarged educational outlook up to the present time. One cannot help observing that the influence of the social center is not limited to the "out-of-hour" periods and to the adults, but that it also broadens and deepens the daytime work for the school children as well.

What, then, shall we say of the influences now at work and of the effects they will produce?

First, what are those influences? What is it that the social center idea demands? Upon what assumptions is that idea based? The basic assumption, I believe, is that education does not cease on commencement day; that it is a never-ending process and the so-called school of life may be augmented vastly by continuing its partnership with the established educational institution to the end. Also, that the full education of the child demands co-operation and interested acquaintance with the school on the part of the parents and, as embracing all of these, that no community can rise to its greatest possible development without that experience, in realized and applied democracy, which seizes upon the school as the natural and proper instrument for its educational, social, and recreational functions.

Those functions are, in fact, the ones upon which the permanence and growth of our political and economic freedom depend. The social center idea is, therefore, the movement to acquire the proper conditions for community life. The influences or effects of that idea are felt not only in the school, but in every portion of our civic life, and a study of them may help us to perceive their future course.

We will observe these influences:

First: In the enlarged uses of existing schools, already referred to.

Second: In our parks, playgrounds, and bathing-beaches, and the buildings therein.

Third: In the numerous organized efforts at social betterment, known as settlements, such as Hull House, the Commons, the University of Chicago Settlement, and a dozen others in Chicago, and buildings for similar purposes in every large city in the United States.

Fourth: In the buildings of commerce and industry where one's time is spent after leaving school in activities to which school work is becoming more and closely related.

Fifth: In the Y.M.C.A.'s, the association buildings, and clubs of all kinds.

These have all sprung from social demands and in most cases are free from the dictation of unrelated tradition. From all of these the educator and his architect must learn. We have become accustomed to saying, with John Dewey, that education is life and that we learn by doing, but we seem unaware that the same principle applies in architecture, and that in schools, more than in any other class of buildings, it is imperative that one be governed by principle rather than tradition, that needs should govern structure and form.

It must be admitted that the park, library, and settlement boards have blazed the trail which boards of education must follow, for all must unite to establish all these efforts on a firm economic basis by wise co-ordination of public agencies. Why should one of my dollars be spent by a park board, another by a library board, still another by a school board, and a fourth contributed more or less understandingly to be spent by a settlement board, when all four are for the same essential purpose and could be administered to double or treble the advantage if done by one agency, according to one plan in one group of buildings arranged to avoid wasteful duplication of construction and maintenance?

We need to understand that the newly devised systems of scientific management of private business apply equally well to civic and social affairs. When can such waste of money, and the waste of the more precious time of people, young and old, be stopped? Not until the educators apply in their buildings what they are already applying in their teachings. Not until in their buildings, as well as in their teachings, they prepare and arrange for all phases of life, will proper organization of the numerous separate and wasteful agencies take place. Wise consolidation would conserve the public resource which is ample for all our needs, if waste be eliminated and increased efficiency be secured.

The influence of social centers is toward the promotion of such consolidation. That influence is now operative; it responds to a social hunger which is as real as bodily hunger, altho it may not be named and labeled. It has already begun to show itself in some of our high schools where the various educational activities are housed in separate buildings, capable of separate opening and use, but connected with each other by covered corridors and in buildings separated sufficiently to remove interference by one with another part, but where all are grouped around one central or academic portion.

This educational, social idea has shown its progress in the construction of gymnasiums and swimming-pools which are intended for public use at all periods of the year, not interfering with student use, particularly in summer, when the classrooms are closed. It has also found expression in the small lecture-room where "high-school extension" work, similar to university extension, can be carried on, and in rooms for clubs, societies, and organizations of minors and adults.

But of the future—what is to be the influence of social centers in our schools?

First: It will demand and ultimately produce a real solution of present-day problems still unsettled; that is, it will cause a system of lighting that shall protect the eyes without the loss of architectural effect or interior finish.

Second: It will demand real ventilation with humidity and not too much heat, repeating more nearly than we now think possible the conditions of out-of-doors.

Third: Sanitation, ease of cleaning, must be accomplished. Impervious floors, now common in corridors, must be introduced into the classrooms. The dirt-holding maple floor, with its countless joints, must go, to be replaced by a floor with the qualities of asphalt, plus good color. This will make the usual fixed seats impractical and cause a substitution of portable school seats and desks. The result will be greater sanitation and greater flexibility for varied uses as well. The fixed seat must go.

Fourth: Fireproof conditions are assumed—that requirement does not need restatement, but it should carry with it impervious wall surfaces as well, for sanitary reasons. These can be built and colored so as to satisfy æsthetic and homelike desires.

Fifth: More land will be required and provided. Most of our problems can be solved by appropriating more land. Land for light, land for air, land for play, land for beauty, land for changes, land for growth, and land for lower buildings.

The one-story top-lighted school has already been built. It is being repeated. The cottage unit, properly grouped, must come. The large, forbidding, overpowering institution must go. The unfortunate classes now have the advantages of the cottage plan. Why should the advantage not be enjoyed by the normal child as well as the — I was going to say bad one, but instead I will say the uneducated child?

Sixth: Schools are located in all residence districts as close to houses as possible. This is merely for convenience. Today country schools for city children are not feasible, but with increased transportation facilities properly safeguarded, what is the reason that our children cannot be taken to the country daily for schooling? This is not altogether new. In a certain school in Denmark they have been doing it for forty years or more. The children study one-third the time, work one-third, and play one-third, and enjoy life all the time.

One of Chicago's most valuable public-spirited citizens was brought up in this particular school and does honor to the system there employed.

The land question will not be so difficult under such a scheme. Remote schools do not conflict with the social center idea. The word "center" is not be taken in a geographical sense, but instead, in a human sense.

Seventh: The idea will ultimately compel schools with smaller units but more of them in one group. Ultimately separate high schools—except for specialized technical training—will disappear to be replaced by schools built for twelve or thirteen grades instead of eight or nine. Instance, the normal school at Normal, Ill., where this idea is already being built.

Eighth: I am optimistic enough to believe that when the public demands such schools as these it will have become so intelligent that it will no longer permit architects to inflict designs executed in old, dead, and inappropriate styles; that eventually the imperialism of Rome and the debasing sham of American galvanized-iron imitations of Rome will be rejected to be replaced by a style at once direct, honest, modest, sensible, enduring, and beautiful. Then, and not till then, can we consistently preach these manly and womanly virtues to students, for until then the influence of sham and vulgarity in buildings will make itself felt above our words.

If it were in my province, I should like to speak of the political changes which will result from such growth. If the schools train citizens from the beginning with such facilities, there will be a vastly better supply of men and women for social offices. As has been frequently said, the only cure for bad politics is more politics, and I welcome the day when all the functions herein hinted at are added to government.

It will then be everyone's unavoidable duty to become an active citizen. We need not fear sudden change. We know that all growth is gradual. We need only tend in the right direction, and society will do its part.

Our part is to build properly—to build what we do build so that changes and additions can be economically and conveniently made, as conditions develop. By so doing, we shall give to the teachers an instrument of service, making possible the greatest development of the individual for himself and for society. By so doing we shall give heed to the indisputable message now proclaimed by social centers and will demonstrate the true relation of schoolhouse architecture to the social center movement.

C. THE PUBLIC LIBRARY, THE PUBLIC SCHOOL, AND THE SOCIAL CENTER MOVEMENT

ARTHUR E. BOSTWICK, LIBRARIAN, PUBLIC LIBRARY, ST. LOUIS, MO.

The center of a geometrical figure is important, not for its size and content, but for its position—not for what it is in itself, but for its relations to the other elements of the figure. And words used with derived meanings are used best when their original significations are kept in mind. The business center of a city does not contain all of that city's commercial activity; when we speak of the church as a religious center, we do not mean that there is to be no religious activity in the home or in other walks of life; as for the center of population of a large and populous country, it may be out in the prairie where neither man nor his dwellings are to be seen. All these centers are what they are because of certain relationships. It is so with a social center. But social relationships cover a wide field. The relationships of business, of religion, even of mere coexistence, are all social. May we have a center for so wide a range of activities? Even the narrower relations of business or of religion tend to form subsidiary groups and to multiply subsidiary centers. In a large city we may have not only a general business center but centers of the real estate business, of the hardware or textile trades, and so on. Our religious affiliations condense into denominational centers.

In the district of a large city where newly arrived foreign immigrants gather, you will be shown the group of blocks where the Poles or the Hungarians have segregated themselves from the rest, and even within these, the houses where dwell families from a particular province or even from one definite city or village. Man is social, but he is socially clannish, and the broadest is not so much he who refuses to recognize these clan or caste relationships as he who enters into the largest number of them—he who keeps in touch with his childhood home, has a wide acquaintance among those of his own religious faith and of his chosen business or profession, keeps up his old college friendships, is interested in collecting coins or paintings and knows all the other collectors, is active in civic and charitable societies, takes an interest in education and educators, and so on. The social democracy that should succeed in abolishing all these groups or leveling them—that should recognize no relationships but the broader ones that underly all human effort and feeling—the touches of nature that make the whole world kin—would be barren indeed.

We cannot spare these fundamentals; we could not get rid of them if we would; but civilization advances by building upon them, and to do away with these additions would be like destroying a city to get at its foundations, in the vain hope of securing some wide-reaching result in economics or æsthetics. Occupying a foremost place among these groupings is the large division embracing our educational activities. And these are social

not only in the broad sense, but also in the narrower. The intercourse of student with student in the school and even of reader with reader in the library, especially in such departments as the children's room, is so obviously that of society that we need dwell on it no further.

This intercourse, while a necessary incident of education in the mass, is only an incident. It is sufficiently obtrusive, however, to make it evident that any use of school or library building for social purposes is fit and proper. There is absolutely nothing new nor strange about such use. In places that cannot afford separate buildings for these purposes, the same edifice has often served for church, schoolhouse, public library, and as assembly room for political meetings, amateur theatricals, and juvenile debating societies. The propriety of all this has never been questioned and it is difficult to see why it should not be as proper in a town of 500,000 inhabitants as in one of 500. The incidence of the cost is a matter of detail. Why should such purely social use of these educational buildings—always common in small towns—have been allowed to fall into abeyance in the larger ones? It is hard to say; but with the recent great improvements in construction, the building of schools and libraries that are models of beauty, comfort, and convenience, there has arisen a not unnatural feeling in the public that all this public property should be put to fuller use. Why should children be forced to dance on the street or in some place of sordid association when comfortable and convenient halls in library or school are closed and unoccupied? Why should the local debating club, the mothers' meeting—nay, why should the political ward meeting be barred out? Side by side with this trend of public opinion there has been an awakening realization on the part of many connected with these institutions that they themselves might benefit by such extended use.

Probably this realization has come earlier and more fully to the library, because its educational function is directed so much more upon adults. The library is coming to be our great continuation school—an institution of learning with an infinity of purely optional courses. It may open its doors to any form of adult social activity.

There are forms of activity proper to a social center that require special apparatus or equipment. These may be furnished in a building erected for the purpose, as are the Chicago fieldhouses. Here we have swimming-pools, gymnasiums for men and for women, and all the rest of it. A branch library is included and some would house the school also under the same roof. We may have to wait long for the general adoption of such a composite social center. Our immediate problem is to supply an immediate need by using means directly at our disposal. And it is remarkable how many kinds of neighborhood activity may take place in a room unprovided with any special equipment. A brief glance over our own records for only a few months past enables me to classify them roughly as athletic or out-

door, purely social, educational, debating, political, labor, musical, religious, charitable or civic, and expository, besides many that defy or elude classification.

The athletic or outdoor organizations include the various turning or gymnastic clubs and the Boy and Girl Scouts; the social organizations embrace dancing-classes, "welfare" associations, alumni and graduate clubs of schools and colleges, and dramatic clubs; the educational, which are very numerous, reading circles, literary clubs galore, free classes in chemistry, French, psychology, philosophy, etc., and all such organizations as the Jewish Culture Club, the Young People's Ethical Society, the Longan Parliamentary Class, and the Industrial and Business Women's Educational leagues. Religious bodies are parish meetings, committees of mission boards, and such organizations as the Theosophical Society; charitable or civic activities include the National Conference of Day Nurseries, the Central Council of Civic Agencies, the W.C.T.U., playground rehearsals for the Child Welfare Exhibit, and the Business Men's Association, and the Advertising Men's League; musical organizations embrace St. Paul's Musical Assembly, the Tuesday Choral Club, etc. Among exhibitions are local affairs such as wildflower shows, an exhibit of birdhouses, collections from the Educational Museum, the Civic League's Municipal Exhibit, selected screens from the Child Welfare Exhibit, and the prize-winners from the St. Louis Art Exhibit held in the art room of our central library. Then we have the Queen Hedwig Branch, the Clay School Picnic Association, the Aero Club, the Lithuanian Club, the Philotechne Club, the Fathers' Club, and the United Spanish War Veterans.

I trust you will not call upon me to explain the objects of some of these, as such a demand might cause me embarrassment—not because their aims are unworthy, but because these are skillfully obscured by their names. If anyone believes that there is a limit to the capacity of the human race for forming groups and subgroups on a moment's notice, for any reason or for no reason at all, I would refer him to our assembly room and clubroom records; and he would find, I think, that these are typical of every large library offering the use of such rooms somewhat freely.

It will be noted that the library takes no part in organizing or operating any of these activities; it does not have to do so.

The successful leader is he who repairs to a hill and raises his standard, knowing that at sight of it followers will flock around him. When you drop a tiny crystal into a solution, the atoms all rush to it naturally: there is no effort or compulsion except that of the aptitudes that their Creator has implanted in them. So it is with all centers, business or religious or social. No one instituted a campaign to locate the business center of a city at precisely such a square or corner. Things aggregate, and the point

to which they tend is their center; they make it, it does not make them. The leader on a hill is a leader because he has followers; without them he would be but a lone warrior. The school or the library that says proudly to itself, "Go to; I will be a social center," may find itself in the same lonely position. It can offer an opportunity: that is all. It can offer houseroom to clubs, organizations, and groups of all kinds, whether permanent or temporary, large or small, but its usefulness as a social center depends largely on the existence of these and on their desire for a meeting-place. We have in St. Louis six branch libraries with assembly rooms and clubrooms—in all a dozen or so. I have before me the calendar for a single week and I find 55 engagements, running from 24 at one branch down thru 13, 8, 6, and 3 to one. If I had before me only the largest number I should conclude that branch libraries as social centers were a howling success; if only the smallest, I should say that they were dismal failures. Why the difference? For the same reason that the leader who displays his standard may or may not be surrounded with eager "flocking" followers. There may be no one within earshot, or they may have no stomach for the war, or they may not be interested in the cause that he represents. Or again, he may not shout loud or persuasively enough, or his standard may not be attractive enough in form or color, or mounted on a sufficiently high staff.

I have said that all we can offer is opportunity; to change our figure, we can furnish the drinking-fountain—thirst must bring the horse to it. But we must not forget that we offer our opportunity in vain unless we are sure that everyone who might grasp it realizes our offer and what it means.

Here is the chance for personal endeavor. If the young people in a neighborhood continue to hold their social meetings over a saloon when the branch library or the school is perfectly willing to offer its assembly room, it is pretty certain that they do not understand that offer, or that they mistrust its sincerity, or that there is something wrong that might be remedied by personal effort. In the one of our branches that is most used by organizations there is this personal touch. But I should hesitate to say that the others do not have it too. There are plenty of organizations near this busiest library and there are no other good places for them to meet. In the neighborhood of some other branches there are other meeting-places, and elsewhere, perhaps, the social instinct is not so strong, or at any rate the effort to organize is lacking. Should the librarian step out and attempt to stimulate this social instinct and to guide this organizing effort? There is room for difference of opinion here.

Personally I think that he should not do it directly and officially as a librarian. He may do it quietly and unobtrusively like any other private citizen, but he needs all his efforts, all his influence, to bring the book and the reader together in his community. Sometimes by doing this he can be doing the other too, and he can always do it vicariously. He should

bear in mind that the successful man is not he who does everything himself, but he who can induce others to do things—to do them in his way and to direct them toward his ends. Even in the most sluggish, the most indifferent community there are these potential workers with enthusiasms that need only to be awakened to be let loose for good. The magic key is often in the librarian's girdle, and his free offer of house room and sympathy, with good literature thrown in, will always be of powerful assistance in this kind of effort. He will seldom need to do more than to make clear the existence and the nature of the opportunity that he offers. I know that there are some librarians and many more teachers who hesitate to open their doors in any such way as this; who are afraid that the opportunities offered will be misused or that the activities so sheltered will be misjudged by the public. It has shocked some persons that a young people's dancing-class has been held, under irreproachable auspices, in one of our branch libraries; others have been grieved to see that political ward meetings have taken place in them, and that some rather radical political theories have been debated there. These persons forget that a library never takes sides. It places on its shelves books on the Civil War from the standpoint of both North and South, histories of the great religious controversies by both Catholics and Protestants, ideas and theories in science and philosophy from all sides and at all angles. It may give room at one time to a young people's dancing-class and at another to a meeting of persons who condemn dancing. Its walls may echo one day to the praises of our tariff system and on another to fierce denunciations of it.

These things are all legitimate and it is better that they should take place in a library or a school building than in a saloon or even in a grocery store. The influence of environment is gently pervasive. I may be wrong, but I cannot help thinking that it is easier to be a gentleman in a library, whether in social meeting or in political debate, than it is in some other places. In one of our branches there meets a club of men who would be termed anarchists by some people. The branch librarian assures me that the brand of anarchism that they profess has grown perceptibly milder since they have met in the library. It is getting to be literary, academic, philosophic. Nourished in a saloon, with a little injudicious repression, it might perhaps have borne fruit of bombs and dynamite.

In this catholicity I cannot help thinking that the library as an educational institution is a step ahead of the school. Most teachers would resent the imputation of partisanship on the part of the school, and yet it is surely partisan—in some ways rightly and inevitably so. One cannot well explain both sides of any question to a child of six and leave its decision to his judgment. This is obvious; and yet I cannot help thinking that there is one-sided teaching of children who are at least old enough to know that there is another side, and that the one-sided teaching of two-sided

subjects might be postponed in some cases until two-sided information would be possible and proper. Where a child is taught one side and finds out later that there is another, his resentment is apt to be bitter; it spoils the educational effect of much that he was taught and injures the influence of the institution that taught him. My resentment is still strong against the teaching that hid from me the southern viewpoint concerning slavery and secession, the Catholic viewpoint of what we Protestants call the Reformation—dozens of things omitted from textbooks on dozens of subjects because they did not happen to meet the approval of the textbook compiler. I am no less an opponent of slavery—I am no less a Protestant—because I know the other side, but I think I am a better man for knowing it, and I think it a thousand pities that there are thousands of our fellow-citizens, on all sides of all possible lines, from whom our educative processes have hid even the fact that there is another side. This question, as I have said, does not affect the library, and fortunately need not affect it. And as we are necessarily two-sided in our book material so we can open our doors to free social or neighborhood use without bothering our heads about whether the users are Catholics, Protestants, or Jews; Democrats, Republicans, or Socialists; Christian Scientists or suffragists. The library hands out suffrage and anti-suffrage literature to its users with the same smile, and if it hands the anti-suffrage books to the suffragist, and vice versa, both sides are certainly the better for it.

I have tried to make it clear in what I have said that in this matter of social activity, public institutions should go as far as they can in furnishing facilities without taking upon themselves the burden of administration. I believe fully in municipal ownership of all kinds of utilities, but rarely in municipal operation. Municipal ownership safeguards the city, and private or corporate operation avoids the numerous objections to close municipal control of detail. So the library authorities may retain sufficient control of these social activities by the power that they have of admitting them to the parts of the buildings provided for them, or of excluding them at any time. The activities themselves are better managed by voluntary bodies, and, as I have said, there is no indication that the formation of such bodies is on the wane. The establishment and operation of a musical or athletic club, a debating society, or a Boy Scouts company, are surely quite as educational as the activities themselves in which their members engage. Do not let us arrogate to ourselves such opportunities as these. I should be inclined to take this attitude also with regard to the public playgrounds, were they not somewhat without the province of this paper; and I take it very strongly with regard to the public school. Throw open the school buildings as soon as you can, and as freely as you can, to every legitimate form of social activity, but let your relationship to this activity be like that of the center to the circle—in it and of it, but embracing no part of its areal content. So, I am convinced, will it be best for all of us—

for ourselves, the administrators of public property, and for the public, the owning body which is now demanding that it shall not be barred out by its servants from that property's freest and fullest use.

D. THE ORGANIZATION AND ADMINISTRATION OF RECREATION AND SOCIAL CENTER WORK

ERICH C. STERN, MEMBER OF STATE LEGISLATURE, MILWAUKEE, WIS.

There has of late been a marked development in a variety of tendencies, familiar to this audience, all seeming to converge toward what is here called the movement for recreational, social, and civic opportunity.

There is, for example, the tendency, upon purely economic grounds, toward a more extended and continuous use of the school plant. People realize that it is poor economy to allow this very expensive system of buildings and play places to stand idle so much of the time.

Again, there is a growing demand for the very facilities which the school plant furnishes. Revived ideals of neighborliness, a new social conscience, the sense of the shame of our cities, stimulate community action thru civic clubs. The need of a neighborhood hearth, so to speak, finds the deserted school buildings and raps for admission.

From within the schools themselves comes a demand for their wider use, arising from a broadened conception of their social responsibilities. Manual training, gymnastics, cooking, gardening, and well-equipped playgrounds bear witness to this broader conception, as do also the evening and vacation schools, and more lately the trade and vocational training schools.

Many of these demands for a more thoro exploitation of the school plant are embraced in another great movement, whose aim is the establishment of social centers, with emphasis upon supervised play and pure recreation.

Apart from the school-realm proper there are kindred factors of great significance. Foremost among these is the National Playground and Recreation Association. This association teaches the need of wisely directed play and recreation, which must be "educational, and yet without any suggestion of the organization or atmosphere of the school."

Another related tendency is found in the increase of municipal functions. In addition to parks and playgrounds, cities are called upon to furnish natatoria, bathing-beaches, outdoor gymnasia, recreation buildings, and neighborhood centers, and to arrange popular entertainment for Independence Day and other holidays in order to render their observance more "sane" and attractive, while libraries are reaching out by means of branches and are actively seeking patronage.

Now all these tendencies are factors in the movement for recreational,

social, and civic opportunity. Hence to unify this movement for purposes of systematic administration, all these factors must be taken into account and their common characteristics discovered. At once it is plain that all these matters have to do with education. Altho public recreation must not be paralyzed by formal education, neither must it be confounded with haphazard play. It is to be educational recreation. In the next place we are struck with the fact that these tendencies are very largely focused upon the school plant which furnishes the greatest facilities ready at hand. Many do not appreciate the full truth of this because they fail to see in the traditional education and old type of schoolhouse any susceptibility for expansion and readaptation. The movement for public recreation is really a movement to make education overflow its previous bounds, both theoretical and physical, and, without disturbing the kernel of formal instruction, to give its beneficent powers a wide scope.

Thus far the component factors of the recreation movement have not been unified, but have been advocated as separate causes by individuals and associations that have led the advance in their respective communities. It was the period of experimentation and of propaganda thru private initiative. But gradually, out of the confusion of many impulses, the sense of relationship has emerged and citizens generally have come up with the leaders. Hence the demand that these related matters be systematically co-ordinated, and taken over and carried on by some regularly constituted municipal authority.

The problem therefore is, What shall this authority be? Shall it be a new and separate agency, or shall it be an already existing department?

The plan for an independent branch of government to carry on this work has many able advocates. It is felt by them that the subject of public recreation is not only of enough importance to be placed under a separate board, but that it is so distinct from other community interests that no existing board can safely be intrusted with its development and administration. This has notably been the tendency where the approach to the recreation movement has been thru the playground rather than thru the school. Hence in many cities the voluntary playground associations of earlier days have been given the dignity of recreation commissions under municipal sanction. An independent board undoubtedly has certain advantages, particularly during the developing period. And such a board is absolutely necessary where existing agencies show a lack of hospitality to the newer functions which may still prove to be properly theirs.

Nevertheless, the commission form of control is open to certain weighty objections, especially if we assume that the period of propaganda and surveys has passed, and the time arrived for a logical, efficient, and permanent method of administration. Americans have become prodigal of commissions. They are born of enthusiasm but soon languish because of inefficiency. They may be very useful to draw attention to a new idea, but

usually fail to develop it. Of course this does not apply to the well-paid expert commissions of modern government, with well-defined duties and large responsibilities. But irresponsible, unpaid boards of "leading citizens" too often prove ephemeral and lacking in the power of sustained effort. And, besides, their multiplication tends toward undesirable confusion of governmental machinery.

Another strong objection to the recreation commission, as a permanent device, follows from the wrong assumption that recreation is a distinct municipal function. Recreation is doubly related to other functions such as the schools, the parks, the libraries. It is related to them, first, in that it proposes to liberalize them, and further because it has to use their facilities. It has almost no tools apart from theirs. Nearly all recreational facilities which our cities have, or are likely to have, are found in connection with the school plant, the park system, the streets, and existing public buildings, all of which are under the jurisdiction of their respective boards. On account of this double relationship, recreation commissions would inevitably entail division of authority between themselves and these other boards; not necessarily hostile conflict, but most certainly ample opportunity for friction, and a dissipation of responsibility which is not favorable to efficient administration.

Another aspect of the problem which casts doubt upon the expediency of a separate department is to be found in the mere size of the administrative machinery required. The fully developed system of recreation will be ubiquitous and coextensive with the boundaries of the cities. To start even a single playground properly you must have a trained supervisor. For a vast system of playgrounds, you will not only need a large number of such experts, but you must have the whole hierarchy of employees, with all the machinery for their fit selection, consisting of a central office force, superintendent, secretary, directors, teachers, and a host of more or less skilled subordinates, down to the caretakers of the grounds and shelters. Now add to this the recreational activities in the parks and streets and within the schools and other public buildings, and it becomes apparent that systematic recreation requires administrative machinery of great magnitude and complexity, comparable with no other department save that under the board of education. But that department has the necessary organization. Would the duplication of this machinery be justified?

If the plan of a separate department be rejected, the next question is, Which of the existing agencies of city government is the logical one to undertake the administration of systematic recreation? Everything that has already been said clearly points to the board of education. It appears that the problem is essentially bound up with education; that the requirements call for extensive and costly facilities and for highly organized administrative machinery. Not only does the school plant extend into

every neighborhood and offer the greatest opportunity for supplying recreation, but in many cities it is now used for this purpose, and in many more the same thing is urged. As for the administrative feature, the school department already has such various subdivisions as music, gymnastics, truancy, medical inspection, manual training, etc. It would be quite simple to add a division for recreation and social centers. With a really worthy supervisor at the head of this division, having at his disposal adequate funds, no reason is perceived why the new work would not thus be most satisfactorily advanced.

On behalf of a separate board it is often argued that, since its sole interest would lie in recreation, it would further this cause with singleness of purpose. But it is to be observed that an even greater concentration of duties would result from the appointment, by an enlightened school board, of a supervisor of recreation. And in addition the supervisor, being a paid expert, would give promise of more continuity of purpose than a commission, while the whole organization of the education department would imply a guaranty of efficiency.

The fact is that, whether or not you have a recreation commission, the schoolhouses and adjacent playgrounds are going to be greatly modified so as to meet the new demands made upon them. When school boards themselves come to take a broader view of their functions, as they inevitably must, they will not permanently tolerate a division of jurisdiction in their domain. Consequently the establishment of a separate board would after all not succeed in finally co-ordinating all recreational activities.

Thru the school board and its supervisor of recreation complete co-ordination in this field can, it is believed, be attained. All playgrounds outside the parks and many other recreational facilities could safely be turned over entirely to such an official. In other cases the matter would have to be left to mutual arrangement between the school boards and other boards. This, to be sure, would still leave some division of authority; but it would be reduced to a minimum, and, being based upon logical grounds, would not often give rise to friction. The average park board, for example, realizes that it has neither the equipment nor the means to carry on quasi-educational work, and will be glad to be relieved of such a burden. The school board, on the other hand, has both the functional and administrative requirements, and its wonderful system of buildings and playgrounds is the very fulcrum of the recreation movement. In its case the question is only one of rising to the occasion.

It is by no means the purpose here to dogmatize. The desire is merely to make some general suggestions based upon an analysis of the recreation movement. Until the separate factors of the movement have been fused thru a realization of their common purpose, their development should be naturally determined by local conditions. Every impulse in the right direction should be gratefully accepted, whether it leads to the establish-

ment of a playground, a social center, or a new city plan. Nevertheless it will aid thoughtful citizens in wisely directing and molding these tendencies to appreciate their inner meaning and the conditions of the problem as a whole. It will prevent them from confounding temporary expedients with permanent organization and administration.

To educational authorities the recreation movement appears to present both a warning and an opportunity. The warning is to be found in a report by an able committee upon this very subject which says that a recreation commission is to be preferred, because school boards lack social insight and cannot appreciate at their real values such phases as hygiene, exercise, pleasure, and informality. Without mental alertness, school boards will soon awake to find the fields of education doubled and trebled, but themselves not partaking of the new pastures. The opportunity which the situation presents to school authorities lies in the chance of assuming the leadership in a new movement of very large significance. Should they do so, formal education will not suffer but will, on the contrary, by reason of broader contacts, be vitalized and dignified.

E. THE SOCIAL CENTER AND THE RURAL COMMUNITY

HERBERT QUICK, EDITOR OF "FARM AND FIRESIDE," SPRINGFIELD, OHIO

The conscious demand for organized social centers is a thing of recent growth. Like most conscious social demands, it springs from a need too long left unfilled. Those of us who feel the call to action in this new cause should if possible formulate to our own minds the need to be met.

The movement has been most vigorous in certain cities. It has taken in some places the form of entertainment courses, closer to the community than the theater or the Y.M.C.A. or the ministrations of the lecture platform. It has thus been urged as a means of bringing literature and art into the neighborhood. But I think it would be a mistake to identify the social center movement with entertainment only.

In other places and at other times it has assumed the phase of offering to neighborhoods dances and social functions of a more local character and a more unobjectionable sort than the similar affairs offered for profit by individual promoters. But I feel sure that the movement means more than social intercourse and amusement.

On other occasions it has sought to bring the people together for the discussion and consideration of sociological and political questions, and for debates and literary exercises. This has been successful in stimulating the citizenship to more active participation in public affairs. But the social center means much more than this, I feel sure. Entertainment, amusement, social functions, political and sociological discussion and debate—these all belong in the picture; but there is an underlying psychological

demand which appears in all these functions and dominates them all. That demand is, in my opinion, the feeling running all thru society that the common, ordinary citizen must learn to co-operate with his fellows as a means of fostering the common good. And when we come to consider the social center as related to the rural community, if the treatment is not to take us outside the field of the social center as ordinarily conceived, we must keep in mind the basis of the movement, the need for co-operative action in neighborhoods.

We are all familiar with the fact that as the nation grows older the people seem in some way to become less homogeneous. The neighborhood fellowship which seems to prevail in European neighborhoods is the outgrowth of the ages. The country community which Hardy limns in his Wessex parishes, or which Blackmore describes to us on Exmoor, or Scott in the lands north of the Tweed seem to possess a neighborhood solidarity altogether lacking in most American communities. We have thought that this neighborship, needing centuries for its growth, might be expected in America as a flower which time will cause to bloom. But American life seems to tend otherwise. In New England where the historic perspective is longest neighborship seems to be weakening as the years pass. The social relations in rural communities in most parts of the Middle West are not as close as in the pioneer times when anyone was a neighbor who lived within ten miles, and the necessity of each leaning on the other in the struggle with nature pressed upon everyone, and there was a felt need for the making of new friends in the new environment. The telephone may bring people closer together, but the trolley, the motor car, the daily mail, and the increasing number of friends which the average farm family has in town, all, with many other factors, take the place of neighborship and tend to community individualism rather than neighborhood collectivism. Thus we are forced to the conclusion that as yet none of the influences which have built up neighborhood groups in older nations are at work here. We are justified in believing that inasmuch as American life is growing up with no feudal and mediæval background such influences will never come into existence. And a close study of European rural life leads to the conclusion that the older rural groups are not of the sort which we should desire if we could have them, picturesque as they are in literature; and that the superiority which the European farmer exhibits as compared with the American farmer in the matter of rural organization is owing, not to historic factors, but to developments which have sprung from conditions of the last decades of the nineteenth century, and from the early years of the twentieth. The Danish peasant is doing better than the American farmer in this respect, not because he is old fashioned, but because he is up to date. The splendid achievements of the Irish farmers in co-operation, and the enormous successes of the peasants of Italy, Germany, and France, in co-operative banking come from the new life and not from the old. Everywhere, the new

wine is being poured into new bottles, instead of the ancient vessels. The new movements in rural life spell democracy, not privilege.

Rural communities need to get together; but the American farmer is too much of a utilitarian to yield to the attraction of amusement for its own sake, or offered culture, or debates, or lectures. He is hard headed and rather cynical about new things. Companionship with his fellows may be needed, but the need is not fully confessed nor keenly felt. He is rather single-minded in his pursuit of profit in the material sense. Like all self-respecting people he objects to the process of being "uplifted" by people who take a position above him. If social centers are to succeed in the rural community, their success must come thru their ability to serve the farmer and the farmer's wife along the lines of thought and endeavor which appeal to him.

For these reasons the church does not seem able to furnish the nucleus of the rural social center save in rare instances. Here and there, the rural church is doing good work in building up again the lost sense of neighborship; but on the whole churches are losing ground in the country. One of the gravest problems which confronts the churches is the problem of the ebb-tide which is leaving stranded and abandoned churches on so many countrysides. Moreover, the church cannot do the whole work. Many people do not belong to any church. Those who do belong are divided among many denominations, which, if not warring on each other, are not co-operating, and are in no position to co-operate. The church cannot call in aid the powers of taxation, nor the assistance of the state. It may be *a* social center for the community, but it can never be, and should not be, *the* social center.

The neighborhood club and the co-operative organization are doing good work in places. Women's clubs have worked great changes in some rural neighborhoods. I know of some places where clubs of farmers' wives have kept up for many years successful meetings of a character very similar to the gatherings of people interested in literature, current events, and music in cities. Some of these communities are admirably served by these clubs. But on the whole I feel that there is less of this social activity than there was thirty years ago. The clubs are better, perhaps, than were the old spelling-schools and "literaries," but they are vastly fewer. The need for social centers everywhere, as a potent force in American life as universal as the practice of agriculture, has no hope in these. The communities that most need awakening are incapable of finding utility or amusement in these rather sophisticated and "highbrowish" affairs. Something more elemental and elementary, more useful and more profitable materially must appear.

Along with this demand for rural centers comes the admitted need for a new kind of rural school. The rural school of today is apt to be in the main a bad copy of a poor city school. It is not related to the country

life. It proceeds as if on the theory that farmers' sons should all become clerks or professional men engaged in urban employment and all country girls stenographers, shopgirls, factory employees, or the wives of such city-dwellers. This bias of the rural school against rural life is the one great scholastic blunder of this nation. It has acted as a powerful wind blowing the selfsame way with the baneful tide of allurement and economic pressure which has been for so many fateful years, and still is, emptying the farms into the cities.

Our eyes are becoming opened to the destruction which such schools work on our national life. The word has gone forth that the rural school must be ruralized. It must be correlated with rural life. It must open the eyes of the country children to the beauties of that field of nature in which the farmer acts with, and is reacted upon, by scientific truth. Our arithmetic must deal with the quantities of soil constituents, farm inventories, eggs, poultry, cow-testing, and generally with the computation of problems related to scientific agriculture. Every problem in mathematics must be a problem in scientific rural life. Our nature-studies must deal no more with the koodoo, the mongoose, the toucan, and the aard-vark, but rather with the cow, the hen, the hog, the horse, and the sheep. Our physiologies must abandon the useless anatomies and terminologies of yesterday, and become comparative. The physiology of the domestic animals must be considered with that of the human being to the end that we shall know our animals while knowing ourselves, and each the better for knowing the other; and our hygiene must take in the nutrition of these friends of the barnyard and pasture. Thus the rural school shall become a school of animal husbandry. Geography must so far include the study of soils that the child may know of the plant food in his father's farm, whether he knows the capital of his state or not. Reading and spelling must be related to the life of the farm. History must tell of the movements of agriculture, rather than of battles or political contests. Pupils will do their language work in reporting the results of experiments in farming, rather than in the diagramming of sentences or the parsing of words. And where such work in systematic grammar is done, the sentences chosen will be such as to possess a background in the real life of the pupils, rather than in mythology or the classics. The school will be completely ruralized.

And in this process the cultural efficiency of the schools will be increased tenfold, because the children will not only imbibe ideas, but will use them. The dreadful uselessness of most of our purely "cultural" studies lies in the feeling on the part of the child that the whole matter is in an unreal world of school and quite aside from the world of life. When the rural schools become real laboratories of farm life, when the boys and girls study in the schools the very things their parents are laboring with on the farm, the habit of thinking about things rather than about words will give vigor to every phase of thought. If I desired to produce a generation of poets,

artists, mathematicians, and statesmen, I would begin by giving to the minds of the young the real grain of scientific truth to grind, trusting to the insatiable hunger of the mind which grows by every morsel of truth consumed by it. I once saw in one of these new rural schools a boy sitting with a rack of agricultural bulletins at his elbow, writing on raspberry culture. I asked him why he chose that topic for his essay. "I'm growing raspberries for the market," said he. Language for this boy was a medium for expressing thought, rather than for getting marks. He was interested in the essay, but more in next year's crates of berries. Out of such conditions will come pupils who will make the language glow with meaning, as do Caesar's *Commentaries* and Grant's *Memoirs*—and for the identical reason that gives immortality to these works as literature. In each case the writer will have something to say.

Out of this new kind of country school, I believe, will grow the new kind of rural social center. Already the Babcock milk-tester, the weed cabinet, the trap nest, the experimental plat of grain, vegetable, or flower are to be seen in and about the rural school. Wherever these schools are correlated with rural life, the social center springs up in the school spontaneously. I am convinced that if it is to live and serve it must so spring up. A farmer in Page County, Iowa, was rather opposed to the new-fangled notion of teaching agriculture in the school. But after the milk of his cows had been tested in the school, as a part of its regular exercises, he changed his mind. For by this test he discovered that cows which he had thought as good as any were actually being kept at a loss. The simple classroom experiment in natural philosophy had made it possible for this family to live a fuller and happier life. The school reacted on the home, and the home felt it. To this man, the school became as much a part of his life as it had been of the life of his children. The correlated rural school thus becomes a continuation school for every man in the district. And for every woman, too. The girls who compete in the cooking and sewing contests bring their mothers into the work of the schoolroom inevitably. A link is established connecting every farm with every other farm, and binding them all together. A social center comes into being with or without meetings. But the meetings are inevitable, and with the fact of meetings come social relations, debates, lectures, moving-picture shows, and perhaps dances and games. The people meet because they have something to consult about, and not because some well-meaning person has said, "Go to, now—let us be social."

I am convinced that the school must furnish the nucleus of the rural social center of the future. It must do so by making its work a part of the farm work of the community. It must do so by an appeal to the economic sense of the people. It must do so by taking over and performing a great deal of work that can be done by the pupils to their great educational advantage, and to the financial benefit of the farmers. The schools are

equipped, or can equip themselves, to perform a great many such tasks. They may carry on cow-testing work for the upbuilding of dairy herds. They may work out balanced rations for the live stock and poultry of the neighborhood, in each case furnishing the farmer the instructions for mingling feeds, and telling what he should buy for the purpose of balancing the diet. For these things are a matter of investigation which any advanced class in a country school may do. They may keep records of the egg production of the various flocks, to the end that the best local strains may be known. They may record increases in weights of the different lots of animals being fed that the best rations and the best conditions and the best breeds may be recognized. They may analyze every lot of seed brought into the neighborhood, for foul seeds and for vitality. They may test the seed corn of the neighborhood, ear by ear, or if this seems impracticable, they may make and send out the cabinets for such testing at the homes. This work alone would add millions to the corn crop of any of our corn-growing states if it were universally carried out. They may test new vegetables and flowers. They may make garments for the homes. They may develop the art of cookery to the great satisfaction of the housewives. They may make war on flies and vermin. They may make the hookworm in our southern states a thing of the past. Some schools may do all of these things now, and any school may do some of them. And as soon as this work starts, the social center is well on the way to flourishing birth, whether it is intended or not.

There are other and higher tasks to which the rural schools may address themselves as they gather strength by contact with truth-tasks beyond the power of the ordinary farmer to perform. One of the greatest of these is the task of keeping the farm accounts. Many will be surprised at the statement that no satisfactory system of farm accounts of a statistical nature has as yet been worked out. So many agricultural economists are now at work on this matter, however, that we shall soon have, I doubt not, as good a cost system for the farm as we have for the factory. But it is certain that when the system is perfected it will be found too complex for the farmer to keep. A proper cost system for a farm is vastly more complex than the books of a bank. The farmer could not keep it if he knew how—it would take more time than he could give to it. But there seems to be no reason why the perfected rural school should not be able to keep the perfected accounts for the farm. It would constitute work of the highest educational value for the older pupils of the school. It would gradually accumulate a mass of facts as to the profits and losses in farming which would be of priceless value to economists now if accessible. It, in connection with the tasks I have mentioned, with soil analysis, and things generally which can be better done collectively than individually, will make the rural school the best business college in the world.

The rural school will thus become a farm laboratory and a domestic

science school. As a continuation school in which the grown people as well as the children are enrolled—in fact if not in form—it will command the constant attention, and attract the intensest interest of every patron. New buildings will be required, better grounds, and a stronger teaching force; but these will be eagerly furnished when, in addition to giving to the children and young people a broad and practical education, the school's work will have a great, a growing, and a measurable money value. Such a school will be merged in the general society of its community, and cease to be a thing apart. The life of the school and the life of the farm will be one.

Nobody who has seen the uplift which has come to a considerable number of our rural communities thru a correlation of rural school instruction with rural life can, I believe, condemn this picture as impossible. It is so far from being in the realm of the impossible as to be, in its beginnings, already in existence. Several of the states already require the teaching of agriculture and domestic economy in the rural schools. This teaching is in most schools very inadequate; but it is doing a great good even in its imperfections. The elements of agricultural science are not more difficult than are other studies which have been from time to time imposed upon our unprepared teaching force; and such is the grip of real truth related to actual life that this teaching possesses a gratifying vitality already. In several school systems rural life and rural sentiment have been profoundly affected by the timid beginnings of the new kind of rural school. I have in mind the conditions in Page County, Iowa, as best known to me personally. In Barnes County, North Dakota, the social center seems already in promising growth from the rural schools, and is assuming the very significant form of economic co-operation—that greatest need of rural life. In parts of the South the schools are taking hold on the eternal verities of Mother Earth in a wonderful way. And all over the nation the school activities in corn, tomatoes, flowers, live stock, sewing, cooking, sanitation, debating, entertainments, picnics, and all the needful factors of a full social life are manifold and increasing. The social center which I now here suggest will inevitably grow from these seeds, if the schools take up their true work—that of making themselves the social and economic laboratories of their communities.

The dream to me is a wonderful one. It means the ennobling of the rural teacher, and the magnifying of his functions and emoluments. It means the coming into its own of that long-contemned office, the county superintendency of schools. It means more money for schools, and money expended with actual financial profit to the community. It means that the school work shall be in large part economically productive work. It means a school system on which the people will spend their money with the same sense of good business judgment which they now feel in building barns. It means a longer school life for the farm boys and girls, for the

reason that their work will be necessary as well as educative. It means in every way a more contented, a more efficient, fuller rural life.

It will tend to arrest the drift of the rural population to the cities. An incident in proof of this, and I am done. Years ago in Wright County, Iowa, 157 boys and 174 girls in rural schools were asked their plans for life. All but seven of the boys, and all but eleven of the girls declared that they would have nothing to do with farming. During the next three years the teaching of agriculture and domestic science was introduced. Another vote was then taken in the same schools, with 174 boys and 178 girls voting. All but eleven of the boys and all but seventeen of the girls declared their intention of remaining on the farm.

This is a revolution in sentiment, and it means much. Once let these new schools complete their work of social regeneration and the drift will turn from the cities to the farm. We shall have opened to all eyes the attraction of rural life, as well as its material rewards; and out of the co-operative intercourse of the farmers of the nation will grow the new democracy which has been the dream of reformers and humanitarians.

TOPIC: THE PUBLIC SCHOOLS AND THE PUBLIC HEALTH

A. THE DUTY OF THE STATE IN THE MEDICAL INSPECTION OF SCHOOLS; RESULTS WHICH THE PUBLIC MAY RIGHTFULLY EXPECT

FLETCHER B. DRESSLAR, SPECIALIST IN SCHOOL HYGIENE,
BUREAU OF EDUCATION, WASHINGTON, D.C.

There are two main topics in the subject assigned me, viz., the right and duty of the state to institute medical inspection, and the results we have a right to expect from such inspection. I wish to discuss these two topics briefly and in the order named.

First: What right has the state to undertake medical inspection?

The state's vital interest is always the interest of the people; not the interest of the individual alone, but the interest of the individual living and working in harmony and co-operation with other individuals.

Questions of health and vitality are questions which concern the individual at every point. He can reach neither the measure of his own possible success, nor the acme of usefulness in society if hindered by disease or handicapped by a defective or enfeebled body. The health and vigor of each individual included in a social group directly or indirectly affect all.

The children must go to school; the laws compel the parents to send them. But how will you guard the child who comes from the clean home, and teach the child from the careless home, unless the school authorities know the conditions? Even to maintain the dignity of our public schools, to say nothing of the benefit to the children and society, it is incumbent

on us to make these schools both a worthy and a safe place for children to mingle with each other, to learn self-respect, love of justice, fair play, and those fundamental laws of health which are so often neglected.

It is the duty of the state to safeguard its own interests when localities within its borders neglect them. The health of a community is not of local interest merely, but directly and indirectly affects the general public weal. If a community in a state is inclined to pollute a stream of water which serves other communities, there is no longer any question of the right of the state to prevent this pollution. If a community thru ignorance or carelessness neglects the health of its children while in attendance on schools to which they are compelled to go, the state not only has the right, but is duty-bound to protect them as well as to help them. We have long since concluded that the state must, for the sake of its own progress and safety, educate all the children, and only seven states are now without some form of compulsory school attendance laws. We know that physical welfare and mental progress are inseparably related. Furthermore, we know that the public test of the value of any education lies in the added power of helpfulness thus created. The life's work of any individual—and I apply here the larger meaning to "life's work"—is measured by what he can do, and by what he is willing to do. I see no real meaning in all our educational striving save as it issues in better and larger service and influence. If an individual is handicapped thru physical defect or disease, he is thereby limited in his usefulness. If the state insists on proper mental development it has an equal right to insist on proper physical development. Indeed, an illiterate individual may be less serious as a menace to society than a diseased one who has had the ordinary schooling. If the state has the right to demand mental fitness, it has an equal right to demand physical fitness. If it has the right to prevent the contagion of ignorance, it has an equal right to prevent the contagion of disease and bodily neglect.

If medical inspection of school children is a useful means for conserving, protecting, and developing the health of our children, then it is unqualifiedly the right and duty of the state to foster and develop medical inspection. The chief asset of any state is physical stamina, guided by wholesome, moral ideals and broad-minded intellectual power.

Individual liberty is a fundamental conception in our government, but individual liberty is bound up with opportunity. That individual liberty which would limit itself is a spurious kind of liberty. Any individual who refuses to enlarge his field of freedom by limiting his personal opportunity is deliberately denying himself the highest type of freedom. If, therefore, it is clear that medical inspection of school children has aided in protecting children and society from disease and the baneful results of defective development, the right to medical inspection is clearly established. I am not afraid of that form of socialistic endeavor which helps all and harms none.

Granted now that the state has a right to look after matters pertaining to the health of school children, the next question to arise is this: Has medical inspection as now organized proved useful?

In order to determine with some degree of assurance whether such forms of medical inspection as we now have, have been useful in conserving the health and promoting the physical well-being of school children, it is necessary to set forth briefly some of the general results attained.

It has been demonstrated again and again, both in this country and in foreign lands, that careful inspection of school children has helped to prevent epidemics of contagious diseases. Many cities have gone little farther in medical inspection than to make this the chief aim of the work, and this service alone has been worth more than it costs. But since we have found out that even well children may be "carriers" of disease germs, it has become necessary to institute more careful examinations, even of well children, in order to remove such "carriers" from contact with other children more susceptible to disease. For example, Dr. Curtis Bland, in a recent report on an epidemic of diphtheria in the town of Greensburg, Ind., says:

> Out of a total of 872 cultures taken [from grade and high-school pupils, September 30–October 6, 1911] 288, or 33 per cent, came back positive. . . . . All parts of the town were found to be about equally infested with carriers.

Out of 400 "carriers" found in that town of 6,000 people, only 4 developed clinical symptoms of the disease. Plainly, under such conditions, the only way to break up an epidemic is to search out the "carriers" among the well people, isolate them, and treat them. He rightly concludes that to fight an epidemic of diphtheria the carriers must be discovered and isolated. To this we might add, if an epidemic of diphtheria is to be prevented, carriers must be found before they endanger others. This, adequate medical inspection would accomplish.

Medical inspection has served the purpose of exposing to us in a glaring way the fact that school conditions are responsible for the progressive development of many defects. A great mass of evidence has been collected showing conclusively that school conditions and school demands tend to develop myopia, scoliosis, anæmia, retardation in physical growth, and all the ills in its train.

I am well aware that statistics can be found that will prove or disprove almost everything, and that great caution is needed in arriving at sweeping conclusions. But when careful statistics and common-sense tally, as they do in these particulars, the conclusions expressed are warranted. Overcrowding, bad ventilation, unhygienic school desks, poor lighting, a superabundance of writing and book work, together with lack of freedom and opportunity for out-of-door games or wholesome physical exercise, have furnished unnatural conditions for normal development, and we have no right to expect better results until these conditions are ameliorated.

Medical inspection has made it possible to secure better attendance and fewer interruptions by reason of the consequent decrease in the amount of illness among the children. The work of the school nurse in conjunction with the health officer has done much to correct defects, interest the home in matters of sanitation, and greatly add to the school life of many children. Schools have been enabled to continue their work even in the presence of an epidemic of contagion, when thru careful inspection, carriers have been detected and isolated. Often, from this point alone, medical inspection has saved more than it cost.

Best of all, where medical inspection has been in the hands of wise and carefully trained men, and where it has been supervised and handled from an educational point of view, it has been an educational agent of great moment. It has served not only to correct faulty school conditions and practices, but likewise to correct unhygienic and unwholesome home conditions. Especially is this true where, thru the agency of school nurses, the most effective follow-up work has been done. It has helped to clean up the home, to stimulate parents to give more attention to the food, the clothing, sleeping-rooms, and general home sanitation. This phase of the work is just beginning, but its future development will be a powerful agency in home sanitation.

There has been a marvelous increase in the last five years in the number of cities undertaking medical inspection. In many places enthusiasm has outrun good judgment, or at least the work has been undertaken with little understanding of its true purposes, and doctors with no sort of adequate training have been selected to do the work. Perhaps no title has had so much power over the people as the title of doctor.

It will do comparatively little good to examine hastily thousands of children and tabulate the defects in impressive columns unless intelligent steps are taken to prevent such defects, and to correct those already found. And here lies the chief weakness of the work in this country. The findings of untrained and overzealous inspectors are criticized by family physicians who are jealous of what they consider their rights. Opinions clash, and professional jealousy always runs high, especially where scant knowledge is involved, or where financial interests are at stake. Because of these difficulties, Dr. Cabot, of Massachusetts, has claimed that better results in small towns are obtained by the use of trained nurses alone than have been obtained in large cities where doctors of medicine have been selected to examine the children.

But in many cities there is developing a broad-minded and intelligent policy regarding the purposes of medical inspection. By the courtesy of Dr. Gallivan, the Chief of the Division of Child Hygiene of the Boston Board of Health, I am able to present the following from a report of the work for the five months ending February 1 of the present year:

Medical inspection of schools begins at the kindergarten class and ends with the high schools. Of equal importance are the three objects which medical inspection has in view:

1. The detection of communicable diseases and the exclusion from school of every pupil so afflicted.

2. The protection of every pupil in the schools from contagion unrecognized by parent or teacher.

3. The detection of such defects which, if untreated, would result in permanent injury to the pupil.

For the work of school inspection in Boston, 82 physicians are employed under the direction of the Board of Health. These physicians visit both the public and parochial schools daily. During the five months mentioned, in addition to general inspection, physical examinations were made of 82,224 of the 123,091 children then in school. Of those examined, they found 28,721 free from defect, while 53,503 were found defective, many in more than one way.

The school committee employs nurses to follow out as far as possible the directions of the school inspections. These nurses visit the homes, consult with parents concerning the treatment the children should have, and, if need be, accompany them to physicians, hospitals, or clinics.

But the work of the Division of Hygiene goes much farther: "It is concerned with the physical welfare of every child in Boston from the time of conception up to the age of sixteen years." The work of the division is classified into three subdivisions as follows:

1. Prenatal and postnatal work.
2. Medical inspection of schools.
3. Physical examination of licensed minors.

I have no time to go into further details but it is evident that here we have a clearly conceived duty regarding the health of the community, far wider than mere medical inspection. Many other cities in the country have, in no uncertain terms, recognized the same duty to the children as well as to the general welfare, and there is no doubt of the fact that we are in the beginning of a comprehensive movement for conserving the physical stamina and preserving the health of our people. But we have scarcely begun. As usual, with all beginnings for better things, we are now chiefly engaged in locking barn doors after the horses have been stolen.

We now come to the second main topic: What results may the public rightfully expect of medical inspection of school children?

The public has a right to expect from medical inspection largely what it intelligently demands of it, and according to the sort of support it has given to it. If the public does not know what medical inspection involves in the way of skill, organization, and support, it is likely to get corresponding haphazard results. Some cities are getting excellent results, some are accomplishing comparatively little; simply because some insist on real

inspection and examinations by qualified inspectors, while others leave things to chance, and the right chance rarely comes.

Before the state can expect the best results, it must insist that those who go into the schools to look after the health and normal development of children must be appointed to do this by reason of special fitness. Generally speaking, this has not been the prevailing practice in America, and of course medical inspection has not done its full service under such conditions. Professional jealousy and personal politics have played conspicuous parts in appointments.

We are in need of more health inspectors, those knowing more about education, more about the normal growth and development of children, and especially more about physical education and general hygiene. Our best medical schools ought to offer courses preparatory to this work. We need more doctors of public health than mere doctors of medicine. Meanwhile, before we can get them, the public must be educated to ask for them and to pay for their services when secured; and the better fitted the health inspector the better to make his payment, with absolutely no place in the scheme of things for the political man or the man not consecrated to the work.

The term medical inspection is an unfortunate one for designating what ought to be the chief work of the health officer for schools. School children would need little medicine and less medical advice if we had more sanitarians and doctors of public health to teach them and their parents how to be clean and how to care for their health in every way.

Our system of paying doctors to do something for us when we get sick ought to be largely discarded for the Chinese system of paying them to keep us from getting sick. Our medical inspectors are now on the hunt for defects, and they sometimes get so enamored with beautiful cases of disease that they cannot passionately love a case of perfect health and perfect development. The normal with many of them is the abnormal. In proof of this statement, I wish to call attention to the great variations in reports from medical inspectors in different parts of the country, in the same cities and regarding the same children.

In New York City, for example, it was found that two inspectors examining comparable children in the same school reported results differing by 100 per cent. It was also found that some inspectors found few instances of many defects, while others found many instances of practically every defect listed.

It has become clearly evident, to those who are critically examining into the results of medical inspection, that men and women who undertake to supervise the health department of schools must have special training for this work. Neither the narrow specialist nor the general practitioner is necessarily competent to do this work in a satisfactory manner.

The most significant, ultimate good of medical inspection, I believe,

will arise from the increased knowledge by the people as a whole concerning the personal care of health. Great numbers of our people are yet in gross ignorance and superstition concerning matters of health and disease. Obituaries are printed in the newspapers of all parts of our country, reading much as follows: It has pleased an all-wise and Divine Providence to take from our midst a youth of great promise, etc. By reading a little farther you will see that that Divine Providence was a case of typhoid fever, a disease induced by filth. Such obituaries are not only criminally false, they are ungodly, impious, and wicked. They should state that by reason of carelessness, ignorance, and filth, a promising life has been sacrificed, to the great displeasure of an all-wise Deity.

There are thousands of people in this country who will not see that vaccination does and will prevent smallpox. They are willing to set all sorts of personal theories and motives against the facts. They do not really know the difference between proof and belief. There are great numbers of intelligent people who have no useful conception of the relation of bacteria to diseases. They are ready indeed to assert vigorously that all this talk about germs is just a fad. It does no good simply to decry these conditions. The people must be educated more systematically, persistently, and purposefully in sanitary matters.

Our chief duty lies in removing the causes which contribute to physical unsoundness and disease. As long as we herd our children in schools where they must breathe impure air, bend over insanitary school desks, work at books when they need physical exercise, just so long shall we be paying for our own errors. Medical inspection will not and cannot save the children of our great cities from degeneration and disease, unless thru this agency we are led to see more clearly the results of unhygienic living.

If medical inspection can make clear our defects and at the same time teach the people the absolute requisites of wholesome living, then a new education will actually begin.

I maintain, therefore, that the chief objects of so-called medical inspection must include the following points:

1. It ought to serve as an efficient means of preventing the spread of contagious diseases, particularly those to which school children are peculiarly susceptible. This will necessitate a careful examination of all children, especially at the beginning of the school terms, in order to exclude both children who are suffering from contagious or parasitic diseases, and those "carriers" who are a menace to others, even tho they themselves show no decided effects of the diseases they are capable of disseminating.

2. Medical inspection ought to emphasize in a decided way the especial significance of hygienic conditions in schools. It seems more than foolish to shut up our well children in unventilated and improperly lighted schoolrooms, furnish them no playgrounds, compel them to live a life not in accord with the laws of physical development, and then when they become

anæmic, nearsighted, and defective, make a great stir about special classes for defectives, and spend in building special schools money better spent in keeping children well. We must learn that it is far more important to furnish conditions which promote the health and development of well children than it is to make special efforts to care for those who are sick or defective, especially where these defects have been largely induced thru our neglect.

3. Health officers must know more about education; more about the hygiene of teaching; more about the normal demands of child-life; must possess more ability to work with teachers and the people for the general welfare of the community. A large majority of physicians, those who would not hesitate to undertake the work of supervising the health interests centered in our public schools, are wholly unfit for the place because they know next to nothing of the ideals and methods of modern education, and they are ignorant of their ignorance. The best results cannot obtain under such conditions.

4. We need health officers whose chief delight is in finding and developing beautiful cases of physical perfection rather than in finding some obscure and rare disease.

We need doctors of health who will be more delighted in exhibiting a large list of healthy, well-developed children than a long list of those who are physically defective and diseased. To be sure, they must be able to see defects and diagnose correctly, but their chief emphasis should be in preventive measures. School men are pretty thoroly tired of the mere finding of defects; they need more help in preventing them.

We need health officers who embody a combination of the Athenian worship of physical perfection, the enthusiasm and skill of the modern bacteriologist, and the spirit of the teacher whose face is turned toward better things. We need health officers whose philosophy is based on the gospel of physical vigor, on the sanctity of personal purity, and on the godliness of clean living.

B. THE TEACHING OF PERSONAL HYGIENE IN THE SCHOOLS

DAVID STARR JORDAN, PRESIDENT OF LELAND STANFORD JUNIOR UNIVERSITY, STANFORD UNIVERSITY, CAL.

The teaching of hygiene in the schools demands imperatively two things: first, that the teacher should know thoroly what he is talking about; and second, that he should know how to join his ideas effectively to those the children already have. As hygiene is applied physiology, and as physiology rests on biology and chemistry, instruction in hygiene cannot be effective if the teacher does not possess the knowledge on which it rests.

In the teaching of the hygiene of sex, the most difficult of all biological

problems, and the most beset with embarrassments to the teacher, the end in view is to make certain elementary ideas the common property of all intelligent people, to make them, like the knowledge of gravitation or of the multiplication table, a matter of course, to be used unconsciously as a basis for conduct.

So long as information of this kind is forbidden knowledge, or knowledge to be obtained on the sly, so long will the danger of sex-perversion exist. Other dangers arise when this kind of instruction has undue attention called to it. The teacher cannot speak effectively on these matters without full and accurate knowledge. Too much study on these topics is dangerous to the sanity of the teacher. They should constitute not the whole but a proportional part of his biological studies. Besides the teacher's difficulties with himself, there is with the children a constant risk of rousing curiosities that should lie dormant. More young men are led into evil thru sheer curiosity than thru any form of inborn weakness or perversity.

But knowledge of this sort sooner or later will come to the child and the purer the channel, the better for the child's welfare.

Instruction in sex hygiene must include about four elements. These should be introduced, each in its turn according to the best judgment of the teacher, the last of them not much below the middle of the high-school course. These four are: (1) the meaning of parenthood in plants and animals; (2) the evils of sex perversion; (3) the existence of the "red plague" of parasitic organisms; and (4) the need of social sanitation. All these should be taught as simple facts, without hysterical emphasis. The processes of generation, the union of the pollen or male germ cells bearing hereditary material of the one plant, with the static ovule or female germ cell of the same or another plant, can be explained and illustrated. The sexes share alike in the impulse of heredity, the male germ cells are movable, the female sessile, because where they are the new plant must grow up. The function of cell-union is to bring variety. As each individual "takes after" or follows the qualities of both parents, it can never be the slavish copy of either. Something can be taught of the cell-nucleus, its chromosomes and their relation as probable bearers from generation to generation of unit characters. It can be shown that each individual represents a "mosaic" of characters of parents and of earlier ancestors. It can be shown also that certain traits may be recessive or hidden in one generation and dominant or evident in the next.

The general facts of heredity are the same in plants and animals, in man as in the lower forms. The details of the reproductive process vary with the mode of life of the different types of organism.

The question of self-restraint and of social morals must find its place somewhere. The "double standard of morality" can exist only among people who have no real standards of conduct. Laxity of life destroys ideals, destroys courage, destroys the possibility of real love and real happiness.

Immorality has its own punishments and these lie mostly in the loss of self-respect and in the loss of those rewards which make life worth living.

But over and beyond these, physical contact of any kind with immoral people has its own dangers. The possibility of infection with the parasitic organisms which cause the "red plague" exists always in such association. The "red plague" is not the penalty of vice, nor is it a result of excess. It is an ever-present danger into which every person leading a loose life even for a single hour is almost certain to fall and which causes misery and death to thousands of innocent people. These diseases differ from other infectious diseases mainly in this, that the organisms which cause them are slow-maturing, and that a person may be a dangerous source of infection while apparently entirely well and able to attend to the ordinary affairs of life. A victim of yellow fever, smallpox, diphtheria, or bubonic plague must take to his bed. These diseases run their course rapidly. Sometimes a victim of typhoid fever may not appear to be ill. Such people become the dangerous "typhoid-carriers," who bring death to others thru organisms which give little inconvenience to themselves.

The disease caused by the plant "gonococcus" has been known for ages. It does not always cause disability but it is very hard to exterminate. No one once infected is ever sure that he has been cured. This disease is a potent cause of surgical operations in women. Its infection in the eyes of children at birth is the most frequent cause of blindness. The evils it causes are innumerable, the more so because those infected are likely to treat it as a joke, and in course of time every prostitute, man or woman, becomes infected. It is therefore the certain result of immoral life, tho in no sense a result or penalty of immorality. To visit a house of ill fame is to plunge into infection.

More subtle and more immediately destructive is the animal organism known as "Spirochæte." This minute creature devours the walls of the capillaries. When it attacks the brain, it produces softening of the tissues which shows itself in hopeless insanity. In Ibsen's play *Ghosts*, Oswald describes himself as *vermoulu*, worm eaten thruout thru the presence of organisms derived from his father. The disease is not hereditary. No disease is hereditary, only the tendency to disorder, but in this case the living Spirochæte may pass from father to mother and in the nourishing blood from mother to child. The movement of armies has spread the disease over the whole world. In the cities of the tropics, it is especially widely diffused and it may be transmitted by means of towels, drinking-cups, and in many other ways. The idle rich and the idle poor are especially subject to it.

As a sanitary measure, it is one of the first duties of civilization to stamp it out. This can be done only by the suppression of its means of continuance. The social evil, the red-light districts in our cities, serve as the breeding-nests of these organisms. The white-slave traffic, an outgrowth

of supposed necessities of the standing armies of Europe, is essential to keeping up these districts, and it must be suppressed. The cost of a month's expense of the United States government for smokeless powder ($9,500 per day) would suffice for this extermination. To this end the American Vigilance Association is pledged.

Segregation of evil only serves to legalize it, never to diminish it. And these evils are no more necessary to society than are arson, burglary, and murder, which society consistently fights, altho it has never succeeded in suppressing them. The great count against the saloon is that everywhere in all countries, with but few exceptions, it is an open door to the brothel. Sober men, and for that matter drunken men, rarely visit the houses of evil. Exhilarated curiosity brings the ruin of thousands and the statistics of one of our military posts show that the road to ruin is made easy by beer.

To teach these matters quietly, judiciously, accurately, and intelligently, each in its turn, and without exaggeration and without hysteria, is the work of the wise and discriminating teacher. It is not best to force them on the schools before the teachers which can do this are found.

C. SANITARY EDUCATION IN RURAL COMMUNITIES

CHARLES E. NORTH, M.D., NEW YORK, N.Y.

The work of sanitation.—The work of sanitation is to prevent the transference of infection from one individual to another individual. There is much mystery in the popular mind as to the meaning of the term "infection"; the words "bacteria" and "germs" have come into popular use, but convey only vague ideas to many of us. It is common knowledge that the living things about us can be divided into the plant kingdom and the animal kingdom. Scientists have decided that bacteria belong to the plant kingdom.

As one walks out into the fields and views the trees, the flowers, and the grass, these things do not arouse any alarm. The vegetables in the garden and the flowers growing in the ground are looked upon as entirely harmless, and many of them as most useful to mankind. It is true, however, that here and there a very few may be poisonous. The poison ivy, some few mushrooms, one species of sumac, and possibly a very few other plants are known to be poisonous, but these poisonous plants are very few and very rare. It is remarkable also what a great difference there is in the size of plants. Some of the giant trees are the largest. From these we can descend by degrees to the mosses and to the molds, which we now know are tiny plants. The microscope reveals a new plant world. The mosses and molds immediately become giants, and thru the microscope we see numerous smaller plants. The smallest of all are the bacteria. Some of these are so tiny that thru the most powerful microscope they appear only as a minute

speck or dot. There are hundreds and perhaps thousands of varieties of them. Among these, just as among the large plants of which we have spoken, there are very few which are poisonous. Thus tuberculosis and typhoid and diphtheria are each caused by a small poisonous plant. The other diseases called infectious diseases are caused by other varieties, but the great majority of these bacteria are entirely harmless and some of them, in fact, seem quite useful and necessary to the welfare of human beings.

The giant trees are historically among the youngest of plants. The most ancient of all, the scientists tell us, are the bacteria. They are the ancestors of all other forms of vegetable life, and the numerous plants and trees which we now see are the direct descendants of ancient bacteria. Before animals were created, there was no tuberculosis or typhoid or diphtheria, but after the animals and men appeared, some of these tiny plants accidentally took up their residence in the noses and throats and intestines of men. It was a startling event when these tiny plants learned how to live and grow inside of animals. When they did so, infectious diseases first began.

At the present time there are many men, women, and little children in whom these plants have taken up their residence. In fact, having once learned how to grow in animals, many of them have entirely lost their power of growing anywhere else, and cannot live at all without the warmth and nourishment which they receive in living persons.

Tuberculosis is caused by the tubercle bacillus, a tiny plant which centuries ago took up its residence in human beings and animals, and has become acclimated so that now it can be grown only with the greatest difficulty outside of the body, and only when the body conditions have been imitated in the laboratory. Out of doors this plant will not grow at all, but soon dies. The same thing is true of the typhoid bacillus, of the diphtheria bacillus, and of the other kinds of bacteria causing our infectious diseases. They will live when in men and animals, and under special laboratory conditions, but soon die when exposed to out-of-door conditions.

Certain human beings are inhabited by these plants. Some animals are inhabited by them. Their existence is continued from generation to generation only because certain men and animals in whom they live pass them on to other men and other animals by a transference which is direct or indirect from those who are inhabited to those who are not. Thus we have with us people who are carriers of the tubercle bacillus, and people who are carriers of the typhoid bacillus, and people who are carriers of diphtheria bacillus, both children and adults, and these persons thru ignorance and carelessness transfer the bacteria which they are carrying to others who have been free from them, and in this way the infectious diseases are transferred from year to year and from generation to generation.

The practicing sanitarian has numerous illustrations of this fact. In

one of my own recent investigations I was called to the Adirondack Mountains to inquire into the cause of an outbreak of typhoid fever in a summer colony patronized by some of the wealthiest people of New York City. During two months, twenty-seven cases of typhoid fever had broken out in the camp. The cause was mysterious. All ordinary sources of the disease were investigated without result. It was only after six weeks of study that the discovery was made that one of the guides employed at the camp was the carrier of typhoid bacteria. This man was over seventy years of age and appeared to be in perfect health. He had no recollection of ever having typhoid fever, yet his system was so badly infected with these plants that he was discharging them in enormous numbers every day. He was the undoubted cause of not only twenty-seven cases and three deaths which had occurred in the last outbreak, but of eight cases which had occurred at the same camp in previous years. It is assumed that there are now 18,000 persons in the United States, apparently in perfect condition physically, who carry typhoid bacteria in their bodies and who are the cause of the annual outbreaks of typhoid fever from which this country suffers.

It is an old superstition that some houses are haunted with tuberculosis. It has been said that in country districts members of some families who have lived in the same house for generations have tuberculosis while people in other families are free from the disease. We now know that it is not the house itself which must be feared, but the people who live in it. While it is true that the bacteria of tuberculosis may remain alive for a time after they are discharged onto the ground or onto the floor of a house, yet their life is comparatively short, and they are soon killed by sunlight, and by external conditions. Bacteria are to be feared most in a fresh condition, and when the transfer takes place from person to person, it is, as a rule, by direct contact or by contact with something which has very recently received infection. In the case of tuberculosis, the use of spoons, drinking-cups, and handkerchiefs is a common means of transfer, or the direct breathing of air which has been recently polluted by the coughing or sneezing of infected persons. In a similar direct manner the transference of other infectious diseases takes place.

The work of sanitation consists in preventing this transference. Sanitation aims to protect the child and the adult who are free from infectious diseases against the transfer of bacteria from the children and the adults who are carriers of these bacteria. Sanitary science has made a study of all of the channels, both direct and indirect, thru which these transfers take place, and the best means for their prevention.

Conditions in rural communities.—Sixty-six per cent of the population of the United States live in rural communities, and 34 per cent live in large cities. There are about 1,500,000 people who die each year in the United States, and 3,000,000 who are sick and who do not die. Each year in the

United States 630,000 people die from infectious diseases. This literally means that this number of persons are poisoned to death by the growth of these small plants called bacteria. The deaths would not have occurred if these bacteria had not taken up their residence in these people. The death-rate in rural districts is slightly less than the death-rate in cities. Thus in country districts out of each 100,000 persons there are 1,400 who die each year, while in cities out of an equal number there are 1,650. Out of a rural population of about 60,000,000, there are annually killed about 400,000 persons from infectious diseases.

Theoretically life in the country is more natural and healthful than city life—air is better; food is fresher; there is less noise and smaller tax on the nervous system, and other conditions which warrant the statement that country life is healthier. Man is, in fact, an outdoor animal, and city life in a broad sense is artificial life, but the dwellers in rural districts do not obtain the full benefits of their natural surroundings, thru their own ignorance and carelessness. Studies of the water supplies of farms both in Canada and in the United States show that 60 per cent of the wells are polluted with house and barnyard drainage. The milk supplies while fresh too often have their source in tuberculous cows and are produced under unsanitary conditions. Disposal of human and animal waste products is commonly primitive, and these are, as a rule, exposed to flies in a manner that makes the transference of bacteria to the house and to the food easy. Sleeping with closed windows is common, so that house air in the country is often worse than house air in the city. Cellars are damp and improperly drained. The common drinking-cup or dipper is a regular institution, as is also the roller towel. Hot water is scarce, and consequently the dish-washing process suffers. As a consequence of these things even in the country there is an abundance of infectious diseases.

In rural districts in each 100,000 inhabitants, bacteria of tuberculosis kill each year 136; bacteria of intestinal inflammations, including infant diarrhea, and all other forms of intestinal diseases, excepting typhoid, kill 97; bacteria causing bronchitis and influenza kill 90; bacteria of pneumonia 83; typhoid bacillus kills 24; and diphtheria bacillus kills 17; bacteria of whooping-cough kill 12; bacteria of scarlet fever (undiscovered) kill 8; bacteria of measles (undiscovered) kill 8; and there are some other infectious diseases of lesser importance.

The conditions in rural communities differ from those in cities most markedly in one respect. The concentration of dwellings and of people in cities has compelled attention to public health matters, so that money and organizations are employed and rules and regulations enforced which have as their object the protection of the inhabitants against transference of infection thru water, milk, waste products, etc. On the other hand, in country districts the population is so scattered that there is less community of interest. In agricultural districts each farm is almost an independent

social unit, and has its own water supply, milk supply, and sewerage system. Its sanitary conditions are whatever the proprietor chooses to make them. Public health supervision over sanitary matters is, at best, but slight, and in the greater part of the country is entirely lacking. Rural districts do not lend themselves to the influence of public health authorities as urban conditions do, and consequently there has been a much greater reduction in the death-rate in our cities during the past few decades than in our rural communities. It seems obvious that since the most prominent characteristic of rural life is the independent position of the farmer, more is to be hoped for by direct appeal to his own intelligence than by official supervision. In other words, the key to the improvement of sanitary conditions in the country lies in public education.

The country school-teacher as a public health educator.—The intellectual authority as well as the social leader in rural districts is the country school-teacher. As a class there is no element of rural society in a position to wield greater influence in matters which pertain to social welfare. The movement toward better conditions of life has been carried to such a point that it has penetrated the educational systems in our cities, and is rapidly gaining an important place in public-school work. Beginning with personal hygiene and medical inspection, public health work in city schools will soon reach a point where the art of clean living will be taught; a child will learn the value of self-care in the matter of contracting infectious diseases. In rural schools, however, the movement has not gathered such headway. The teaching of physiology in the village school may satisfy the curiosity of children as to their internal organs, but does not in any way protect them against bovine tuberculosis from contaminated milk, or against typhoid from impure water. The rising generation has a right to be instructed in the first principles of sanitary science. This knowledge is even more important than the knowledge of physiology.

It might seem at first thought that the subject of public health is too difficult to be taught in the district school, but there is no subject that lends itself so readily to popular interest and to the interest of children. Such a simple matter as the washing of the hands may be made a matter of the greatest interest when studied from the standpoint of bacteria. A demonstration of bacteria by the use of glass plates and simple culture media is extremely simple and something that arouses the greatest interest in youthful minds. The microscope is always an instrument which arouses curiosity and which can be used to illustrate many sanitary lessons. Personal cleanliness, purity of food and of drinks, and a knowledge of the nature of disease and the methods of transference are all things which can be expressed in the simplest terms and made clear to the understanding of children. The subject of water, its pollution and its protection, can easily be made plain. Milk, its value as a food, highly appreciated by bacteria, and therefore the necessity of protecting it against them, is not too difficult a subject for

the child to understand. The cold in the head and sore throat caused by the growth of bacteria on the surface of the mucous membranes, and the danger to others of these bacteria when discharged in coughing and sneezing can be explained in simple terms.

But such work as this demands preliminary training. If the country school-teacher is to be armed with the knowledge of sanitary science, she must find this in the normal school and teachers' college. Our normal schools and teachers' colleges should have regular courses in public health work. We are dealing here, not with a merely academic subject, but something vital in importance, something which means the lengthening of life and the reduction of the death-rate to the people among whom the teacher is to practice her profession.

As a movement, the interest in public health matters has gathered tremendous force in the last ten years. In the majority of our cities it is now thought necessary to appoint a man to the position of public health officer who knows something of medicine and of sanitation. Three of our great universities have come forward and offer degrees for those specializing in public health work. Philanthropists, social workers, and engineers have already undertaken extensive enterprises in this field of work. Among educators, however, but little has been done.

The National Education Association in public health work.—The time seems ripe for public health work to be taken up as an educational matter. I hope I am not exceeding my privileges in suggesting that it is a matter worthy of a place in the progressive program of work of the National Education Association. A standing committee for the promotion of public health education as part of the organization of the National Education Association would give great impetus to the institution of courses in public health in our school systems. Such a committee could encourage the establishment of training-courses for teachers in the normal schools and teachers' colleges. It could encourage the publication of textbooks for the various grades of work, and the institution of laboratories in our public schools for the demonstration of the principles of sanitary science. It could arrange for systematic popular lecture-courses on matters of public health.

Results.—The possibilities of such work are not vague, but have actually been set down in figures by students of vital statistics. In the report of the National Conservation Commission printed by the Committee of One Hundred, it is stated that the average length of life of the inhabitants of the United States is now 45 years. (One hundred years ago the average length of life in Europe was less than one-half of this.) It is estimated that if sanitation were enforced the span of life would be prolonged by about 15 years, so that the average length of life would be 60 years. Seventy-five per cent of deaths from tuberculosis, 45 per cent of those from lobar pneumonia, 50 per cent of those from broncho-pneumonia, 85 per cent of those from typhoid fever, 60 per cent of deaths from infantile diarrhea, and

70 per cent of deaths from meningitis would be prevented simply by insistence by the public on pure milk and pure water and pure air. In rural communities in the United States 400,000 people each year die, and in addition to these about 2,000,000 persons annually are seriously ill, from infectious diseases. Even if only one-half of these deaths and cases of sickness can be prevented by education, it means that an immense field of useful work lies at the hand of the country school-teacher who will become a public health educator and will instruct the children and the mothers and fathers how to prevent the transference of poisonous bacteria from those who carry them to those who do not.

D. THE MEDICAL INSPECTION OF SCHOOLS AND MEDICAL FREEDOM

CHARLES A. L. REED, M.D., PROFESSOR IN THE UNIVERSITY OF CINCINNATI, CINCINNATI, OHIO

A proper discussion and a proper understanding of the theme that has been assigned to me must begin with a proper understanding of its constituent terms. In other words what are we to understand by "the school," by "medical inspection," and by "medical freedom"?

The school is an instrumentality that has been evolved by society for the better development of human efficiency. It began with a group of children collected together for the purpose of acquiring the elements of learning; it has become an aggregation of children gathered together, not alone to acquire smatterings of concrete knowledge, not for the improvement of their own minds alone, but for the physical, mental, and moral betterment of the race. I may add that another purpose has crept into the school, in some instances has come to dominate it, and that purpose is the development of individual aptitudes to meet the special practical purposes of life. If, now, we contemplate the school from the viewpoint of any or all of these attributes, we shall find that our definition is correct and that no narrower conception is justified by the school as it exists in the United States today.

If, now, we accept the schools as one of the agencies that society in the exercise of its own rights has established for the development of its own efficiency, we must concede that society has not only the co-ordinate right to protect that agency against deleterious influences, but the equally co-ordinate right still farther to promote its effectiveness. We may go even a step farther, and state that society, as the creator and maintainer of the school, has the unquestioned right to protect itself against any deleterious influence, physical, mental, or moral, that may originate in, or be disseminated by or thru, the school. The significance of these self-evident principles is to be found in the fact that the school, as it exists in the United

States, today represents a grand aggregate of something like twenty-one millions of youths of both sexes and various ages. It is segregated into groups of from a dozen to a dozen hundred or more, scattered absolutely all over our land. These constituent groups assemble on a probable average of two hundred different days every year. The individuals that make up these groups come from every conceivable avenue of life. There is none of the various influences that can modify human existence to which various members of this group are not subject. Within limitations, each may influence all and all may influence each, and individuals may in turn influence the homes from which they come. In no particular is this more true than with respect to contagious and infectious diseases. In the years gone by, this fact was recognized in a more or less empirical way; since the establishment of the germ causation of disease, it has passed into the realm of axiomatic truth. Tuberculosis, smallpox, diphtheria, scarlet fever, measles, and whooping-cough are among the more familiar examples of diseases susceptible of communication thru the school. More than 500,000 die from epidemic diseases, including tuberculosis, every year in the United States. That means the death of one person every minute, or an annual aggregate equal twice over to both the army and the navy of the United States. The economic loss in the per capita valuation of human life amounts to more than one billion dollars every year—more than enough to defray all the expenses of all the departments of the United States government.

The economic loss from wasted time and dissipated potentiality defies computation. The influence of defective hygiene, personal and architectural, not only in propagating these diseases, but in developing new or aggravating old physical defects, vast and disastrous as it is known to be, cannot be determined without data which have never yet been reduced to record. The no less disastrous results of tasks, mental and physical, imposed upon pupils without reference to their individual physiological limitations, while not susceptible of expression in definite terms, are known to be appalling. The possible further adaptation of school methods to the even greater physical and mental development of the pupil is recognized by every progressive educator and only awaits the co-operation of the teacher and the physician to become an accomplished fact.

It will thus be seen that the school made up of about a quarter of our great population has great inherent possibilities for evil as well as for good, and that the duty of society is to safeguard and promote it as one of the chief means for the development of human efficiency.

It will be seen from this survey of the school that the problems involved in protecting it from deleterious influences and in still further developing its beneficent possibilities are primarily and fundamentally those that relate to the health of the pupil. The proper conservation of this greatest national resource, the health of the rising generation, involves an intimate

technical and professional knowledge of anatomy, physiology, hygiene, the causes and prevention of disease, and the art to determine and define the physiological limitation of the individual pupil.

It is the practical application of this knowledge to the protection of the pupil and the school, each against the other, that comprises what has come to be designated as the medical inspection of schools. It is not a new idea. Its germination goes back to 1833, when France, by decree, inaugurated the hygienic control of schools. In the seventies, the full modern idea was exemplified in Belgium. Leading German cities followed. Then came Great Britain. Hungary, Austria, Norway, Sweden, Switzerland, Roumania, Russia, Egypt, Chile, the Argentine Republic, and Japan have medical inspection of schools. In the majority of these countries such inspection is national in scope; in others it is restricted to certain states and cities.

In the United States the practice began in Boston in 1894. It has since spread to all the larger cities. In several states the provision is state wide, and applies to rural as well as urban schools. It should be shouted from the housetops that, of the two classes of schools, those in rural districts need the protection derivable from medical inspection more than do those of the cities.

As practiced in the United States today, medical inspection of schools is variously under the direction of either the boards of health or the boards of education, or both acting together. The executive body appoints the requisite number of medical men to act as inspectors. In Cincinnati these physicians are appointed by the board of health, from a list of eligibles furnished after examinations conducted under the direction of the municipal Civil Service Commission. These examinations are open to any physician of any "school," or of no "school" at all. The duties of the physicians thus appointed, so far as the schools are concerned, are to study the hygiene of buildings, more particularly as to heat, light, ventilation, furniture, water supply, drainage, and facilities for recreation; to examine pupils referred by teachers as suspected of having such contagious and infectious diseases as tuberculosis, smallpox, scarlet fever, measles, whooping-cough, and trachoma, or who are supposed to have vermin, or to be afflicted with bodily defects or deformities; displacements either of bones or viscera, or growths such as adenoids; or defective vision, or bad hearing. In the case of contagious and infectious diseases, the child is sent home for the protection of the other children in the school; in other instances, it may be sent home for its own protection. In either event, an explanatory note is sent with the child, accompanied by the suggestion that the case be at once brought to the attention of the family physician. The family, of course, have perfect freedom to choose any physician of any "school," or of no "school" at all. The inspectors never treat cases, as they are not permitted to engage in private practice. In this way parents are given

absolute freedom to choose their own physician or no physician at all as they may deem fit. The medical inspector simply sees to it that the child is in safe condition before it is permitted to re-enter the school. Children are likewise examined with reference to their adaptability to certain tasks, and to various forms of physical training. In this way the pupil is individualized, and his aptitudes are determined. And in this way is formed a policy that, in the language of the English Board of Education, "is founded on a recognition of the close connection that exists between the physical and mental condition of the children and the whole process of education. It recognizes the importance of satisfactory environment, physical and educational, and by bringing into prominence the effect of environment upon the personality of the individual child, seeks to secure ultimately for every child, normal or defective, conditions of life compatible with that full and effective development of its organic functions, its special senses, and its mental powers, which constitute a true education."

It is evident from a brief survey of the functions here enumerated, that they must be exercised by persons of adequate technical knowledge represented only by the medical profession. It is furthermore evident that the exercise of these functions is of greatest importance in order of occurrence, first, to the individual pupil; next, to the other pupils of the school; next, to the family of the individual pupil; and finally to the community at large, and to the race.

In a selfish sense, the medical inspection of schools is of the least possible value to the medical profession. As a matter of fact, that profession, thru its own activity in the prevention of disease during the last twenty-five years, has deprived itself of nearly 40 per cent of its previous employment. I am proud to proclaim that its efforts to prevent disease were never so effective or so enthusiastic as they are today. And I have no hesitancy in stating that no line of its altruistic efforts offers greater substantial reward to society and less substantial reward to the medical profession itself, than does the medical inspection of schools. So evident is this truth, and so beneficent is that truth in its effect upon the people, individually and collectively, that intelligence and humanity are shocked to realize that the least opposition can be found to the universal inauguration of the régime. Of course in this country, as in all other countries, is to be found the occasional crank who is always on the other side of every question. Then, too, there is the occasional individual whose selfish interests are menaced by the public welfare. With these are always to be found certain blind followers of any person who is at once loud and insistent. As society is now constituted, these people, acting more or less in their individual capacities, may be said to constitute the normal opposition to progress. Of all the civilized countries of the world, the United States has the peculiar and questionable distinction of having these elements organized into a nation-wide movement to defeat, not only the

medical inspection of schools, but all other statutory efforts to prevent disease and promote human efficiency thru the observance of hygienic law. These people, in their organized capacity, having raised the shibboleth of "Medical Freedom," are engaged in an active propaganda to impose the tyranny of their selfish interests upon the people. The movement was instigated by a man long identified with medical methods outlawed by legislation that the people have wisely enacted for their own protection. He is now using the organization as a medium for the free advertisement of his personal journalistic enterprise. With him are individuals who fattened on the sale of enslaving nostrums, others whose welfare depended upon the sale of doped foods, two classes of individuals that are naturally enough arrayed against the pure food and drug laws of the states and the nation. Among them are a few physicians of questionable antecedents, who openly base their opposition upon the declared apprehension that their particular "ism" or "pathy" may not be duly represented in the administration of these beneficent health measures. Another element of the organization is made up of those who oppose health legislation and thus favor the spread of disease that they may make money by imposing upon ignorant credulity the ridiculous doctrine that there is no such thing as disease.

With men capitalizing human credulity for the promotion of their publication enterprises; others to sell nostrums and impure foods; others to bolster up waning professional fortunes; others to promote revenue-yielding cults—I say, when we see all these elements with their blind but well-meaning followers banded together under the banner of "Medical Freedom," and directing their energies to the defeat of the medical inspection of schools, and other health measures, we are justified in charging, as I do charge, that the organized opposition has resolved itself into a conspiracy to propagate disease for commercial purposes. In carrying out their enterprising exploitation of the people, in their effort to increase the death-rate among children, in their effort to spread disease and dependency among all classes, thus to increase their personal gain, it is but natural that they should seek to hide their real purpose behind a false issue. They have raised the cry that the meaning of all this health legislation is to deprive the individual of his right to employ the physician of his choice, and on this falsehood, they have solicited and received contributions to their corruption fund. This fund has been and is being expended in large amounts to pay an army of canvassers, to print false and misleading literature, to buy up the press, to employ otherwise respectable lawyers as lobbyists, and in various other ways to influence legislation adversely to the health interests of the people. I am not prepared to state to what extent, if any, the large funds of this organization are being diverted to the immediate personal profit of the promoters. They might well waive this bagatelle in view of the larger stake for which they are playing—a stake represented by hun-

dreds of millions of dollars in the capitalization of enterprises that either have been or are rapidly becoming contraband of law. I make no mention of the similar sums reaped or sought to be reaped under the guise of "fees" by these thoroly parasitic classes.

In it all, however, may be seen the substantial reason underlying the "organization," to counteract the disastrous results of whose methods it well behooves the two altruistic professions of education and medicine to work hand in hand. The effective remedy is to be found in universal publicity.

Carry the message to the people.

E. SOME PROBLEMS IN EDUCATION AS RELATED TO THE PUBLIC HEALTH

HARVEY W. WILEY, CONTRIBUTING EDITOR, "GOOD HOUSEKEEPING MAGAZINE," WASHINGTON, D.C.

One of the most important problems of education is found in the proper nutrition of the child. Poor food, badly cooked food, deficient food, and excessive stimulation unfit children for proper mental growth and physical culture. Let me care for the health of the children and I don't care who doctors the adults. I shall not undertake tonight to discuss this question in much detail in the few minutes which are assigned to me. I will mention only the high points, the *fastigia rerum*. It is a lamentable fact that in many of our city schools, especially, children are at a disadvantage by reason of improper clothing and the necessity of doing without nourishing food, especially at luncheon hour. In some cities attempts have been made to remedy some of these deficiencies, especially those relating to poor luncheons. In the city of Washington the school authorities established a number of tables where a simple but nutritious lunch could be bought for a penny by some of those who were unable to bring proper food from home. Where this experiment has been tried it has been the universal consensus of opinion that the scholarship and deportment of those who received these simple benefactions have been improved. To show the hold that mercenary interests have on the country I may say that, when these attempts were made in Washington to supply wholesome and nutritious luncheons to the poor children, protests were made by dealers in candies, etc., in the vicinity of the school against the practice, on the ground that serving the luncheon in the schoolroom prevented the children from coming into their stores and buying the stale things they had on sale. Happily this commercial objection did not succeed in breaking down the plan adopted by the school authorities in Washington.

The proper kind and amount of children's food is a matter of tremendous importance but I will not take further time for it now. I have a

more important message to present, at least, in outline, namely, that condition of school children, which for lack of a better term, is called nervousness. What is it that has ruined the children's nerves? In my opinion it does not as a rule come from overstudy, tho occasionally that might have been the case. The trouble with the children of this country is that after the manner of their parents they are also subjected to exhilaration by stimulants of various kinds, which have no food value and can work only injury to the child. I refer especially to coffee and tea obtained at home, the acquisition by boys of the tobacco habit, and the indulgence by boys and girls in the so-called soft drinks at the drug-stores, which contain cocain or caffein. Fortunately the effectiveness of the campaign against cocain has driven most of the beverages containing it from the soda fountains, but this is not true of those containing caffein. The drug division of the Department of Agriculture secured the names of over one hundred so-called soft drinks sold at soda fountains which contained either caffein or cocain or both. As a rule no soda fountain sells over two or three of these soft drinks but they are offered in the large numbers which I have mentioned in the various parts of the country. Inasmuch as everyone has agreed that cocain is a substance to be kept out of foods, I shall confine my remarks solely to those products containing caffein. The health officers of Washington issued a letter of caution to parents, in which it was urged that they should not allow their children to use tea or coffee at home. Nothing was said in this circular, however, about patronizing soda fountains where beverages containing caffein were sold. In point of fact, it is commonly admitted by experts that caffein-bearing beverages taken upon an empty stomach are more injurious than the same amount of caffein would be consumed with meals. Now the consumption of tea and coffee at home with meals is less dangerous than the drinking of caffeinated beverages at the soda fountains. The name of one of these beverages most frequently found is coca cola. Indeed it is somewhat rare at the present time to find a soda fountain that does not sell this beverage. A glass of coca cola contains about the same amount of caffein as a cup of tea or coffee, and children in drinking this are doing the very thing their parents would not have them do if they knew it. The authorities should be as careful to caution against the use of coca cola as against coffee and tea. It is bad enough for grown people to drink these beverages, without offering them to children.

But there is another reason why the children suffer with that indescribable condition which, for lack of a better term, is called nervousness. While we do not inherit infectious diseases and nervousness itself, we may come into the world with an inheritance which is favorable to the breaking-down of the nervous system. Why, may I ask, is this the case? The answer is obvious. We are the most bedrugged nation of the earth. If you are suffering with a bad cold and start down the street every friend

you meet has some remedy to offer which is sure to cure. You are dosed with physic for the least ailment. Men and women are victims of morphin, codein, heroin, cocain, chloroform, and cannabis indica. They are saturated with tobacco and alcohol and this added to the everlasting drugging is entirely sufficient to account for the destruction of our nerves. They cannot resist the bombardment.

How often do I hear the phrase, "I can drink a strong cup of coffee with no ill effect." The same excuse is urged for the use of alcoholic beverages. "I drink a glass of beer, or wine, or whiskey, without feeling any ill effect," says the one who is addicted to the drug habit. "I never become intoxicated," but it is not the fourth or fifth drink of whiskey which intoxicates—it is the sum of the first, second, and third drinks. If there is no foundation there is no structure. Because the injury is not measured by an ordinary rule of dimensions, is no reason that it does not exist. The result is that not only are our children subject to all kinds of nervous defects but the grown people even more so. Often is it said that these stimulants are useful for mental effect; learned men have recently written treatises at the instigation of the Coca Cola Company to show that caffein is positively beneficial. A story is running thru one of the magazines showing that the brilliant playwright cannot produce a striking success except under the influence of alcohol. All such stuff as this is merely illusionary. Neither coffee, nor tea, nor tobacco, nor alcohol, nor opium, nor cocain, nor hasheesh ever produced a brilliant thought. They sometimes cut loose the sense of responsibility and make one feel as if he were a genius, but they do nothing but harm. The inhabitants of the Grecian peninsula owed nothing of their genius to any of the dopes mentioned above. The world would be better today if coffee, tea, tobacco, alcohol, morphin, opium and its derivatives, cannabis indica, acetanilid, and all their progeny, relations, and asymptotes were blotted from the face of the earth.

But it is not for me to describe what men and women of mature age shall eat, drink, and smoke. My duty is to save, if possible, the children. If we can save the children, all right we need not have much fear of the men and women that come after. They will be strong, self-reliant, and capable of taking care of themselves. My plea, therefore, to the teachers of the nation is to join in the great work to banish from the menu of the child every single substance which hits the nerves, excites undue activity, or produces unnatural stimulation, and substitute in its place a wholesome, nutritious, plain, simple diet, which may enable the child to grow and become a healthy and valuable citizen.

TOPIC: RURAL LIFE CONDITIONS AND RURAL EDUCATION

A. A SOCIAL AND EDUCATIONAL SURVEY OF THE RURAL COMMUNITY

WARREN H. WILSON, SUPERINTENDENT OF THE PRESBYTERIAN DEPARTMENT OF CHURCH AND COUNTRY LIFE, NEW YORK, N.Y.

A great French observer declares: "The Anglo-Saxon has two passions; the love of land and the desire for education, and the desire for education is the greater." At the present time American country life is a field of conflict between those two passions. To find better schools the farmer has deserted the country, because the schools in the open country are inadequate.

We have been making a scientific survey of country conditions to discover what ails country churches and schools. We have studied the one as thoroly as the other, and all the churches with equal care. Our examination has covered economic, social, educational, and religious factors of country life. These surveys have covered seven counties in Pennsylvania, three in Indiana, thirteen in Illinois, three in Missouri, and one each in Kentucky, Tennessee, and Maryland. We are now engaged in the study of rural conditions in the whole state of Ohio and this fall will be prepared to report on about twenty counties in that representative state. The church and school in the country are the institutions whose condition indicates the welfare or the decadence of the country community. For the church and the school are the eyes of the country community.

The first thing we find in the country is that rural life is organized by labor alone. Nobody stays in the open country except to work. The movement "back to the land" has no influence on the rural problem. The city man is an alien. He cannot improve the churches and he cannot direct the schools because he does not get his income from the land as farmers do; and they will not accept his leadership. In the country itself the only class of men who are generally retained in the open country is the working farmers. The merchants have gone to the town and the country stores are closed. The blacksmith shop is at the village and there are collected all those agencies of country life such as lodges, insurance companies, fertilizer stores, feed-stores. Everything except the factories where the machinery is made is in the village and the town; and those factories are in the big city.

The school-teacher and the preacher do not live in the country. The modernized school goes no farther into the country than the big village. With the exception of a few consolidated schools it is not to be found in the open fields. The rule in the country is the one-room school, taught by an untrained woman who remains at her post not more than a year. The preachers are little better; for they do not live in the town where they generally preach and they preach in the country where they do not live.

The causes of this industrializing of the open country are: First, the exhaustion of the free land in the West, causing the farmer to work harder for a living on impoverished land. Secondly, the first values of the land are exhausted and the farmer must deal with marginal values now, for which he has no adequate education. You do not need to be trained to pick up initial values from a virgin soil, but to farm a land when the first values are exhausted requires a trained mind and a skilled hand. But the main reason for the laborious character of farming is that in recent years the farmer, who used to live on his products, has come to live on his profits. He used to be a producer of what he required, but now he is a consumer and purchases nearly all the necessities of life. He no longer wears his own wool or linen or leather, nor eats his own meal or meat; this means he must live on his profits. To have an adequate profit he must necessarily work harder than his father did.

This labor to which country life is devoted, hard as it is, does not produce enough to feed the country. I will not dwell long upon this, for others have made it so clear that I can hasten. But this country, which twenty years ago was exporting corn in vast quantities, has steadily decreased her exports until in a few years, unless we learn better how to farm, we shall be an importing nation buying our food abroad. Already we are purchasing potatoes from Scotland and other kinds of raw material from countries whose soil has been tilled for a thousand years.

This is a serious issue, for in the next thirty years we must double the total of food products used by the people. The last time we doubled our food and raw material needed, we accomplished it by doubling the acreage of land under cultivation. This we cannot do again. We must now double the quantity raised per acre, if we are to continue to feed our own people, in this great and newest continent of the world. To do so the school must be near at hand to the farmer, in which he can learn the secrets of better agriculture.

The labor on the farm is not only deficient in production, but it gives an inadequate profit. I know well that I am speaking in Illinois, and you think that this state is rich, you boast of the profits which farmers are making. But what has happened is this: the price of land has indeed gone up, while the value of land has gone down. Land which in Illinois used to raise with indifferent farming ninety bushels per acre is producing now with better tillage fifty bushels of corn per acre and a little less. But in the mean time, while its actual value for producing food has gone down so rapidly, its selling value has increased from $60 per acre to $175 per acre. It is producing less but it sells for more.

Now this lack of income from the land is the trouble with the country community. The farmer can make less, but he is constantly offered more for his land. On this price the actual interest he can make on his money invested, in many Illinois farms, is reduced to about 2 or 3 per cent. He

knows that he can sell his farm at any time, deposit his money in the bank, and receive the same or more as an interest payment, without working twelve hours a day.

This trouble is increased by the fact that many city people want to dignify themselves with farm land. They are putting their money into farms at a price which forbids a bigger income than 3 per cent on their money. They want to feel that they are proprietors. But the farmer must compete with them and he is unable to live on a 3 per cent income. So that these absentee owners are depressing country people by preventing the ownership of land by working farmers.

But if you believe that farmers have adequate income, I refer you to the survey recently made at Cornell University, which showed that the farmers around that splendid institution, devoted to helping the farmer up, get an income of less than $1.20 per day for their work. Henry C. Wallace, of Des Moines, recently declared that in the state of Iowa the profit on farms was measured by child labor put on the farms. In the city we think it disgraceful that a child should work, but in such a rich state as Iowa the farmer's only source of income in average instances is the labor of children. I might go thru instances, and I admit that this question is now under investigation; but I begin to believe, for my part, what the farmer says when we go to him to propose the improvement of schools or churches or roads in the country. His reply is: "I cannot afford it," and I cannot but believe that the farmer is telling the truth.

The principle is this: social improvement cannot be paid for on credit, but productive improvements can be. As the selling price of land goes up the farmer's credit is increased, he can borrow more at the bank and with this money he can build silos, buy blooded stock, fertilize and drain the land, paint his barns, and if he lives far from town purchase an automobile. All of these are productive improvements and can properly be paid for with borrowed money. But churches and schools and better roads are social improvements; they can be paid for only out of the profits. You and I have no right to ask a farmer to mortgage his land in order to consolidate the schools or to raise the minister's salary or to support a missionary in India. These needs must be paid for with that money which is over and above all fixed charges and all expenses, including the interest on his invested capital. So that as the face value of his land goes up it does not increase his income nor enable him to pay for social improvements. Instead it diminishes his labor income.

This results in the condition you see thru all the Middle West. The farms are improved, the houses are painted, the barns are repaired, good machinery is everywhere, the quality and the grade of live stock are higher, but the churches are neglected and the schoolhouses are out of repair and the roads are hopeless. What else could you expect in a country where the prices of land have gone up and the income from land is but little if at all improved?

The result of this we have found in the increase in the proportionate number of renters who own no farm land. Are you aware that in this splendid central state of Illinois, in the corn belt, 53 per cent of the farmers in the country are renters? We know it too well who have churches to care for in the country, because the renter has only a one-year lease. His average tenure thruout the United States is two and a half years. We are finding that in Ohio he stays on a farm two and four years. But, however long he stays, the American renter has no legal right to the land for more than a year. The law sustains him only while he is raising one crop. The laws of this country have made no allowance for a renter. He has no especial standing before the courts. The lawmakers in none of the states expected that an American farmer would ever be anything but an owner of the land he tilled. Yet thruout the country as a whole four farmers out of ten are renters on one-year leases.

Now, there is nothing wrong with the tenant. He is as good a man as the owner. It is the condition, not the man, that determines the social institutions in the country. My people have been renters in Ireland for three hundred years and have lived on one piece of land, supporting the same church and the same school. But the American renter is a nomad. He moves constantly. He is an outlaw because there is no place for him in the legal system of state or nation. He has no legal right to the fertilizer he puts in the soil. The result is that he fertilizes not at all and robs the soil as a custom.

The renter of the land needs a better school for his children than the owner does because his family life is poorer; the wife is harder worked; the husband and father has heavier burdens and anxieties than the owner has. They need a better pastor and a better teacher; but they are unable to supply themselves with as good a church or as good a school as the owner can. So that the whole system in the country, unless it be helped thru changes of our laws, and especially thru a better school and a better church than we now have in the country, will tend downward. The danger at the present time is very great. Remember that our system of tenantry in America is worse than that in any country in Europe. We are defended from the ill condition of England, Ireland, or Germany only because our soil is still younger and is not yet fully exhausted.

In this condition, the one-room school renders no help whatever. The teacher herself is an "absentee," teaching in the country while she looks for something better. Seldom does she stay longer than a year. I was informed that in Georgia 88 per cent last year of the country school-teachers were each teaching for the first time in that school. In many of their schools the condition among the children was even worse; as for instance, in one country school of 27 children, 25 were newcomers who had not been there the year before. This was due to the renting system in a state where above 60 per cent of the farmers are renters.

But the trouble with the country education generally is a wrong principle. The notion is to make the boys and girls into gentlemen and ladies. The teacher says she is there to "train personality" just as the preacher declares that his only business in the world is to "save souls." The country school in this particular boasts of the number of scholars it "has turned out." They tell of judges and generals, governors and great men of varied lines who went thru their schools. But the school is not tested by the brilliant people who happen to have escaped its influence. It is tested by the dull people who are dependent upon its influence. The New England states exhibit in every town the evidence that the one-room country school gives very poor education to those who get nothing better. Communities that have "sent out" so many brilliant people are sorely in need of the leaders and geniuses whom the country school inspired with a desire to get away from the farm.

The farmer cannot reform his own schools. We might as well understand that at the beginning. The country school must look for its renovation to the teaching profession. The task of farming is too great and the transformation thru which it is now going, too severe for the farmer to think of anything but selected seed, silos, test of cows, and the spraying of orchards. It is the business of such a body as this to forward the reform of the country school. Let us be perfectly sure that the farming occupation itself gives no promise of educational reform.

The school needed in the country is now clearly indicated. If you will give us such a school as this, I am sure that we shall give you a successful country church. I care not of what denomination we are, we wait for the service of the teacher, before we can build permanent social institutions in the country. First, the country school of the future must teach the book of Nature. Botany must be taught, not as I learned it, a glossary of Latin derivatives to be studied, a lens, blotting paper, and the co-operation of a pretty schoolmate; but botany means corn and potatoes, and to teach any other kind of botany in the country, to fail to tell the country boy that corn and wheat are flowers, is to betray and to impoverish the farmer. Whoever robs the farmer robs the whole country.

The country school ought to teach the child about the birds that fly overhead, the farmers' friends. It ought to teach the nature of the soil and educate the American school boy so that he will know as much as the Danish peasant. For the poor Dane brought up on a swampy farm of ten acres under the North Sea can analyze his own soil and test his milk for butter fat; he can cure his own bacon better than Armour and Swift can. They have no trusts in Denmark because the farmer is educated.

Secondly, the country school of the future will teach all of the children. It will not attend only to the geniuses nor spend time on the boys that are going to the city or to college. It will set its standard by the boys of the local community and the girls who are going to live happily and with profit in that place.

The country school that is worth the farmer's money, in the third place, will be in the center of the community, will cultivate recreation and social life and by this means contribute to the social training of the children.

Fourthly, the country school, whatever it be, requires close supervision by experts, not elected but appointed, in order that the individual teacher may have behind her not a careless committee of country directors or a place-seeking politician, but a trained supervisor who will give continuity and character to her work.

For my part, I believe that this burden of educating the farmer for present-day needs cannot be borne by the one-room school and the lone teacher. The institution is inadequate to the strain put upon it. We need the consolidated rural school in the country, where out in the open country three or four teachers, with a principal, trained for their work and well paid, with an adequate plant to work in, shall educate the children of the whole countryside. These children shall be brought to the school in wagons. Instead of ten indifferent, poorly trained teachers, I would substitute four teachers and four wagon-drivers. There you have an institution adequate to the needs of country life.

But whatever be the form of the school needed in the country for the support of a rural community and the improvement of the condition of the farmer, I believe this formula will describe it: The country school should be such as to educate the farmer's son and daughter until eighteen years of age, in farming and in country life, while they live at home, sleep every night in their own beds, eat every morning at their mother's table. Nowadays, for agricultural training, the boy has to go to the city or the girl must go, for normal training, far away from home: and they never come back. But the school I have described will build up the community. The teacher and the parent will co-operate in the education of the boy and the girl to honor the father's profession, not to despise it; and to follow the profession with profit to themselves and with abundant provision for the rest of us thruout the country. Thus the cost of living will be lowered because the education of the most fundamental occupation of all is made productive and profitable by a good country school.

B (1). WHAT IS BEING DONE TO MEET THE PROBLEM BY THE SCHOOLS OF GUILFORD COUNTY, N.C.

T. R. FOUST, COUNTY SUPERINTENDENT, GREENSBORO, N.C.

Guilford County, North Carolina, is situated in the central part of the state and has an area of 672 miles which is practically in the form of a square. Its population is 64,000. Of this population 25,000 live in the cities and 39,000 in the country. Last year the rural school fund was $105,000, and with this amount the rural schools of the county were in

session for an average of 119 days. Our rural schools are supported by what is known as the general school fund, and then each township or school district is permitted under the law to levy a special school tax, provided a majority of the people will vote in favor of said levy.

About ten years ago a real interest was awakened in the development of the rural schools, and a campaign was inaugurated to encourage the people to vote a special tax in order to lengthen the school term and secure better teachers and equipment. This movement gained rapidly and the county now has over two-thirds of its children in the rural districts attending schools which are supported in part by a special levy. This increase of the school fund has enabled the county to build good houses, to furnish good equipment, and to employ better teachers.

With this agitation for a special tax levy in the various school districts of the county has come a real awakening of the people, and, whereas they were formerly content with a four months' school, now a great many communities run an eight months' school and are not satisfied with less. The old idea in the South, that four months is as long as a farmer can spare his children, is fast disappearing and the reports which come into my office show that the long-term schools of the county are the ones which have the highest percentage of enrollment and attendance, based on the school census. Furthermore, these special-tax districts are larger than those which do not have a special school tax, and, consequently, the children must travel a greater distance in order to reach the schools. This proves conclusively that it is not a question of distance, but the quality of the school that determines the regularity with which pupils attend.

Co-ordinate with the agitation for better rural schools came the agitation for better roads, and ten years ago the county voted a bond issue of three thousand dollars to be spent in building permanent macadam roads in the county. This bond issue has been entirely spent and the county now has over one hundred miles of permanent road. The Board of County Commissioners is each year building approximately ten miles of permanent road out of the money which comes from a special levy for road purposes.

While these two movements indicate that the people of Guilford County are progressive, yet rural statistics show that the country people are deficient in three particulars:

1. There are too many cases of typhoid fever and other preventable diseases each year.
2. The average farmer needs a training which will the better equip him for his work.
3. The average country woman needs a training which will enable her to keep the home better and more economically.

Two years ago there was held a joint meeting of the Board of County Commissioners and the County Board of Education to discuss these features of rural life and to devise some plan whereby they can be improved. After several meetings it was decided to secure from the legislature of North

Carolina such laws as would enable the boards to spend the proper amount of money in developing the people of Guilford County along the lines that I have indicated.

The legislature of North Carolina passed a law which enabled any county of the state to employ a superintendent of health to give his whole time to the health work of the county, provided the Board of County Commissioners would appropriate a sufficient amount of money to enable the Board of Health to do this. The Board of County Commissioners of Guilford County readily agreed to appropriate the money and instructed the Board of Health to secure a competent man for his entire time. In addition to the usual duties required of the county superintendent of health, he must deliver lectures in order to educate the people along the lines of sanitation and health, visit the schools while in session, and suggest to parents the treatment that it is necessary for the defective child to have, issue health bulletins, and write newspaper articles to be circulated in the county.

During the past school year each teacher was required to report, on a card furnished for that purpose, a list of the children who had some apparent defect. Ten per cent of the children who attended school had some defect which was so pronounced that even a layman could detect it. When the superintendent of health visited the school he called for those children whose names had been furnished by the teacher and gave them a thoro examination. When he reached an opinion as to the cause of the lack of physical development, a card was sent to the parent suggesting the treatment that should be given. Dr. Ross, the superintendent of health during the fall of 1911, delivered lectures in various parts of the county and had stereopticon views illustrating the four principal diseases which lower the vitality of our people and cause the most deaths. These four diseases which he illustrated by slides were tuberculosis, smallpox, hookworm disease, and typhoid fever.

The Board of Education of the county and the people for several years had realized that the schools of the county ought to be the means in helping to solve the problems which confronted the farmers and their wives. Two plans were suggested. One was to establish a distinctively agricultural school at some central point in the county, and make it the means of dissemination of knowledge in agriculture and domestic science thru its courses of study and extension work by the teachers in this school; the other was not to establish any distinctively agricultural school, but to do the work thru the high schools which were already in existence by adding courses in agriculture and domestic science to their courses of study. After a thoro consideration of this important question the Board of Education reached the conclusion that it would be better not to establish any separate schools but to use those which were already created and to work thru them. The board did not believe it wise to adopt a system which

might ultimately result in two systems of schools when we are not able to adequately equip and properly support one system. They furthermore believed that the establishment of a distinctively agricultural school in the county might lead to class schools rather than having one system which would train all the children along various lines. Having reached this conclusion, the Board of Education prepared a bill for Guilford County and secured its passage by the legislature of North Carolina in 1911.

By this special act of the legislature the County Board of Education was permitted to make an appropriation for the work in agriculture and domestic science. The state duplicates the amount appropriated by the Board of Education. Beginning with last year, courses in agriculture and domestic science were made a part of the curriculum of three high schools in the county. Each of these schools runs eight months, has a farm of ten acres, laboratories, and equipment for prosecuting work in agriculture and domestic science. We now have in charge of the agricultural department of each of these schools a competent man, and in charge of the domestic science work a competent woman. Our law requires us to employ as teachers of these departments only those who have had special training for the work. In addition to the work in the schoolroom each of these teachers is required during the summer vacation to do extension work in the county. The county is divided into three parts and the teacher of agriculture at one of these schools is expected to do extension work in one-third of the county. This extension work consists in holding meetings with the farmers in various sections of the county; getting the farmers to visit the school farm in order to get the benefit of the demonstration work; visiting the farmers at their homes and helping them to solve the problems which arise on the farm. Each domestic science teacher has charge of the extension work among the women in one-third of the county, and during vacation she is to hold mothers' meetings, and to give instruction in home-keeping and home-making.

We find that both men and women are anxious to improve upon what they are now doing and do not at all resent suggestions from those who have had special training in those lines of work. The real test of the effectiveness of the work, both in agriculture and in domestic science, is the effect that it has upon the home life. We find that boys who have been using the Babcock tester during the past year at school have for the first time been brought to the realization of the difference there is in milk. They have learned from tests, which have been made at the school, that two cows which have a very similar appearance and give practically the same quantity of milk may vary considerably in the amount of butter fat which they produce.

As these schools are open without tuition to all boys and girls in the county who are prepared to enter the high-school course, and as some attend from almost every section of the county, we believe that the influence

of these schools is going to be felt in practically every neighborhood in the county. These boys who are receiving instruction in agriculture in the school during the winter are going to the farms and work there during the summer. They will put into practice some of the things which they have learned in the school, and their fathers will be given the benefit of their training right in the home. What is true of the boys is equally true with reference to the training which the girls will carry into the home. One day last winter, just after I had left one of the schools in which the domestic science department had given a luncheon, I met a man at the railroad station who had two girls in the domestic science class. I asked him if he could see any difference in the attitude of his two girls in the home since they began taking domestic science work in the school. He replied that there was a marked difference and mentioned especially the bread which the family is now eating, contrasting it with the old-fashioned soda biscuit which had formerly been made in the home. Upon further inquiry I learned that the whole community had practically abandoned the old-fashioned soda biscuit and are now eating the wholesome Parker House rolls instead.

Last summer twelve varieties of peas were planted side by side on one of the farms in order to determine which variety is best suited for particular use in our section. The boys were carried to the farm and there saw a marked difference between the various varieties as forage-producers and those which produce more fruit and less forage. The farmers of the neighborhood were also carried to the farm in order that they might see what a difference there is in variety when given the same cultivation on the same land.

It is not our intention to do experimental work on these farms, but rather demonstration work. High-school pupils are not prepared to do experimental work because they are prone to reach a conclusion too quickly, but, by using these farms to demonstrate what has already been proven by experiment, we hope to get the farmers of the county to follow approved plans and thereby materially increase the amount which is raised per acre.

As I said in the beginning, last year was our first attempt in the three lines of work, health, agriculture, and domestic science, and one year is a short time in which to show any marked change, but we do believe that by and thru these lines of work we can materially increase the efficiency of our people. We do not believe that agriculture should be given to the boys and domestic science to the girls solely for the purpose of making farmers and home-keepers, but we do believe that we can better train the boys and girls by giving them these courses in which they have had some former experience and in which they are more interested than we can by giving them the old standard courses of study. We are not in favor of eliminating anything that has been given for its training and cultural influence, but we do believe that the rural boys and girls should be given

the opportunity of selecting those things which pertain more directly to the home life. Two courses are given in these rural high schools, and we have found during the past year that over half of the pupils in the high schools desire to take the more practical course.

While material prosperity is not the end of education, yet the more prosperous and healthy we can make the rural districts, the more able these people are to have the proper system of schools and to bring into the home those things which have an elevating and refining influence. A great deal of the farmer's work is now lost. It is not an uncommon sight in this country to see an entire orchard ruined because the farmer does not know that it is caused by a disease which is so easily prevented. It is the business of the rural high schools so to train the boys and girls that come under its influence that they will not permit this waste on the farm and in the home to continue. It is also the business of the rural high school, thru its extension feature, to teach the farmers themselves and their wives how they can better solve the problems which confront them.

B (2). WHAT IS BEING DONE TO MEET THE PROBLEM BY THE STATE OF OREGON

L. R. ALDERMAN, STATE SUPERINTENDENT OF PUBLIC INSTRUCTION, SALEM, ORE.

The state of Oregon is divided into two distinct parts, the Cascade Mountains forming a natural boundary between the two sections. There are two processes of evolution going on in the state, the one tending to consolidate farms, the other to intensify cultivation, and divide them. In eastern Oregon in the non-irrigated sections, improved machinery makes the consolidation of many small farms into large tracts profitable. One man with a caterpillar engine or a large team does the work of many. One farmer buys out his neighbor, houses are far apart, and were it not for automobiles, country life would be very lonely. However, irrigation is rapidly spreading thruout these dry sections, making conditions very favorable for community life. Here the population is becoming more dense, and rural conditions are improving. In western Oregon the abundance of water supply, and equable climate make country life conditions, as far as the physical side is concerned, almost ideal.

Yet in Oregon the general trend of population follows that of other states, from the farm to the town and city. But little more than a third of the population of the state lives on farms. The city attracts. We are social beings and like to meet our fellow-men. There are many thoughtful men who believe that in the country is the place to live and bring up a family. Many educators believe that the country boy and girl, growing up with many responsibilities, are the ones who really do things in life.

But too many in the country are leaving for the city. They go because country life does not appeal to them. The problem, then, is: Make country life more attractive.

The way to solve the country life problem must be found in the main by the country-dweller. No set of resolutions adopted by a general conference can be effective. One reason why being a producer is not more attractive is because the producer receives only about 40 per cent of what the consumer pays for the same products.

In Oregon we do not claim to have solved the country life problem, but we have several things which I think are worth calling to the attention of the National Education Association. They are our rural high-school law, our supervisory law, our state-wide children's industrial contest, and the new experiment, school credit for home work.

County high-school fund law.—Many people in the country have a great desire to give their children a high-school education, and in order to do it, they will go to the high school, if the high school is not brought to them. A canvass of our city and town population will show a large percentage of people who are there to educate their children. In Oregon, in many counties, it is not necessary to move to town for this, as the high school is brought to the country. The ideal is a high school within riding-distance of every home, so that the child may be in his home at night. Lane County has eighteen high schools, only one of them being in a large town. Eighty-five per cent of all the Lane County eighth-grade graduates of the years 1910 and 1911 were in high schools in 1911–1912. This record challenges comparison.

The law fosters high schools thru the following provision: Each of the first twenty pupils in a high school draws $40 from the county high-school fund; each of the second twenty pupils draws $30 from the fund; and each pupil over the first forty draws $12.50. The tax for the fund is levied on all the property of the county. In most cases the amount does not exceed one-half of a mill. This is a state law made operative only by a vote of the county.

The rural high schools have a wholesome influence on the rural grammar schools, as each child wants to enter the rural high school as soon as possible, and to do so he must make his grade each year. It has been noticed that the attendance in the grades improves when a high school is established.

The supervisory law.—By the old order of things, the more poorly prepared a teacher was, the farther into the country she was sent, and the less supervision she received. Under the new order she is sent just as far, but someone is sent after her to help her. By the Oregon plan every rural school in the more populous counties has a supervisor visit it at least every six weeks. This law has been in operation only one year, but a great change has been noticed already. Sanitary conditions improved at once. Hundreds of wells were cleaned and properly curbed. Faucets from small

drinking-tanks, and nidividual cups replaced the old pail and common dipper. Walks and outhouses were improved; stoves were furnished with jackets and ventilating shafts; better lighting was found possible even in old schoolhouses. The supervisor, visiting the people often, reinforced the teachers' requests, and stimulated a greater interest in the school than the teacher alone could possibly awaken.

But the main thing hoped for and already noticed is the improvement of the teacher in service. The idea is that every teacher be helped so that she may be a year's better teacher at the end of each year. The right suggestion at the right time means in many cases the difference between success and failure.

Our supervisors are selected by a board of five, consisting of the county superintendent and four people selected by him. Only those counties that have sixty or more districts have supervisors, and no supervisor may have more than fifty nor less than twenty districts under his or her charge. The minimum salary is $100 per month for ten months.

Industrial contests.—Believing that the main thing in education is habit-building, and that industry is largely a habit, we have this year launched industrial contests in every county in the state, in connection with the local and county fairs, culminating in the state fair. The State Bankers' Association, the Live Stock Association, the commercial clubs, the women's clubs, State Teachers' Association, county superintendents, parents, teachers, and children are co-operating in this movement, and as a result we expect to have as many as sixty thousand children exhibit something grown or made by them. Four thousand school children in the city of Portland had gardens this spring. Thousands of children are raising chickens and hundreds are owners of pigs. A boy who had won a pig at a fair was asked how his pig was this morning. He replied, "He's all right—how are all your folks?" There is something educative about the care of animals. It broadens one's sympathies. Giving one life into the care of another brings a responsibility that nothing else does. Someone who has taken the trouble to go thru the penitentiaries of the country reports that not one in ten of the inmates ever had a pet to care for.

But the best thing about industrial work is that it brings the boy and his father nearer together. I know two farmers, neighbors; twenty years ago their circumstances seemed very much alike; one of the farmers let his boy have a piece of land, and time to plant and cultivate it himself. He felt that he and his father were in partnership together. When he harvested the crop, he bought the kind of clothes he liked, and had spending money left over. He would talk over his interests with his father as to a comrade. This boy and his brothers are on the place yet. One is building a home near his father's house. The family is happy and prosperous. It is just such a place as one likes to visit.

The other farmer has a fine farm, but he did not take his boys into his

confidence. They felt he wanted from them only what work he could get out of them. They are all gone. He is known far and near as a hard driver, and many of his neighbors are unkind enough to say it is his hard driving that makes him so lonely now.

I have seen fathers this year pat their boys on the head and say, "John has a fine garden," and I have noticed that John almost breaks the top button off his vest as he swells up with pride. That is worth while.

In Yamhill County they have had a school fair for seven years, in other counties for four years, with an ever-increasing number of exhibits, and ever-increasing enthusiasm. Prizes are given for garden products, for cooking—usually bread, jellies, and canned fruits—for sewing, mending, and for butter-making, and carpentering, as well as for pigs and chickens. Generous prizes have been contributed, amounting to $20,000 this year thruout the state. This is partly cash, and partly those things that attract children—such as pure-bred animals, saddles, writing-desks, Shetland ponies, etc.

All this work is home work, in the case of the country children. The school organization, for the present, acts only as a stimulus and a means of communication. Local volunteer committees are formed to encourage the children after the schools are closed for the summer.

School credit for home work.—A few schools in Oregon carry the idea of encouraging industry still further by giving credit for it every day in the school. This plan was been worked out with wonderful enthusiasm by pupils and parents. Some measure the work by hours—or minutes—of home labor, a certain number of minutes being assigned for each task, and a report sent in signed by the parent certifies to the number of minutes' work done each day. Then there are holidays granted for so many hours' work each month, and prizes at the end of the term to those who have the greatest number of hours' work to their credit. Another method is to have the home work marked by the parent, and as much credit given as for any one study. In either case, the child is brought to realize that home work is important. He learns that there is a pleasure in responsibilities. He likes his home, and if it is on the farm, he becomes interested, and wants to stay there. The effect of this industrial work on school work is entirely good. The schools that are accomplishing the most at home are delightfully wide-awake in school hours, and have enviable records for scholarship.

Another condition developing in Oregon is the new feeling of unity and co-operation in rural neighborhoods. This is fostered by the country high schools, which serve as the best type of social centers, forming the nucleus of a larger and more public-spirited country neighborhood. The activities of these high schools attract the adults, and the sheds that shelter the pupils' horses in the daytime shelter the family team during the evening meetings, while the parents mingle with the children in debate, lecture, or social gatherings. A high tone is given to these meetings by the very place

in which they are held, and the people appear at their best, for I believe that the happiest social gatherings are those dominated by some appeal to the intellect. In my opinion adult education in country or city has wonderful possibilities. Again, athletics are drawing the adults together, so that practically all in the country are out Saturday afternoons to witness the ball game between the rival high schools. When country life loses enough of its strenuosity to permit this in the busy springtime, when it will induce the farmer to drop his plow, and mix with his neighbors at a ball game, and yell like a human being, it shows signs of progress. I remember when I used to look at my father and wonder why he did not know that baseball is the most important thing in the world.

This spirit of co-operation is showing itself in other ways. In some communities where they raise the same kinds of crops and stock, they do not advertise as individuals, but as a community. Each farmer is interested in his neighbor's getting the best stock. Under such conditions it is a pleasure to see neighbors talking together. They see clearly that one farmer is not in competition with his neighbor, but that their best interests are in working together to the fullest possible extent.

One ideal of the Oregon Country Life Commission is to encourage real farm neighborhoods, co-operative neighborhoods, with the high school for an intellectual and social center. Another is that Oregon shall excel in the number of farm homes having running water, bathtubs, and septic tanks. We Oregonians want an Oregon farm to be the best place in the world in which to bring up a family.

B (3). WHAT IS BEING DONE TO MEET THE PROBLEM BY THE STATE OF NORTH DAKOTA

JOHN H. WORST, PRESIDENT OF THE STATE AGRICULTURAL COLLEGE AND GOVERNMENT EXPERIMENT STATION, AGRICULTURAL COLLEGE, N.D.

The time limit placed against my report for North Dakota compels me to adhere rather severely to facts, with but scant time for elaboration or comment.

North Dakota, as it is well understood, ranks with the younger states. Pioneer conditions are not yet wholly outgrown. The population of the state, tho rapidly increasing, is yet meager when the vast area of its available farming lands is taken into account. The natural resources of the commonwealth are almost exclusively agricultural. This fact suggests very clearly the character as well as the educational needs of the state's industrial population. The prosperity of North Dakota, consequently, naturally must depend upon the products of the soil and the intelligence and progressive character of those who comprise the rural population.

The culture and industrial efficiency of the great majority of our

people, therefore, must necessarily harmonize with, and bear direct relation to, their rural environment, if the business and social needs of the commonwealth are given practical consideration. The education of our children, especially those of the country districts, in large measure, must be directed toward the farm and in preparation for the best there is in farm life, if the state would discharge its obligation alike to its natural resources and to its present and future interests. The public schools should teach persons how to live, how to conserve, how to economize, and also how to spend wisely. We realize that preparation for the work of life, more and more, is coming to be the object of education. Happily the educators of North Dakota and its foremost citizens are beginning to take this practical view of education. They realize "that every race dug its civilization out of the ground"; that "practical ethics are best insured by making every citizen, at least potentially, a producer," because the wealth that supports our institutions, whether political, charitable, or educational, must come from the earth. All commercial, professional, and transportation interests of the Northwest recognize in agriculture the primary—almost the *exclusive*—resource upon which they must all depend for whatever degree of prosperity they, or the people in general, may enjoy.

As rural life and agriculture are closely correlated, it should require no prophet to forecast the importance of fostering to the utmost every available means, educational and otherwise, by which the conditions on the farm may be improved, by which rural life may be made agreeable—even attractive—for the sake of *agriculture*, because upon it the world so trustfully depends, and yet for which the world apparently manifests but little appreciation. Moreover, grave danger must inevitably result from any serious neglect of this fundamental vocation which so cheerfully bears the burden of the whole country—except as to the administration of its political offices—and yet which scatters prosperity with such liberal hand. Education, both practical and theoretical, therefore, is invoked in North Dakota for the purpose of strengthening the rural sentiment, for improving rural conditions, and for more firmly anchoring the rural families to country life. To insure this end, influences are at work to raise the standard of living on the farms; to improve the business methods of farming; to dignify and render congenial and highly intellectual the labor in the fields and with the flocks and herds, and above all, to displace the drudgery that is commonly associated with inefficiency, by substituting instead a welcome toil founded upon intelligent achievement.

Traditional education too often covers the fingers with rings, but destroys their power and ability to do things. Few people are needed in this world for mere ornamentation. The modern trend of education, therefore, is to produce useful, productive citizens.

What, then, is North Dakota doing to meet the problem of rural life conditions and rural education?

1. The Better Farming Association: This new organization is financed jointly by individuals and counties and directed by a superintendent with some thirty assistants. These agricultural experts are working directly with farmers at their homes, for the purpose of improving methods of cultivation, conserving moisture and fertility, eradicating weeds and fungous diseases, exemplifying the advantages of improved seed grain and improved live stock, determining the cost of production, and by means of experiment and demonstration they aim at placing the manifold operations of the farm upon a highly interesting as well as upon a more profitable basis.

Already increased enthusiasm is noticeable. A lively interest in improved agriculture is displacing drudgery and the application of scientific methods and modern machinery to farm management is lifting the burden from overwrought muscles, both on the farm and in the home. The growing plants and the developing animals are looked upon with new interest, while improvements observed in both plants and animals readily appeal to progressive farmers as new creations. The country home shares in the general enthusiasm. The children are beginning to look upon their parents' vocation as one of dignity and importance.

2. Mr. James J. Hill, the empire builder of the Northwest, at his own expense is having conducted hundreds of experiments and demonstrations along similar lines for the purpose of proving to our farmers that there is vastly more in rural life and in the business of farming than has heretofore been realized, and that agriculture is a vocation to be coveted rather than avoided.

3. A mass Grain and Stock-Growers' Convention is held annually at Fargo, North Dakota. This convention holds four-day sessions and is attended by an average of three thousand farmers and their wives. During its sittings every phase of rural interest, whether of the farm or of improvement of the home, is discussed by men and women of large experience and all with special reference to the betterment of rural conditions and rural education. During the last session of this association a rural life commission was appointed with authority to report a plan for general co-operation to the next convention.

4. The Legislative Assembly of the state, recognizing the importance of solving the rural life problem in part by means of vocational education, and moved largely by influences exerted by the State Educational Association, during the session of 1911 appropriated a respectable sum of money as state aid for the rural schools, providing, however, that in order to be entitled to state aid for rural schools, elementary agriculture shall be included in the course of study, and further that rural schools of the first class shall be maintained for nine months and schools of the second class for eight months each year. An inspector of rural schools also was provided for, together with salary and traveling expenses.

5. The Assembly of 1911 also subsidized five city high schools in the sum

of $2,500 each to meet the added expense of giving instruction in agriculture, home economics, and manual training, in the same thoro manner as other high-school subjects are taught. The high-school board, to which was intrusted the location of these schools, wisely ordered that these subjects only (or studies directly related to them) may be taught by their respective instructors, and that such instructors must have had special training for the respective departments over which they preside. The instructor in agriculture must hold a degree from an agricultural college, while the instructor in home economics and the instructor in manual training must each have had at least two years of special training, above the high-school grade, for their respective departments.

That the number of subsidized agricultural high schools will be gradually increased from year to year is altogether probable.

The normal schools of the state offer courses of study and training for the preparation of teachers as here indicated, except for agriculture in the subsidized high schools, while the State University and other state schools, as well as the Agricultural College, prepare teachers of agriculture, home economics, and manual training for the public schools.

6. An act was passed by the same assembly providing for the establishment of county agricultural and training schools and for their joint maintenance by the state and county and providing for a levy of state tax for the raising of funds to meet the state share of their cost and maintenance. Schools have not yet been organized under the provisions of this law, but the opportunity is open for any county that so elects to take advantage of its provisions.

7. It would, perhaps, be superfluous to add that the State Agricultural College is alive to its duties and opportunities to serve both parents and children, directly and indirectly, so far as the college and experiment stations can be of service to them. In addition to four-year graduate courses in agriculture, home economics, etc., for the purpose of training young men and young women for the teaching profession and for practical purposes, abbreviated three-year courses, requiring college attendance during but twenty-two weeks each year, are offered in farm husbandry, in home-making, and in power machinery. These abbreviated courses, designed specially for the training of practical farmers, efficient homemakers, and managers of farm or power machinery, are each annually patronized by scores and hundreds of enthusiastic young men and young women, mostly from the rural districts, who are too engrossed with home duties to spare more than a limited portion of each year in school. For such the Agricultural College feels justified in offering courses of study suited to the time and means these young people can spare and that relate directly to the lives they contemplate living and the things they contemplate doing.

In the practical courses of study emphasis is given to living as well as

to working; to the betterment of the home and family as well as to improvement of crops and livestock.

8. Winter short courses of ten weeks each are offered at the Agricultural College for boys and girls and grown-ups as well, who do not feel able or who are not ambitious to spare more than that much time from home duties. These short courses are open to all ages, and consist chiefly of lectures and demonstrations bearing upon practical farming and household affairs, and appeal strongly to those who are not accustomed to consecutive study.

9. The extension department of the Agricultural College, in addition to supplying nearly three hundred newspapers, magazines, and agricultural journals with literature and observations calculated to be of service to their rural readers as well as to make better and happier country homes, also enlists the country school children in useful outdoor and indoor exercises. These exercises have taken the form, chiefly, of corn- and potato-growing contests for the boys and bread-making and sewing contests for the girls. For the current year more than fifteen thousand boys and girls have entered these contests, generally under the local encouragement of county school superintendents, but all are directed from the Agricultural College. Many prizes for best results are offered by individuals and by local authorities and during the holiday season the prize-winners are given a week at the Agricultural College by their respective counties, where they are provided with free entertainment and daily instruction, consisting of lectures, nature themes, athletic exercises, simple demonstrations, etc., all regularly scheduled and presented in language adapted to their understanding. It is a week crowded with daily programs intended to inspire their young minds with the beauty, the orderly arrangement, and the benevolence of God as manifested in the works of Nature, and also with man's power to direct Nature's forces for his comfort and well-being. This visit to the college and the week spent there by these gaily badged and carefully chaperoned youngsters will long be remembered by them as the most enjoyable vacation of their lives. They return to their homes with keener relish for study and with profounder admiration and respect for the life on the farm.

10. Movable schools of about ten days each also are conducted by the extension department. Farmers together with their wives and grown-up children freely attend these schools and listen from day to day to the lectures that are offered and to the illustrations and demonstrations that are given. The course of instruction covers the practical phases of farm management, animal husbandry, and dairying, and the numerous problems that interest as well as perplex the housewife. These schools move from village to village during the winter season, and are growing more popular every year.

11. The Agricultural College Package Library, consisting of collections of pamphlets, bulletins, booklets, clippings, etc., each package bear-

ing upon some special agricultural, economic, or social question and of particular interest to rural communities offers free service to the citizens and school children of the state. These packages are in growing demand by those studying such subjects as the country church, the consolidated rural school, how to beautify the country home, the manly art of self-support, etc.

12. A regular system of farmers' institutes and extension lectures is maintained at state expense, the former directed by a superintendent and corps of lecturers under a state board of control, while the latter is directed by the extension department of the Agricultural College.

The rural life problem is freely discussed at all farmers' gatherings and suggestions offered for its improvement.

13. I wish to add in conclusion, just to indicate the trend of sentiment in North Dakota, and the enterprise developing in favor of rural improvement, that the Northern Pacific Railway Company and the Agricultural College jointly fitted up a train of twelve coaches, under the direction of the superintendent of the Farmers' Institute. This train, which completed its work just two weeks ago, was the most unique and elaborate of its kind that has ever been attempted in the United States or perhaps in the world. The train carried five types of live stock; a model poultry house with chickens, incubators, brooders, nests, etc.; one carload of grain-cleaning and spraying machinery; one coach filled with every modern device for labor-saving and sanitation apparatus for the up-to-date home, exhibited in miniature, together with working models showing the advantage of hot-water and hot-air heating systems, the pressure tank, septic tank, gas and electric apparatus for lighting, cooking, etc.

Equally in detail were exhibits pertaining to veterinary and animal diseases together with scores of exhibits to illustrate the subject.

Fully as interesting and instructive were the exhibits of horticulture; of chemistry, with special reference to food adulteration, food values, patent medicines, etc.; agriculture in all its bearings; biology, with special reference to plant diseases, etc.; also engineering with special reference to farm and household machinery. In short, it was the Agricultural College on wheels for three weeks, with twenty-seven professors and instructors in attendance to explain the meaning and purpose of the exhibits as the more than sixty thousand people passed thru the train while on its journey thru the state.

Fully a dozen correspondents accompanied the Farmers' Institute Special to report the enthusiasm with which this train was received by the farmers and villagers wherever it went.

At all rural gatherings discussions are mutual. Questions are asked and answered. The farmer's problems are considered from his own viewpoint, those of his wife from her viewpoint, and the children's from theirs. The ultimate aim is to make the country home a convenient place to work, an attractive place to live, and to make rural business sufficiently profitable

and agreeable that rural vocations shall be sought after by ambitious young men and young women instead of preparing themselves to fill, as is too often the case, cheap places in overcrowded cities—and I believe we are succeeding.

To accomplish this end we recognize the importance of education directed specifically toward the improvement of rural life conditions—education that will dignify labor as well as make it more profitable; that will educate the family as well as the children; that will ultimately professionalize agriculture as it has professionalized law and medicine, and thus restore God's great textbook, Nature, to the love and admiration of his children.

C. THE HUMANITY OF HIGHWAYS

MRS. FRANK DE GARMO, DIRECTOR OF COUNTRY LIFE DEPARTMENT, NATIONAL CONGRESS OF MOTHERS, ST. LOUIS, MO., AND COLLABORATOR, OFFICE OF PUBLIC ROADS, WASHINGTON, D.C.,

The child is the one great care of society. It is not at the child's past, but its future, that men look.—Jacob Riis.

No work for childhood will produce its most desirable results, that of developing good citizens, physically, mentally and morally, unless the mother, with her mother-thought, and her mother-love, enter into daily and active co-operation with those who labor for childhood, in the home, school, church, or society.

Heretofore, teachers have assumed responsibilities of crushing weight by taking every need of the child into the school. The usual home and farm activities, personal hygiene, and play have been added to the already crowded curriculum. What the teachers have not undertaken to do, the factory and the church have agreed to perform. Motherhood is thus shorn of its human and divine attribute, of personally caring for the physical, mental, and spiritual needs of the children, as well as rendering efficient assistance toward their social and recreation development.

Parents demand a high standard of culture and education for the teachers. But the same requirements for study, development, and conference along these lines ought to be expected of mothers, before perfect co-operation and unity of purpose can obtain between home and school. Mothers and teachers united would wield by their combined efforts an influence that would be irresistible and of immeasurable power for good.

Parent-teacher co-operation is the significant movement of the age. But such study and wise co-operation is denied to more than half of the parents and teachers of the United States, by the despotism of "bad roads." Some of the human welfare characteristics of good roads are:

Better economic conditions and better homes.
Better schools and better health.
Better churches.
Better spiritual advantages.

BETTER ECONOMIC CONDITIONS

1. Good roads increase population and bad roads drive people out.

2. Good roads increase value of property, and shorten the haul to market by shortening the time.

3. Good roads reduce the cost of living, because all that we eat and drink and wear—our shelter, light, and heat—come primarily from the soil, from which the materials, raw or finished, must first be hauled over roads to stations and wharves for shipment, or to market for sale.

4. Good roads would save the farmer $215,000,000 annually, and the expenditure of this sum for the betterment of farms and homes, and the educational and religious training of the 37,000,000 children in our country, each year, for a period of twenty years, would give to every American citizen in 1930 an annual pension of $320, which, for the children and helpless adults, would be showing divine compassion, for it would succor even the undeserving poor.

The enumeration of the commercial value of good roads and the thriftlessness of bad ones could be carried on indefinitely; but the Mothers' Congress, while urging the motherhood of the nation rightly to exercise its queenly power to weave and embroider the fortune of the home by attending to the ordinary and constant duties of conserving its economic and civic conditions, does not appeal to this divinely human "foster-mother" organization, the powerful National Education Association, composed, as it is, of faithful and scholarly members, to aid in the improvement of American highways for the purpose of facilitating the movement of traffic, or for the joy of the swift-moving automobile.

A nation cannot last long as a monetary mob. It cannot become one of the world's leading powers, and concentrate its soul on pence.

A nation, to perpetuate itself thruout the ages, must give all its people literature, science, art, and the ability to enjoy nature thru the avenues of its homes and schools, until generations have homologated the cosmopolite humanity from foreign lands into a people with one language, one country, a national poem, and a national faith.

BETTER HOMES

Good roads turn golden gain into the coffers of the agriculturist. With this purchasing power, the rural home becomes spacious, sanitary, refined in decorations and in the selection of its art and literature. It welcomes to its hospitable doors the instructors of its children, both secular and religious, and it becomes the haven of play and wholesome friendships for all the youth of the community.

Good roads make possible active and frequent interchange of opinions between parents and teachers, which results in a cordial co-operative spirit between home and school. Mrs. Ella Flagg Young has said:

Observation of the spirit pervading parent-teacher organizations leads me to believe that in those organizations is the corner stone for that structure which will make the life of the child in the home and in the schools a unity, not a life divided between two neutral, if not hostile, camps.

Will not this great body of men and women who are building the educational foundations for our children unite with the mothers in this loving unity, with the home and school; doing team work in every public or private school, from the kindergarten to the Senior year of college education? This can be accomplished only thru the permanent improvement of streets and roads.

BETTER SCHOOLS

No longer are mothers content to keep the children at home because of bad roads. They have formulated plans of service and co-operation that will keep the children in school because of good roads. Impassable roads, unbridged streams, lack of recreative amusement, a dearth of sociability, or of an opportunity to enjoy it, toiling and moiling from dawn till late at night, have combined to make dreary and unwholesome environments for the school children in many sections of our beloved country.

Good home environment means good school attendance, and studious pupils, and, consequently, good citizenship. The school reflects the homes of a community. The teacher who makes a remarkable change in the scholarship and ethical culture of the children of any school has had, heretofore, to perform a stupendous task—that of developing the homes along with the school. With improved roads and the prosperous homes will come the consolidated school, the Mecca to which all thinking men and women are now turning their attention. Without improved roads, that is, roads good for all time by proper maintenance, the consolidated or graded school of the rural districts is only a dream, a beautiful dream. Good roads will not only give the country the graded school, but they will create in that school, with its corps of teacher specialists, an opportunity for the country youth which will keep the boys and girls on the farm, and will aid in "lifting the veils of monotony and dreary routine from the shoulders of the 'worked-out' boy of the farm and his sunbonnetted sister."

The country graded school will stimulate the neighborhood activities, and competition will result. This will enable the boys and girls, on account of modern rural-school methods, by their own efforts to bring the best of life to their very doors. These school children will not desert the homesteads for city life, but rather, they will be instructed by capable and far-seeing educators to stay where there is room to grow, thus strengthening the "backbone" of the country.

In this school, there will be found special teachers in manual and domestic arts, and sciences, physical culture, agriculture, hygiene and sanitation; but among the first, if not the first subject taught in the

modern rural graded school will be the subject of *highways*. You smile at the thought of teaching roads. You teachers, who have never taught in a country or village school—can you imagine the agony that is a mother's when she has to awaken her little children and send them thru snow or storm, thru sleet or rain and mud, to a poorly heated, poorly lighted, poorly ventilated, and poorly taught, one-room country schoolhouse—there to shiver thru a day devoted, mostly, by the teacher, to discipline?

The theory and practice of road-building and its benefits have been handed down from generation to generation in most European countries. From their youth up, the men who were responsible for the building and maintenance of their country's roads acquired the knowledge and the spirit that enabled them to carry on the work of their forefathers. We, too, must inaugurate some system that will provide for the boys (and, since before long girls will be women and road overseers and commissioners in some of our states, we must not eliminate them), who will in future years for the most part be responsible for the humanity or inhumanity of the public roads of our nation. The chairman of the Country Life Department of the National Mothers' Congress, acting from this belief, has prepared a simple textbook, the *Ravenel Road Primer*, containing chapters easily intelligible to country school children, during this character-building period of youth, on the value of road improvement for better transportation facilities; also the elementary practices and principles of road construction, and the principle "that the public roads ought to be built by all the people, for all the people." These children will take all this to their homes just as they do their history lessons, and out of the mouths of babes and sucklings will come the strongest influence for the humanity of highways that we can bring to bear. While this educational campaign should be general in our schools, yet perhaps greater stress should be applied to introduce this system in our country schools, working in perfect harmony with the educational associations and all other organizations that are intensely conscious of the "human" value of good roads.

We should ask the highway engineers, and others understanding the theory and construction of roads, to assist the teachers; thus bringing together the two great forces of civilization, the school-teacher and the highway engineer. The youth should be imbued with the idea that good roads are the crying need of our country, and that they must rally to that cry with the same loyalty and oneness of spirit that they would leap to defend their country's flag.

If this elementary instruction were put into all of the schools, immediately the problem of better schools would be solved; intelligent voters will be made; there will be no politics in the "good roads" movement, which has heretofore clogged the wheels of its progress, and country graded schools will be the rule in all the states. City teachers will welcome an exchange of service from city to country schools, where, by this system of

reciprocity, they can rejoice in renewed enthusiasm and good health, the stars over their heads, and the daisies under their feet.

BETTER HEALTH

The statistics already collected are decisive as to the appalling death-rate, often by slow stages, caused by the impassable condition of the country roads. Wet feet and cold schoolhouses are responsible for the increase of tuberculosis in rural communities. The modern style of scanty dressing for girls has penetrated the country schools and the country girls and boys are quick to imitate the style of dress the teacher has brought to the community from his or her "finishing college" in a city with good sidewalks. Insanity, because of loneliness and isolation, owing to the forced imprisonment of women by bad roads; infant mortality, because the doctor came too late; and many other diseases of mind and body are traceable to the unimproved road.

BETTER CHURCHES AND BETTER SPIRITUAL ADVANTAGES

"Life forever keeps the keynote first struck." If so, it is but adding the emphasis of time to that of eternity as to the importance of early impressions. They dominate life, and perhaps govern thru eternity. If the child is to grow into manhood, with strength and beauty of character, he must have an opportunity to attend church as well as school. He must spend time in the cultivation of those higher and nobler elements that make up our humanity. There are three factors necessary to create for him an atmosphere of noble inspiration: the home, the school, the church; but only one of these is attainable in a community of impassable roads. When bad roads prevail, the home is the only source from which he must obtain this potent quality that makes for righteousness, and but few homes are equal to the task of pointing out the grandeur of human life when touched by the hand of God, or of making for the country child high ideals upon which his soul may feed. Without frequent interchange of thought and service, made possible only by permanent transportation facilities, how is he to learn the Fatherhood of God, and the brotherhood of man? Childhood is so ready to respond to that which is high that it is an appalling fact to note the lack of training and soul culture caused by lack of good roads. We are sacrificing our children, the best asset of the nation, to commercialism. We are wasting their rightful heritage of health, education, and spiritual development by spending only a pittance of the funds of the state or nation on permanent highways.

How can children stand erect, and look up to more inviting things on a higher plane, when their little feet are compelled to wade thru a long line of liquid morass, called a road, to go to church or school! If the country school is to be supplied with better teachers, and better libraries and other necessary facilities, it must have a greater number of children

and greater wealth to support it; and this can be had only in a community where the roads are in good condition during the winter months so that the children can be transported quickly, cheaply, and safely a greater distance. The solution, then, of the improvement of country child life is to secure, by judicious means, good public roads. There is no other way to solve these problems.

The taxes for school purposes are levied with the intention of securing, to every child, equal educational opportunities. But how few country children are permitted to reap the full benefits from the expenditure of the school funds on account of the conditions arising from bad, soggy, and impassable roads. And teaching of the best approved modern school curriculum is impossible. Such subjects as elementary principles of road-building, scientific farming, household economics, nature-study, athletic sports, and spiritual truths, which necessitate frequent associations of neighboring children, would tend to produce a high type of intelligence and faith, such as would give them a nearer communion with the forces of creation, and shed around them a moral beauty which would develop good citizens thruout the country. How many country children, with their limited education, could find

tongues in trees, books in the running brooks, sermons in stones, and good in everything!

The present "gospel of good roads" movement by the mothers of our nation, as a means of uplifting country life, should receive the hearty indorsement of the National Education Association, as this organization can have no nobler purpose then the betterment of American childhood, by united effort with the natural guardians of children, their mothers. True mother-love is proud, and yet unselfish. Noble mother-love and mother-thought would give, also, to the barefoot boy and his sunbonnetted sister of the farm palatial school buildings; Alhambra-like libraries, massive edifices, whose Gothic architecture resembles a "frozen prayer"; parks and playgrounds; amusement centers, where toiling and moiling of the long day are forgotten in the enjoyment of innocent pleasures. Sympathetic mother-love and mother-thought would give the doctor good roads, so that the lives of many more country children might be saved, and sickness and suffering speedily relieved.

To be good and do good is human. So are the opposite characteristics. Then who will deny that good or bad roads exercise human powers?

There is nothing which hurts the people more, or costs the people more, or keeps them back more, than bad roads; they make it hard to leave home, hard to get back, hard to haul, hard to visit, hard to get to heaven—sometimes. There is nothing that a man can think of that will do more to help the people than good roads, which make it easy to travel, easy to bring goods home, easy to haul your produce and manufactures to market, easy to go to school and church, and easy to avoid many bitter thoughts that bad roads cause.

What means this reaching-out of women to the lonely mother and child of the fields and hills? It is the spirit of God moving upon the deeps of

woman's soul, arousing her from her long lethargy, and impelling her to aid in continued and higher evolution of the human race. Oh, grand work! To aid in a movement for a higher rural community, and to open wide the gate of opportunity to the "worked-out" boy of the farm and his little sister, so that the farm will continue to give to our nation,

> Men to match her mountains, men to match her plains,
> Men with empires of brotherhood and mother-love in their brains.

In conclusion, may I be permitted to quote the following beautiful lines as equally valuable to mothers, fathers, teachers, and the "good roads" sentiment:

> "What doest thou," I asked a budding flower,
> "To sweeten life?" It nodded from its bower,
> "I'm growing!"
> "And what doest thou," I asked a child who quaffed
> The cup of joy,
> "To help the world?" He laughed,
> "I'm growing!"
> A laden apple tree, old, gnarled, and sore,
> Bent down and rustled softly in my ear,
> "Keep growing!"
> An aged man, with child upon his knee,
> Echoed again the wisdom of the tree,
> "Keep growing!"
> "What shall I do," I asked an angel bright,
> "When age draws nigh?" Then smiled he, from his height,
> "Keep growing!"
> Reach out to pastures now, where the soul feeds;
> Reach out and up—God knows the spirit's needs—
> "Keep growing!"

D. THE SCHOOL, THE COLLEGE, AND THE ENGLISH FARMER

E. J. RUSSELL, DIRECTOR OF THE ROTHAMSTED EXPERIMENTAL STATION, HARPENDEN, ENGLAND

Two well-defined tendencies can be traced at work in English country life: (1) a tendency on the part of the less educated or laboring classes to crowd into the towns; (2) a tendency on the part of the more educated and professional and commercial classes to leave the town and come into the country. The laborers go because wages are and must always be higher in town than in country, because there is more amusement, and more ways of filling up the interval between worktime and bedtime.

The professional and commercial classes come into the country because they like the quiet healthy surroundings after the noise of the city, they have learned to appreciate the beauties of Nature, or at any rate they feel it is the correct thing to affect an appreciation of the beauties of Nature, and, above all, they genuinely love a garden.

We have got, therefore, a process of changing over, the manual laborers moving cityward and the professional classes moving toward the country.

No system of society can be stable, however, unless it keeps a big population on the land, and it has become a serious problem for our politicians and educationalists to try and induce our working men to stay in the country and counteract their tendency to move into the city.

Hence our system of education has a threefold aspect: (1) It aims at giving the children of the laborers and small farmers an interest in country life so they will elect to stay in the country just as do the better educated classes. (2) It gives such instruction as will increase their wage-earning capacity if they do stay in the country. (3) It develops their intelligence so that they can do well in the city if circumstances should call them in that direction.

It is absolutely essential that the interest should come first in a democratic country. Every boy must be left free to make his own choice, even tho his elders feel that he is not acting wisely. And so, if the child is to be persuaded to make his life in the country, it can be done only by implanting in him from his earliest days a deep abiding love of country life. This is not very difficult, but the problem is complicated by the fact that wages in the city are much higher than in the country, prospects of promotion are more numerous, and advancement is more rapid. I have often seen the look of envy on the faces of our village boys as they stood round one of their number who has returned on a short holiday from his post in the city, wearing smart city clothes, and affecting the city business air, telling of the high wages he is already getting and the still greater things that are in store for him. If the teacher is really to keep the child on the land, he has before him the very difficult task (which he may perhaps only half-heartedly undertake) of convincing the child that twenty shillings in the country is equal to forty shillings in the city. This introduces another aspect of the question and shows that our educational system must lessen the disparity between the wage-earning power of the country man and that of the city man. During the period when our elementary education system was evolved, we had a number of years of severe agricultural depression. This reacted on our educational methods, and the object, or at least the result, was to train the boy to be a clerk in the city, but not to be a worker in the country. The teaching was didactic, it furnished the boy with useful facts and a facility for manipulating words and figures, but it did not help him in dealing with things; in consequence, such a boy did fairly well in the city, but very indifferently in the country; when he left school he knew nothing that was any use and he had never acquired habits of observation or thought.

The result was that education became highly unpopular among our farmers. They had to bear much of the cost of it, for education is largely paid for by a rate levied in the district, altho, of course, the state makes a

contribution, and they had the mortification of finding that the young men who had been thru the school were not only no better than their fathers, but were not even as good. Even today our keenest observers are probably our old shepherds and ploughmen, while very few of our young men are equal to their fathers or their grandfathers in manual dexterity and ability to perform such country arts as hedging, ditching, thatching, etc. So unpopular, in fact, did rural schools become that it was realized that a change must be made in the system: if the child was to be kept at school at a time when he was most receptive, he ought to have at least as good a training as the child who was brought up by his father on the farm. Educationalists also began to realize that it was unsound to make the children purely passive receivers while the teacher was the only active instrument. And finally, a few reformers pointed out what a loss it was for children to sit in a classroom poring over artificial books that were out of date almost as soon as they were written, while the great book of Nature lay open outside, ever fresh and true and never out of date.

The great change came about thru the remarkable extension of gardening that has taken place in England of recent years. This fact is attested by all observers, and is revealed also by the great florist and seedman's trade that has now sprung up, and in the demand for a new type of house with a garden laid round it, and in the rapid development of our garden cities. Provision was early made by which laborers and workingmen could obtain plots of land—allotments—on payment of a low rent—$2.00 or $3.00 a year for a large patch—on which to grow their vegetables and flowers. Presently the schools began to get their gardens, and when the state made a special contribution of four shillings per annum for each child toward the cost of the garden, the idea began to spread, and now the school garden is fast becoming a very popular institution.

Having now introduced the school garden, the next thing was to make it the center round which the education should develop. This was not quite a straightforward task because it was essential that the garden should succeed as a garden. The trouble is that our laborers and allotment-holders—especially the older men —are very good gardeners themselves, and are extremely critical when other people set up a garden. So long as the teacher keeps to books, the laborers have no way of measuring him up, but directly he takes to gardening, he embarks on a business with which all the workingmen of the village are familiar, and in which they will be competent and ready to criticize all his efforts. If the garden succeeds, the teacher wins the respect of the villagers; if it fails, the respect is qualified and the verdict of the village is that he may be a clever man, but he is no gardener. Forthwith the school garden loses its hold on the parents and children. Now every teacher knows how difficult his task becomes when the parents scoff at his apparatus, and when you further remember that our teachers are subject to a certain amount of local control as well as to the

local public opinion, you will see how necessary it is that they should not incur the unfavorable criticism of the village gardeners.

In trying to make the garden the center for the educational work of the school, the teacher has had this wholly extraneous condition imposed upon him by public opinion—the necessity for making his garden satisfy the gardening critic. This has reacted in two ways. It makes the children very keen indeed. They want the garden to look well and to be as good as any in the village. But there is also the temptation for the teacher to do too much of the work himself—this is not good. But the great disadvantage is the tendency for the garden to become a place for growing good vegetables rather than a place for educating the children—it becomes a market garden instead of an educational laboratory.

It is of course possible to reconcile these ends, but to do so requires a good deal more from the teacher than if he had only one object before him. In many cases the teacher has not been trained to do the work; he has been brought up to consult books rather than to handle things, to believe the printed page rather than the evidence of the senses. He has been in the habit of regarding the child as a recipient of knowledge—not always a very willing or a very passive recipient perhaps—and he is not prepared to change his view at once and let the child become an active seeker after knowledge. Fortunately our teachers are a very fine body of men and women, pervaded with the true professional spirit, and once they see the advantage of a new method, they take it up enthusiastically. And the chief reason for the success of the school garden has been that it has the whole-hearted support of the teacher.

There are two general methods of utilizing the school garden. The teaching may be wholly didactic—the child being told what to do and what will happen—or it may be wholly experimental—the child setting out to discover truth for himself. The second method is admirable in principle, but very difficult in practice. Those of us who spend our days experimenting know how extremely difficult it is to ascertain even the simplest fact with which we were not previously acquainted. In walking one day with my little boy, we picked up a fir cone and he asked me what it was. Being a believer in the experimental system, I got him to plant it in his garden to see what would happen. In due time up came a potato, and he drew the perfectly legitimate conclusion (according to the experiment) that fir cones gave rise to potatoes. Prima facie the experiment was good, in reality it was bad.

I know of no more difficult exercise even for the trained scientist than to devise an experiment that shall give a perfectly definite answer to a simple question. So often some complicating factor intervenes: the experiment doesn't turn out as was expected and the teacher has to explain the result—sometimes to explain it away. Now this is one of the worst of bad mental habits.

Probably the most satisfactory course is a judicious combination of the experimental and didactic methods. As the teaching has to be strictly in relation to the child's environment, it is necessary to make full use of local material. But as the teacher is preoccupied in his so many other tasks, it would be unreasonable to expect him to make out a course for himself without guidance. We are therefore adopting three methods: (1) Our Cambridge University Press is publishing a series of nature-study readers, each on a single definite aspect of nature, written by experts and containing simple experiments and notes for observations. (2) Our agricultural colleges are arranging summer courses for teachers, dealing with the natural history of the locality. (3) Young teachers still at college may have a third year's course on nature-study. This last is not very popular. But the summer courses are, and they are doing much to make our school gardens the center of the educational work of the school.

In an English village, as I hope I have made it clear, a teacher has by no means a simple task. If he succeeds, he is not unfrequently tempted away to the town by a higher salary and by better chances of promotion. Indeed the operation of economic forces would tend to draw the best men and women away from the country schools, and leave them to be staffed on the principle of the survival of the unfittest, but fortunately economic forces do not entirely dominate the situation. It ought to be recognized everywhere, however, that the country teacher may serve the community just as well as the town teacher, and deserves just as great a chance of promotion and as good an opportunity of making the best of his life. If this is not done, the teacher may not accept country life permanently unless he is obliged to do so. The essence of the newer methods of teaching is to draw out the best that is in the child and make the best of the faculties it possesses. This can be done only by a teacher who is himself a person of distinction and individuality, and the community must be prepared to offer adequate inducements for such persons to enter the profession. Perhaps I ought to apologize for mentioning financial matters at a gathering of distinguished educationalists, but I remember I am in Chicago, where such matters may permissibly be mentioned. What I want to say is this: we often notice a great willingness to spend money on buildings, on apparatus, and on schemes. But I venture to think this is the wrong end. No building or scheme will be of any use unless the right man or the right woman works it. Let us but have a good teacher, and all the rest follows as the day follows the night. Let the authorities attract good men and good women into the profession; give them a free hand and a generous remuneration; and I believe the problem of school education in country districts will be solved. Such a teacher will make a study of the children, their parents, and their surroundings, and will soon know just what common objects of the country will best serve the purposes of education. A teacher in full sympathy with country life will need no

scheme; he will select his material from whatever interests him or his scholars most. It is a significant fact that our best results are obtained where the largest measure of liberty is allowed to the teachers.

I have dwelt at great length on the elementary school, because experience shows that here the problem is most important. If only the elementary teaching has been right the higher grades present no serious difficulty.

After the elementary school days are passed, the boys become sorted into two classes: those who must go to work, and those who are either clever enough or sufficiently well off to go to college. The latter need not now concern us, they are numerically in a minority and our facilities do not present any special or novel features. The boy who has to leave to go to work presents a more serious problem. For physiological reasons, it is necessary that a boy should have abundance of physical exercise during the important period between the ages of thirteen and seventeen. He can get this on a farm. He can also train his powers of observation and acquire a newer and broader outlook on life. There would seem to be no valid reason against his leaving school early if provision is made for his further education. This must be on strictly scientific lines, i.e., the boy must be trained to observe and to think and to feel his place as a member of a community with great responsibilities. But while our aims must be high, we must not lose our bearings; we must remember that a boy is essentially utilitarian in his outlook and he has to earn his living. In providing the mental training, the teacher must therefore use the common knowledge and experience of the best type of countryman and must draw on the new knowledge that is being gathered at the various experimental stations. Naturally the teacher cannot do this without guidance, and here again our Cambridge University Press has come to the teachers' aid. This subsequent education is sometimes arranged at night schools and sometimes at winter schools; the latter is so much the better arrangement that provision is now being made for considerable extension.

When the young man is taking a large part in the direction of the farm, it becomes necessary to give him a much more frankly agricultural instruction. This is being done by itinerant instructors, by market-day lectures, by short courses at the colleges on special subjects, by inspection of the farms and allotments, and by demonstration plots. The success or failure of these various schemes is profoundly affected by the attitude of the village teacher; a keen, energetic teacher who has got a hold on the village community is the best agent the special lecturer or instructor can have in our country. Only the best types of men, however, are of any use for this kind of instruction: our farming is very highly specialized and our farmers are extremely capable, the poor ones being speedily crowded out. Again, therefore, the problem reduces itself to finding good men and women, people with sufficient intelligence to see what is wanted, sufficient personality

to get their views accepted, and sufficient energy to get their program carried out. So long as such people are forthcoming, the rural problem need present no insuperable difficulty.

THE BEST NEXT THING FOR THE TEACHING PROFESSION

ALBERT E. WINSHIP, EDITOR OF "JOURNAL OF EDUCATION," BOSTON, MASS.

It would be easy to name many good next things professionally, to name the best next things in devices, in methods, in discipline, in equipment, in administration, and in philosophy; that is, the best from one man's point of view. None of these is the most vital. They may be important, but they are not dominant.

Isn't it time that the National Education Association grapples with the biggest issues, with those that are at the same time the most extensive and intensive? No one ever hits a target who does not aim above it, and the farther away it is the higher above it one must aim. Why should not this meeting of the National Education Association in its closing moments here highly resolve that education shall become the leading American profession?

New times demand new men and new measures. The new times are surely here. The profession that meets the demand of these times will be the leading American profession. Education can meet these demands better than law, medicine, or the ministry. It is more likely to meet them.

Law, once the most eminent of the professions, will not meet the demand of the new times with a mission and message for the ennoblement of humanity, unless it ceases to win its greatest triumphs in finding legal trapdoors thru which the guilty can escape justice.

Medicine is not likely to meet the new demand until it ceases to think it more professional to kill a patient regularly than to have him restored to health irregularly. Health, not regularity, must be the professional aim.

The coast is clear. Education can be the leading profession of the century. Education is the only profession that can devote itself exclusively to the making of manly men and womanly women. Education is the only profession that can lead the present generation to virtue, integrity, and nobility thru the influence of childhood. In the long ago it was said, "A little child shall lead" us into the millenium, and education can compass that highest of achievements.

Education was the first profession; why may it not be the greatest? It is the only learned profession whose leaders in scholarship have been called professors; and the one man who met all the needs of the times, the greatest of all men, was the Great Teacher, the founder of the profession of education. But if education is to be the leading American profession, the profession of the century, there must be from the bottom to the top a complete transformation. If the teacher is to lead the preacher, the physician, and the lawyer in the professional race, there must be a transfiguration.

In three respects, from the lowest to the highest, there must be a new birth. We must think in larger units than they; we must be more dominant and less domineering; we must rise above self-consciousness and class-consciousness, and be more subconsciously dominant than they.

We shall be measured by the size of the units with which we measure. A pencil may be measured in inches, a door in feet, a room in yards, a field in rods, but distances must be measured in miles or furlongs. He who would give the dimensions of a field in inches needs no other judgment as to his size. The teachers must cease to measure a boy by any one act, even for the moment, by the mechanics of spelling, by the facts of the text.

Some of us can remember when it was an educational crime not to do well everything assigned in school, and more of a crime to do anything, however well, that was not assigned in school. A million boys have been thrashed for not knowing things not worth knowing, and another million for doing something well worth doing. All this must go—must go completely—and we must measure things, in school and out, by units large enough to see the whole boy and his whole life. We must see him as he is and as he is to be.

If education is to be the profession of the century, it must be dominant and not domineering. This will indeed be a great transformation, a transfiguration.

The law of dominance, as discovered by Mendell fifty years ago and rediscovered and magnified by De Vries fifteen years ago, is as true in the intellectual and moral world as in the physical. If from two well-established families of guinea-pigs, one rough-coated and one smooth, you mate one from each, the four offspring will be rough-coated. That is dominant. But if you mate two of these rough-coated offspring, three will be rough-coated and one smooth. The recessive quality in the second generation is one-fourth the dominant, but thereafter it will appear so rarely that it will soon disappear entirely.

No one, not even the parent as a rule, has such an opportunity to dominate a child's life as the teacher. The great mission of the school is to dominate the child's thought, motive, and spirit. A graduate of a university recently said:

> One professor in one semester did more for me than all the others combined. Under him I found myself. I can think with a purpose and have a motive in life.

Unfortunately the tendency has been to domineer rather than dominate. The ideal of obedience, of regulating the knowledge and the thinking of every child by the teacher's predilection and the professional traditions, has led too often to a domineering spirit. Dominance is good, domineering is bad. Dominance is a divine attribute, domineering is the characteristic of his Satanic majesty.

In one town of less than one thousand inhabitants in western New York

was a hotel proprietor who was the master-mind of the village. He dominated the youth of the place in an effective and wholesome way. Today six of the best hotels west of the Mississippi River, as good hotels as there are in America, are managed by boys of that little settlement. So far as is known only one other boy attained even moderate prominence because of the dominance of teachers or preacher, of lawyer or physician.

A few years ago a serving woman in West Chester, Pa., died, and at her funeral were five eminent men—brothers—one from the Harvard faculty, one from a theological seminary faculty, one from an eminent pulpit, one from fame in medicine, one with the wealth of a banker. One of them conducted the service, two others took part therein. It was the most distinguished funeral service ever held in that city. They said that faithful family servant had dominated their boyhood life so wholesomely that they could but turn aside from their honors and opportunities of life to pay this tribute to a worthy humble woman.

Think of the opportunities that come to a half-million teachers every year! Education must dominate if it is to be a noble profession, and it is an entirely easy matter if rightly approached.

Finally, our units of thought and our dominance must rise above self-consciousness and class-consciousness and must react upon the subconsciousness of individuals and communities, of industry and commerce, of civic and religious life. This will be exceedingly difficult of achievement. The relation of the teacher to the pupils on the one hand, and to supervisors, school boards, and the public on the other, makes self-consciousness almost inevitable. Teachers have suffered so long from injustice that there seems to be no way to right the wrongs except thru class-consciousness. The superintendents, the kindergartners, the music teachers, the drawing teachers, the normal training teachers, the sewing teachers, the cooking teachers, the physical training teachers, the teachers of Latin, of German, of French, and of mathematics, and now the grade teachers, the women teachers, and the men teachers are all flocking by themselves, hoping to gain something or retain something by the development of class-consciousness, but there will be no achievement until everybody is more a teacher of boys and girls than of any pet subject. Some men have been scared into an effort to set the boys off by themselves in the hope that they can develop a male class-consciousness that will make it impossible for a female camel to get her nose into that tent.

What all teachers need, what must be, if education is to come to the head instead of staying at the foot of the profession, is a uniform and universal effort to dominate the subconsciousness of everybody. There is a subconscious purpose to provide good school buildings in cities. It is no longer necessary to campaign for new school buildings. There is coming to be a subconscious right attitude toward salaries, tenure, and pensions in progressive cities.

Let the good work go nobly forward among ourselves and with the public until all teachers think in large units, until education dominates the subconscious life of pupils and the public, then education will be the greatest of professions.

PEACE AND ARBITRATION

BARONESS BERTHA VON SUTTNER, VIENNA, AUSTRIA

I should like to ask the question whether education is merely or especially a matter of schools and universities and has to deal only with childhood and youth. It seems to me that education must be continuous and that the greatest educators are life and experience. Every grown man or woman who wishes to deal with one of the great problems of the time must practically and unceasingly educate himself or herself in order to grasp its multifarious aspects. And since every progress consists in the victory of a new thought over old prejudices, it cannot be thru the knowledge of past facts and data, laid down by former generations into textbooks, that the new ethical and political and social systems can vanquish the old ones.

But there is one thing that in modern times can be taught and is being taught to our young, namely, that the world is moving onward and upward; and that therefore the student mind must be prepared to open to the new lights which are continually breaking forth from life and science. This domain is the future and it has hitherto been a great error of educational systems to nurture a sort of idolatry for the past, as if all wisdom, all heroism, all religion had attained perfection in the foregone centuries. I do not speak of America, which is young itself and which forecasts all its ideals into the future. I speak of the educational systems in my country which breed the adoration of the past, the conservation of the present, and the dread of everything that is new.

You know that the subject of my discourse is universal peace and that certainly is a question of the coming times, for the old war system is still in force in our days, in spite of the fact that the ideals of peace have already been introduced into practice by existing institutions. I mean the Hague conferences, the arbitration treaties, etc. On this field appears most conspicuously the difference between the spirit that reigns in your American educational practice and the spirit prevailing in the schools of middle Europe.

With great gratification I see that in your programs the peace movement with its history, its principles, and its aims has been given a broad place, that contests and prizes on the subject are introduced into the schoolplay and that Peace Day is celebrated in the schools and cosmopolitan clubs founded in the universities.

In our country it would be out of the question; no such thing exists.

There, the instruction of youth is entirely based on the military régime. The widest space in history is given to the description of battles and the glorification of warriors; the whole system tends to the training of obedient servants to the throne, the altar, and the army—a narrow-minded patriotism consisting of pride in the armed world-power of one's own nation, and the contempt of other nations, and unquestioning readiness to fight at the first sign of the war-lord and to sacrifice any sums for the demands of the war department. Such is the highest virtue which the official school methods tend to implant in the mind of the growing generation.

Lately rifle shooting has been introduced in our schools. The Austrian minister of public instruction visited a college to assist in the shooting exercises of the boys and pathetically expressed his satisfaction thus:

> I am very glad to see that in spite of the protestations of some mothers and some masters, the healthy and useful branch of rifle shooting has been introduced into the school plan: but do not think, my boys, that this merely means healthy exercise or the acquisition of dexterity. You must look higher, you must elevate your thoughts to the ideal aim of which you never must lose sight, the aim to defend your fatherland at the call of our most high sovereign to whom you must ever be ready to sacrifice your goods and your blood.

If one approaches such a high functionary with the proposal to prepare youth for the new order of things which, thru the Hague Tribunal, the arbitration treaties, and the common demands of democracy shall be able to avert the dangers of war, then they will answer you:

> In our seriously conducted institutions there is no room for such dreams. Nay, we consider it as dangerous to the necessary military spirit and patriotic feelings that such Utopian matters should be mentioned in the schools.

Now see the difference: last year your Secretary of the Interior issued a circular recommending that all the teachers of the state should be supplied with programs for the celebration of May 18, Peace Day, and in this edict the statesman said:

> Whatever we want to have in the nation for tomorrow, we must put into the schools of today, these workshops of humanity. Among the many movements of modern times for the advancement of civilization and the relief of humanity from unnecessary burdens of expenditure and paralyzing fear, none is more significant than that for arbitration and world-wide peace.

So here, the fundamental principles of peace are fully recognized as that which is wanted in the nation of tomorrow, and I deeply rejoice to find it so. It corroborates my confident hope that these feelings and these methods of the New World will spread and conquer the ancient traditions and stagnant spirit of the Old World. Do not reproach me for lacking in patriotism in bringing before you accusations of my own country. It is love for my country and for humanity which spurs me to confide to you my bitter grief and to tell you the wretched truth. You must know how things stand in middle Europe and then you will be more eager to help us with your example and with your acts. You must send

peace emissaries across the sea from your universities to ours; you must try to missionize our youth and our teachers. If you could but realize it, this is necessary to you in self-defense. The interrelation of the nations is now so close that the progress which is attained in one country must modify the others or nothing is permanently gained.

The danger of expansion of the war spirit in Europe is so intense at the present hour that if it is not counteracted a general conflagration of the whole mass may be expected and would retard even your civilization.

In all the civic and social complications with which you are wrestling in this country, you are handicapped by mid-European problems and vices. The educational body today is forced to confront most of the social and economic questions.

The child without the breakfast is the doorway into a vista of social wrongs. We may procure his breakfast for him—but we hesitate to open the doors even for a glimpse. In our informed imagination we catch the swift picture of the sweatshop, the impossible tenement, with its child laborers of delinquents, starvelings, degenerates, tuberculosis, helpless motherhood, the shop girl, the white slave, and so on *ad infinitum*. Without discussing the remedies, let me ask what is the cause, the farthest-lying cause? In Europe mother and child have for centuries labored while war and army demands father and son. Some of our oldest architecture proves that the sunless tenement has long been occupied by the impossible poor; also it was a sort of communal defense in time of attack. The white slave and the illegitimate are a war-evil in a military nation.

In a nutshell: these problems have been the creation of militarism and sent to you full-fledged by the shipload, and in your country with a federal government spending 70 per cent of its income for war measures you are not financially competent to cope with these important problems. Your purse strings are pulled by the armament trust first and not by the educator and conservationist.

I give these suggestions knowing after all that your educator, in the last analysis, is the agency which shall solve these complications, as he teaches history, social science, physiology, and the rest.

And now to return to the narrower confines of my theme, peace and its relationship to the teaching of the young, I should say:

Teach them the high faith in the right.

Teach them to stand by this faith when they vote some day.

Teach them that your federation does not stand alone for justice to each other, but for justice to every other.

Teach them the ideal of the brotherhood of the world from ocean to ocean, thru the great canals, across the Pacific Isles, into the heart of the colored races. Teach it as a standard and example to every other power. Teach them that the ideal of their nation is not to give history another

"world-power" to overshadow the rest, but to be a nation brave enough to unfold universal brotherhood, the final religion, to all the rest.

Teach them the courage to refuse to be conquerors.

Teach them good will to every race and tongue.

Teach them to aim to keep their nation as the leader for movements for righteousness and peace among men.

Teach them that pure patriotism means world-welfare.

Teach them that the greatest protection to their nation is in its moral courage.

Teach them that good will is a stronger protection than armies and navies.

Give them the vision of a united congress of all states, working for a new international federation, and international ethical co-operation.

Teach your youth that they are the real Peace League of the present and of the future; that upon them as an army, not of scouts, but of lovers, the future ideal of this race and all races depends.

Teach them to be interpatriotic, international, interracial.

And while you teach these all-consuming ideals to your boys and girls, you must watch that you do not co-operate with the enemy without knowing it.

Oppose all legislation which appropriates your money for armaments instead of development.

Oppose the fortifying of your great seaports and your canal which are destined to be the bridge between the races.

Oppose all plans to put rifles into your schools.

Awake from the illusion that the Boy Scouts movement is for manly development and character. It was designed by great war captains as the forerunner of conscription to make it easy for your boys to be forced into the army.

Question closely your military schools and your Red Cross movement.

Know that the gun merchants are lobbying to sell their wares for sheer profit and are always busy in working up scares to rush thru the appropriations they covet.

And now in closing, let me say to my fellow-workers this:

The explorations of the astronomer have already given us the hope of the interworld relationships—relationships which we can never hope to enjoy save thru our science-illuminated vision.

But we know that the same law of harmony which controls the cosmos also controls our social progress. We must unfold for our local star, this sphere, the glory and the realization of the interpax ideal for every atom of humanity.

CAMP FIRE GIRLS

GERDA SEBBELOV, GENERAL SECRETARY OF THE CAMP FIRE GIRLS, NEW YORK, N.Y.

The most decided intellectual progress often comes after long deliberation in close contact with nature. Sitting alone on a rugged mountain in the quiet of the night while running rivers, washing waves, and wild animals' steps form part of silence itself; out at sea with miles and miles of curious-shaped icebergs tinted by the midnight sun which rests like a large red balloon on the surface of the ocean; on long sleigh drives with a dog-team over ice fields and snow; or alone with a horse across the prairies—at such times life seems vaster, and strong resolutions come unbidden.

Men spend a good deal of time boating, hunting, riding—being alone with Nature. With girls it is different. In the Western High School in Washington, last year, two hundred and seventy-four dollars were solicited by the girls and boys to be used for out-of-door sports. There are more girls than boys in the Western High School and always the girls seem to be more successful in their efforts to secure funds. When the year was over, the principal looked into their accounts and found that two dollars out of two hundred and seventy-four had been used on the girls. A committee was then appointed whose duty it was to find ways and means of spending money on girls. Now, there are fifteen Camp Fires in the Western High School and more to be formed. I have no doubt that other schools in the United States which want to spend money advantageously on their girls will find the Camp Fire movement a convenient aid.

Groups of Camp Fire Girls hold meetings every week at which they work together to achieve experience in such things as will make them intellectually, physically, and spiritually strong and independent. The monthly meeting is beautiful. At this the girls meet in ceremonial dresses, around an open fire, out of doors, if possible; receive recognition for whatever they have achieved, and learn to laugh together and enjoy. At all meetings, a woman over twenty-one years of age is leader and planner. She is called Guardian of the Fire, and has the privilege of giving her experiences of life to the girls and helping shape the elastic material of young souls.

When a girl wants to join a group of Camp Fire Girls, she must know and understand the Law of the Camp Fire. She comes before the fire at the monthly meeting and says:

It is my desire to become a Camp Fire Girl, and to obey the Law of the Camp Fire, which is

Seek beauty
Give service
Pursue knowledge
Be trustworthy
Hold on to health
Glorify work
Be happy

This Law of the Camp Fire I will strive to follow.

Then she is a Camp Fire Girl and will always stand for the ideals of the organization.

To attain the second degree of Fire-Maker, a girl must have fulfilled fourteen definite requirements including such demands as to prepare and serve two meals at the weekly meetings, to hem a dish towel, darn a pair of stockings, know the causes of infant mortality and to what extent it has been reduced in one American community, know what a girl of her age should know about herself, tie a square knot, sleep with open windows, and learn a poem of not less than twenty-five lines in length. She must also present twenty elective honors won from out the seven crafts suggested in the handbook: health craft, home craft, nature lore, camp craft, hand craft, business, and patriotism. She must have perfected herself in experiences that bring health and efficiency. Once again she comes to the fire at the monthly meeting and expresses her desire to bring out her individual attainment for the good of the community, saying:

As fuel is brought to the fire
So I purpose to bring
My strength
My ambition
My heart's desire
My joy
And my sorrow
To the fire
Of humankind
For I will tend
As my fathers have tended
And my father's fathers
Since time began
The fire that is called
The love of man for man
The love of man for God

To gain the third rank of Torch-Bearer, the girl must be a leader. She must have developed herself personally and desire to use her development for the good of many. She must actually show thru leadership that she is able to help others attain; and thru the attainment of others is she judged. It is not driving, it is leading that we demand of our Torch-Bearer. Individually she must be known to her Guardian as happy, unselfish, and a good leader, a good team-worker, and well liked by the girls. She shall present fifteen elective honors, one from each of the seven crafts. Once more she steps up to the Fire and expresses her desire to lead by saying:

That light which has been given to me,
I desire to pass undimmed to others.

Then she is a Torch-Bearer, a help to the Guardian, and herself a leader.

Camp Fire Girls dress reasonably, simply, and beautifully. To put upon the market such things as Camp Fire Girls would want to wear, the

Camp Fire Outfitting Company has come into existence. It furnishes the plain blouse with sleeve emblems of different ranks; a skirt, buttoned all the way down the front and back and with a large pocket (for "Camp Fire Girls have pockets"; they do not carry unnecessary, unessential things in their hands, but put them in their pockets and have their hands free for work in the world); practical bloomers for camping and hiking; a plain, beautiful hat; ceremonial Indian dress; and all the insignia of the different ranks: a pin, a bracelet, and a ring. The Torch-Bearer's pin is round and divided into four sections standing for the four seasons of the year. In the one is the rising sun, in a second, clouds and lightning, and in a third, the standing pine which is the individual symbol of the Camp Fire Girls, standing for simplicity and strength. The whole pin means that thruout the seasons, in sunshine and storm, the Camp Fire Girl is sturdy and strong, as the standing pine.

The Fire-Maker's bracelet is engraved with our watchword, "Wohelo." The Wood-Gatherer's ring—I mention this last because it is most important (it signifies membership in the organization)—is given to each girl as she joins. On it is a bundle of faggots, standing for the seven points of the Camp Fire Law. The faggots are part of the pine, the individual symbol. With the ring goes a little poem, teaching the significance of membership in one large body with one high ideal:

As faggots are brought from the forest
Firmly held by the sinews which bind them,
So cleave to these others, your sisters,
Whenever, wherever you find them.

Be strong as the faggots are sturdy;
Be true to your deepest desire;
Be true to the truth that is in you;
And—follow the Law of the Fire.

That means individual development for co-operation and team-work.

THE CAMP FIRE GIRLS AND THE NEW RELATION OF WOMEN TO THE WORLD

LUTHER HALSEY GULICK, DIRECTOR OF THE DEPARTMENT OF CHILD HYGIENE OF THE RUSSELL SAGE FOUNDATION, NEW YORK CITY, N.Y.

It is my place to sketch the conditions which have created a new relation of women to the world; to show why a nation-wide organization of girls and women is inevitable; and to indicate some of the main results to be secured by such organization.

WORK AND THE HOME

Most of the grandparents of those in this hall lived in homes which were largely sufficient to themselves. That is, the mothers knitted stockings,

wove the cloth for and made the clothing; cooked and served the food, churned the butter, made the bedding, did the washing, prepared for and served guests, cared for the sick, had many children, and—died young. In these homes the men tilled the ground, raised the corn and wheat used for daily bread, made most of their own tools, bred their own cattle and horses, raised their own mutton and wool, built their own houses, made the harness, dug the wells, cleared the fields, and on necessity, fought Indians and English.

SCHOOL

During the brief winter months the children learned such reading, writing, arithmetic, history, and geography as they could, but unless they were destined for law, medicine, or theology, their schooling bore but slight relation to their essential preparation for the great business of the world, namely, living. The boys and girls working in the house and on the field with their parents learned those trades and arts and industries which later on were to be their own chief occupation.

CHARACTER EFFECTS

Significant as was this learning to do by doing, the indirect results of the work were even more valuable than was that material welfare which was the direct object of their daily toil. This most precious indirect effect of daily work consisted of an attitude toward life and toward the world. Work itself became gradually evident as a chief means of attainment, love, and comradeship. The steadily broadening moral shoulders of the boy grew under the stimulus of the increasing load of responsibility which came to him year by year as he worked by his father's side—each helping each to the necessities of life, both physical and spiritual. In this way, responsibility, power, obligation, and love formed the basis of powerful, true character. This was the preparation for life that produced the men and women who in the main created this country.

PRESENT CONDITIONS

The conditions that our children meet today are fundamentally different from the conditions which faced our grandparents when they were children. Steadily, one after another of the occupations, trades, industries, and arts have been taken hold of by the community, organized, and placed upon a basis of effectiveness unimagined in the old days of home manufacture. The beauty of our clothes, the comfort of our dwellings, the variety and quality of our tools, the bewildering world of books, the space-devouring railway, the steel structure business house forty stories high, the great hotel, the bakeshops, specialized farms, schools, churches, theaters, clubs, political parties, universities, world-news, and travel, all proclaim that the humble attainments of the home were but first steps, and that larger and more varied groupings of human beings could attain ends undreamed of in

the olden days. It is not, as so many sadly declare, that the home is degenerating. The splendid truth is that infant activities born and raised in the home are now stepping out into the community. This is no more a cause for regret than is the bursting of the shell when hatching time has come, or spreading one's wings to the air when the time for flight has arrived. The world-experience given by the freedom and power of flying, the great adventure, far surpasses even the beauty, comfort, and safety of the nest.

MAN MADE MODERN CITY

This wonderful new social integration of the world became possible only when man had harnessed power and had invented machines. With power and machines he has done most of the things that most of the people of all the world have done during all the ages. He has thus increased the riches of the world more in one generation than had been accumulated in all time before. This, as I have already said, was done mainly by man and not by woman.

WOMAN'S WORLD CHANGED

The result has been fundamentally to alter the adjustment of woman to the world. In the olden days man, with his weapons, provided food, shelter, and safety. Woman made of them the home—she converted passion into love, domesticated beauty, invented industry, and was the mother of happiness.

Today man has again gone out, this time into the social world, and with his tools and harnessed world-power has again brought back food, shelter, and safety from the primitive dangers—food from the whole world in a new abundance and a surpassing variety, shelter such as was never dreamed of before—and has doubled the average span of life by lessening its dangers.

WOMAN'S NEW WORK

Man has made of his new world a wonderful, a magic place in which to work, in which to make physical attainment. He has not made of it, however, a good nor a beautiful place in which to live. He has made of the community a factory, not a home. In other words, he has not done for the community what woman did to the home.

The world-old power and skill and devotion of woman are again being called for and being given, but now not merely to make and preserve the individual home, but to give to the community those spiritual qualities which she gave to the home.

WOMAN FOLLOWS HER WORK

Woman's work has much of it been taken into the community and out of the individual home. Woman is, therefore, following her work into the community. She is taking on the same kind of responsibility in the community which she has always carried in the home. Many of the psychic

functions of motherhood she is discharging in the school. She is making playgrounds for children, healthier conditions in schools, fairer conditions for the work of men, women, and children in farm, store, factory, shop, and mine. The ideal is that of universal motherhood—all the women being responsible that every child is loved, cared for, and given a fair chance. She is beginning to see that she is responsible for much of the municipal housekeeping, the conditions in the bakeshops and grocery stores. She is concerned that food shall be pure and water clean.

WOMAN AND SOCIAL LIFE

As woman's deepest service in the home is social, so her deepest responsibility is for the relations between people in the community. It is not enough that evil shall be prevented, that every sort of traffic in human bodies and souls shall cease. Human relationships, social life, must come to be in the community so that the deepest desires and hopes and passions of human beings shall lead toward the development of that which is fine—toward life and not toward death. The relations between young people must be so arranged that all the power of sex and the passion of love and desire shall lead toward attainment and growth and beauty and power, and away from death and disease. To make goodness alluring and show the shallowness and stupidity of vice—to bring the qualities and spirit of the home into the community, to embody such ideals in the common habits, the daily life of a people, is such a task, such an opportunity, as has never before been given to the world. Thus are the age-long qualities of women needed in our new world to realize its surpassing possibilities as well as to save it from spiritual disaster.

SEX DIFFERENCES IN SOCIAL RESPONSIBILITY

We often hear these days of the conflict between men and women, of the competition for work on an economic basis, but this is, I believe, a lesser and not a larger fact. We are, of course, all human beings and as such most of our qualities and abilities correspond. We all eat and sleep, and work and play. But we are significant in the world mainly by the extent to which we, as individuals and as groups, differ from each other. My special place in the world is due to my differences, rather than to my likenesses to other people. For example, woman is as sure to have the suffrage as the tide is to rise, not because she is as wise, as strong, as skillful as man is, nor because she, like him, is a human being, nor for any other reason of likeness or duplication at all, but because she is different, because she can do what he cannot, because the world needs her peculiar and special abilities. It is because she is different, because these differences are fundamental world-needs, that it is necessary that she shall bring these differences to the service of the world. This fact, whether woman wants it or no, the suffrage will force inevitably upon her. Woman has been respon-

sible for the home—so she had her voice. Now she has thrust upon her a new, terrible, and glorious responsibility and opportunity, for the home and social aspects of the community. We insist that she must speak, but because she is different and not because she is like. The vote is no end in itself. To serve the community in ways in which she is the creator and specialist is the end, and toward this service the women of the civilized world are pressing, most of them unconsciously—a few of them consciously, but all of them inevitably.

WORK AS DISCIPLINE TODAY

The first and most profound respect in which the new world needs creative service is in the preparation which the community gives to children for the business of living in this new world. We are many of us distressed by the lack of responsibility which so many children show—their failure to understand and yield to the deeper needs of work and its place in life. This deeper moral equipment for life in the old days was associated with the faithful performance of the daily work in the home and the deep lessons which were learned by working alongside of the parents.

MANUAL ARTS

We have thought, however, that these lessons lay in the specific work done—so we have organized the elements of the work with tools into manual training, we have developed, systematized, organized, and pedagogicalized cooking and sewing into domestic science and domestic art (how prim and strange they do look in their new clothes), and we have put courses in these subjects into our schools. From two to four hours of laboratory work per week has taken the place of from six to twelve hours a day of real work with a real mother doing real work for real people in a real home. The result is that our children know more about the use of tools and the physics and chemistry of cooking and the art of sewing than did our grandmothers. And we are only just beginning to realize that learning how to do work in no respect has the character effect of doing work, and that being taught is one thing, and working with is another, and that knowing how, and having responsibility for, are all different in their effects upon life.

SOCIAL FUNCTION OF WORK

About cooking, for example, have grown most of the social feelings and customs of the family. To break bread or to eat salt together is a social fact far deeper in significance than is the knowledge of physics and chemistry involved in the cooking. To know cooking in its social sense—which is its important sense to all of us who are not to be cooks—is to have developed the art of human social intercourse and relationships. It is to make the body feed the soul. The college girl gets her chafing dish, not because she is hungry, but to feed her soul with the charm of comradeship.

I am not trying to say that the science of cooking is unimportant—but that alone it is mechanical. It and the whole family of sciences that can be taught and practiced in school do not furnish us with the equivalent in equipment for life that was found in the actual work of the home a century ago. Nor does it in any way equip the child with the newer social feelings and sense that are demanded of the adult in a modern community.

This is a rapid, tho I trust not superficial, sketch of the present world affairs as regards woman. To meet the new and larger responsibilities it is necessary that she shall:

1. Continue in her learning to do teamwork. To bring about home conditions of beauty, comfort, health, social happiness, and wholesomeness in the community means the very highest order of mutual loyalty and of teamwork. This is a new demand upon woman.

2. It is necessary that the consciousness of dignity, romance, and beauty be again restored to daily work, that it may once more take the fundamental place in the training of strong, true character.

3. The psychic relations between daughters and mothers have been hurt by those forces which have lessened their working together. These relations between mothers and daughters are not only to be brought back, but to be deepened and rendered more beautiful.

4. And last, and most important and most difficult, the nature of true social relations is to be so revealed that it is evident that the adventure, romance, and happiness are to be found in those human relationships which are found on the broad roads of life and work, rather than in its fenced-off sloughs and deserts.

The deepest need of woman is the need of being needed. This is why she responds to the sick or crippled child. If ever woman was needed, it is today. The very riot of our material riches is the peril of our souls. Woman is already taking hold of the present material world, giving to it and bringing into it the love and service and spiritual relations which in the old days created the home and which today are changing the man-made workhouse into a place adequate to the glorious future life of human beings.

The Camp Fire Girls is an organization which aims to bring the power of organization and the charm of romance again into the humble acts and needs of daily life. It is a deliberate attempt to help meet the new and splendid social world which is before us.

DEPARTMENT OF SUPERINTENDENCE

ST. LOUIS MEETING, FEBRUARY 27–29, 1912

SECRETARY'S MINUTES

FIRST DAY

MORNING SESSION—TUESDAY, FEBRUARY 27, 1912

The Department of Superintendence of the National Education Association met in the Banquet Hall of the Planters Hotel, St. Louis, Mo., at 9:30 A.M., President Charles E. Chadsey, superintendent of schools, Denver, Colo., presiding.

The meeting was opened with an address of welcome by Rhodes E. Cave, president of the Board of Education, St. Louis, Mo.

Before taking up the program for the morning, President Chadsey made announcement of the following appointments:

COMMITTEE ON NOMINATIONS

Ellis U. Graff, superintendent of schools, Omaha, Nebr.
Walter E. Ranger, state commissioner of public schools, Providence, R.I.
Ada Van Stone Harris, assistant superintendent of schools, Richmond, Va.
Otis E. Hall, superintendent of Montgomery County schools, Crawfordsville, Ind.
W. T. Carrington, president of State Normal School, Springfield, Mo.

COMMITTEE ON RESOLUTIONS

Francis G. Blair, state superintendent of public instruction, Springfield, Ill.
Reed B. Teitrick, deputy superintendent of public instruction, Harrisburg, Pa.
Bruce M. Watson, superintendent of schools, Spokane, Wash.
Charles S. Clark, superintendent of schools, Somerville, Mass.
M. E. Pearson, superintendent of schools, Kansas City, Kans.

The program for this first session was as follows:

Topic: Organization Affecting the Course of Study and Economy of Time

1. "Waste and Efficiency in School Studies"—W. H. Elson, superintendent of schools, Cleveland, Ohio.
2. "Departmental Teaching in the Elementary Grades"—W. L. Stephens, superintendent of schools, Lincoln, Nebr.
3. "The Child versus Promotion Machinery"—D. E. Phillips, president of Board of Education, Denver, Colo.
4. "Some Adjustments and Changes in the Course of Study and School Organization Suggested by the Needs and the Capacities of Children That Vary from the Standards Set for Average Pupils"—D. H. Christensen, superintendent of schools, Salt Lake City, Utah.
5. "The Junior High School: A New Plan of School Organization"—J. H. Francis, superintendent of schools, Los Angeles, Cal.

AFTERNOON SESSION

The meeting was called to order at 2:30 P.M. in the Planters Hotel Banquet Hall by President Chadsey, and the program was presented as follows:

Topic: The Determining of School Efficiency

1. "The Value of the Educational Commission in Determining the Efficiency of a City School System"—Calvin N. Kendall, commissioner of education for New Jersey, Trenton, N.J.

2. "The Relation of the Urban Community to Its School System"—M. G. Brumbaugh, superintendent of schools, Philadelphia, Pa.

3. "How May a City Best Determine Its Unmet Educational Needs?"—W. H. Allen, director of the Bureau of Municipal Research, New York, N.Y.

4. "Quantitative Tests in Education"—George H. Chatfield, secretary of the Permanent Census Board, New York, N.Y.

A discussion of the topic of the session was participated in by W. H. Maxwell, superintendent of public schools, New York, N.Y., F. V. Thompson, assistant superintendent of public schools, Boston, Mass., and W. H. Allen, director of the Bureau of Municipal Research, New York, N.Y.

EVENING SESSION

The evening meeting was held in the Banquet Hall of the Southern Hotel, and was called to order at 8:15 P.M. by President Chadsey. The following addresses were given:

"Ideals and Modern Education"—A. Ross Hill, president of the University of Missouri, Columbia, Mo.

"The Function of the Kindergarten in the American Public-School System"—Lucy Wheelock, Wheelock Kindergarten Training School, Boston, Mass.

SECOND DAY

MORNING SESSION—WEDNESDAY, FEBRUARY 28, 1912

The meeting was called to order by President Chadsey at 9:30 A.M. in the Southern Hotel Banquet Hall.

Previous to the consideration of the program as printed, H. B. Wilson, superintendent of schools, Decatur, Ill., spoke concerning the work of the Committee of the Department on Economy of Time in Elementary and Secondary Education, and presented the following motion:

I move the continuance of this committee for another year, the scope of the committee to be extended to cover the work of secondary schools, as well as that of the elementary schools; said committee to be known as the Committee of the Department of Superintendence on Economy of Time in Elementary and Secondary Education, and said committee to study and investigate with the aim of making a report and recommendations pertaining to the matter of economy of time in elementary and secondary education;

And, that it may be enabled to work on the problem in a thoro and extensive way, I move that this Department request the Council to recommend to the Committee on Investigations and Appropriations the setting apart of $250 to meet the necessary expenses of this committee.

This motion was duly presented and carried.

The following program was then given:

Topic: Problems Relating to Child Welfare

1. "The Duty of Superintendents in the Enforcement of Child Labor Laws"—Owen R. Lovejoy, general secretary of National Child Labor Committee, New York, N.Y.

2. "How Far Shall the Public-School System Care for the Feeble-minded?"—James H. Van Sickle, superintendent of schools, Springfield, Mass.

3. "The City Trade School—An Important Instrumentality for Improving the Vocational Need of the City Child"—Carroll G. Pearse, superintendent of schools, Milwaukee, Wis.

4. "How Should the School System Contribute to an Intelligent Choice of Vocation on the Part of the Pupil?"—George Platt Knox, assistant superintendent of schools, St. Louis, Mo.

5. "The Education of Girls"—L. D. Harvey, president of Stout Institute, Menomonie, Wis.

The annual business meeting followed the morning program, and was called to order by the president at 12 M.

Invitations from various cities desiring the 1913 meeting were first presented. The cities were: Boston, Mass.; Buffalo, N.Y.; Detroit, Mich.; Oklahoma City, Okla.; Palm Beach, Fla.; Philadelphia, Pa.; Richmond, Va.; and Washington, D.C. John W. Cook, president of State Normal School, De Kalb, Ill., and W. L. Stephens, superintendent of schools, Lincoln, Nebr., were appointed tellers. The first ballot resulted as follows: Boston, 15; Buffalo, 106; Detroit, 18; Oklahoma City, 141; Palm Beach, 87; Philadelphia, 150; Richmond, 84; Washington, 3.

Mr. Treasure, of Maryland, moved that the next ballot be confined to the three highest ranking cities. The motion was carried.

Mr. Foulk, of West Virginia, moved that if a third ballot be necessary, it be taken upon the two cities having the largest number of votes. This motion was carried.

Upon the second ballot Philadelphia received 316 votes; Oklahoma City, 195; Buffalo, 82. Philadelphia, having received a majority of the votes cast, was declared chosen as the place of the meeting of the department for 1913.

The report of the Committee on Nominations was presented by Ellis U. Graff, superintendent of schools, Omaha, Nebr., chairman, as follows:

Your Committee on Nominations begs leave to submit the following report:

For *President*—Franklin B. Dyer, superintendent of schools, Cincinnati, Ohio.

For *First Vice-President*—Samuel Hamilton, superintendent of schools of Allegheny County, Pittsburgh, Pa.

For *Second Vice-President*—Mrs. Ellor Carlisle Ripley, assistant superintendent of schools, Boston, Mass.

For *Secretary*—Burr Walter Torreyson, State Department of Education, Little Rock, Ark.

Upon the motion of the chairman the report of the committee was adopted, and the secretary was instructed to cast the unanimous ballot of the department for the persons named for the various positions. The ballot was so cast and the persons named were declared duly elected.

The following report of the Committee on Resolutions was presented by Francis G. Blair, state superintendent of public instruction, Springfield, Ill., chairman:

Your Committee on Resolutions presents the following resolutions, which it considers worthy of the attention and approval of the Department of Superintendence:

1. *Resolved*, That we express our hearty appreciation of the solid, earnest, professional character of the program presented before this, the greatest meeting in the history of the Department.

2. *Resolved*, That this Department recognize the Panama-Pacific International Exposition, to be held in San Francisco in 1915, as a great opportunity to exhibit our educational progress, and that we urge the state, county, and city systems of schools to prepare and to send such of their work as will reveal the development of all phases of education thruout the nation.

3. *Resolved*, That the members of this Department who are charged with the administration of public-school systems welcome and encourage all fair and candid investigation thru commissions or other agencies into the soundness and effectiveness of the policies and methods used and the results obtained, but that we condemn and resent all such investigations whose obvious purposes are to debase the systems or exalt the investigators.

4. *Resolved*, That we approve the work contemplated in the bill now pending in Congress providing for the creation of a Children's Bureau, but that we believe that it can be done more efficiently and economically by the Bureau of Education and that we hereby request Congress to appropriate sufficient funds to the Bureau of Education to enable it to do the work satisfactorily.

5. *Resolved*, further, That this Department of Superintendence of the National Education Association use every honorable means to secure from Congress a recognition of the nation-wide need for a great enlargement of the Bureau of Education, and that we urge Congress to provide the revenue necessary to carry into effect the wise policies recommended by the Commissioner of Education.

6. *Resolved*, That the Committee on Uniform Records and Reports appointed by this Department two years ago be continued in order to aid in the adoption and use of their records and reports by school officers.

7. *Resolved*, That we express our hearty appreciation of the hospitality of St. Louis and the welcome extended to us by the Board of Education and teachers, and that we especially thank Superintendent Ben Blewett for his courtesy and untiring efforts to make this meeting successful, pleasant, and profitable.

Respectfully submitted,

FRANCIS G. BLAIR, *Chairman*
M. E. PEARSON
REED B. TEITRICK
CHARLES S. CLARK
BRUCE M. WATSON
Committee

The report was adopted unanimously.

David B. Johnson, president of Winthrop Normal and Industrial College, Rock Hill, S.C., was next recognized. He presented the following resolution from the National Committee on Agricultural Education, and moved its adoption:

WHEREAS, The Page Bill, or Senate Bill Number Three, introduced by Senator Page in the Senate of the United States, seeks to accomplish the good purposes of the Burkett-Pollard and Dolliver-Davis bills and other good purposes not provided for in those bills, and has now been amended to suit the needs of all the states, and

WHEREAS, It proposes to co-operate with the states in encouraging instruction in agriculture, the trades and industries, and home economics in secondary schools; in preparing teachers for these vocational courses in state colleges of agriculture and the mechanic arts; in maintaining instruction in these vocational subjects in state normal schools; and in maintaining extension departments in state colleges of agriculture and mechanic arts,

Therefore be it resolved, That we indorse the Page Bill, or Senate Bill Number Three, and call upon the members of the United States Senate and House of Representatives to pass it promptly in the best interests of all the people.

Mr. Downing, of New York, moved that the motion be tabled. His motion was carried by *viva voce* vote.

David Felmley, president of the State Normal University, Normal, Ill., presented the following resolution and moved its adoption:

Resolved, That the Department of Superintendence hereby approve the action of the Modern Language Association and of the Illinois State Teachers' Association, in adopting in their publications and correspondence the simplified spellings recommended by the Simplified Spelling Board in its Circular No. 23, and we respectfully petition our National Education Association Board of Directors to adopt at their next meeting the same form of spelling in the publications and correspondence of the National Education Association.

Resolved, That a committee of five be appointed by the chair to present our above petition to the Board of Directors at its next meeting and to use their best endeavor to secure the desired action.

A motion to lay the resolution upon the table was carried by a standing vote of 173 to 128.

E. O. Vaile, of Oak Park, Ill., presented the following resolution and moved its adoption:

Resolved, That as an expression of the Department's appreciation of the action taken by the Modern Language Association, the American Dialect Society, and the American Philological Association, at their late meetings, indorsing the phonetic key alphabet adopted by the Department, February 24, 1911, it is hereby ordered that the resolutions passed by said societies be entered upon our minutes, and a copy of this resolution be sent to the secretary of each.

A motion by Mr. Blair, of Illinois, that the resolution be laid upon the table was passed by *viva voce* vote.

Arthur D. Call, district superintendent of schools, Hartford, Conn., moved as follows:

That the vote of this Department at the Mobile meeting adopting the Universal System of Key Notation be rescinded.

Miss Blake, of New York, moved that Mr. Call's motion be laid upon the table. This motion was lost by a vote of 129 to 150. The previous question was moved and carried. The vote upon Mr. Call's motion was then taken as follows: Affirmative, 154; negative, 93. Mr. Call's motion was declared carried.

The meeting was adjourned by the president without formal motion.

AFTERNOON SESSION

The members of the Department of Superintendence met in round-table conferences, as follows:

(A) ROUND TABLE OF STATE AND COUNTY SUPERINTENDENTS

Leader—Samuel Hamilton, superintendent of public schools, Allegheny County, Pittsburgh, Pa.

Topic: Agriculture in the Rural School

1. "The Educative Value of the Study of Agriculture"—Earl Barnes, lecturer on educational topics, Philadelphia, Pa.
2. "The Teaching of Agriculture in the Rural Schools: (*a*) To What Extent Can Agriculture Be Taught below the High School? (*b*) What the States Have Done in Teaching Agriculture in Rural Schools"—Philander P. Claxton, United States commissioner of education, Washington, D.C.
3. "The Next Step in Teaching Agriculture in the Rural Schools"—E. C. Bishop, Schools Section, Iowa State College, Ames, Iowa.
4. General discussion, led by Reed B. Teitrick, deputy superintendent of public instruction, Harrisburg, Pa.; F. L. Keeler, deputy superintendent of public instruction, Lansing, Mich.

(B) ROUND TABLE OF SUPERINTENDENTS OF LARGER CITIES

Leader—M. G. Brumbaugh, superintendent of schools, Philadelphia, Pa.

1. "Types of Special Schools in the Larger American Cities with Special Courses of Training for Special Groups of Children"—Andrew Edson, associate superintendent of schools, New York, N.Y.
2. "A Definite Propaganda to Impress upon the American Mind the Necessity of an Expansion of the Field of Education to Provide as Ample Facilities for Education by Work and Education by Play as Are Now Provided for Education by Study"—M. G. Brumbaugh, superintendent of schools, Philadelphia, Pa.

The following took part in the discussion of these papers: W. A. Greeson, superintendent of public schools, Grand Rapids, Mich.; J. A. Brooks, superintendent of public schools, Dallas, Tex.; David Snedden, commissioner of education, Boston, Mass.; J. S. Collins, assistant superintendent of public schools, St. Louis, Mo., and N. C. Schaeffer, state superintendent of public instruction, Harrisburg, Pa.

(C) ROUND TABLE OF SUPERINTENDENTS OF SMALLER CITIES

Leader—S. O. Hartwell, superintendent of schools, Kalamazoo, Mich.

1. "Scientific Study of School Work in Arithmetic"—J. T. Giles, superintendent of schools, Marion, Ind. Discussion led by Cliff W. Stone, State Normal School, Farmville, Va.
2. "The Unified High School"—W. A. Brandenburg, superintendent of schools, Oklahoma City, Okla.
3. "Utilization of the School Plant"—William A. Wirt, superintendent of schools, Gary, Ind. Discussion by Harlan Updegraff, Bureau of Education, Washington, D.C., and James G. Riggs, State Normal School, Oswego, N.Y.
4. Brief discussion of other suggested topics.

EVENING SESSION

The meeting was called to order at 8:15 P.M. in the Southern Hotel Banquet Hall by President Chadsey, and the following program was presented:

1. "Vocational Guidance"—Meyer E. Bloomfield, director of Vocational Bureau, Boston, Mass.
2. "America's Most Important Unsolved Educational Problems"—Philander P. Claxton, United States commissioner of education, Washington, D.C.
3. "The Schoolhouse as the Civic and Social Center of the Community"—Edward J. Ward, University of Wisconsin, Madison, Wis.

THIRD DAY

MORNING SESSION—THURSDAY, FEBRUARY 29, 1912

This session took the form of a joint meeting with the National Council of Education and was called to order at 9:30 A.M. in the Southern Hotel Banquet Hall by President Charles H. Keyes of the National Council. The program was given as follows:

1. "Report of Committee on Uniform Records and Reports"—Payson Smith, state superintendent of public schools, Augusta, Me. Discussion by Harlan Updegraff, chief of the division of school administration, Bureau of Education, Washington, D.C.; E. C. Warriner, superintendent of schools, Saginaw, Mich.; S. L. Heeter, superintendent of schools, St. Paul, Minn.; W. H. Elson, superintendent of schools, Cleveland, Ohio. General discussion by Walter E. Ranger, state commissioner of public schools, Providence, R.I.; Calvin N. Kendall, state commissioner of education, Trenton, N.J.
2. "By What Standards or Tests Shall the Efficiency of a School, or System of Schools, Be Measured?"

a) "The Scope and Plan of the Proposed Work of the Committee"—George Drayton Strayer, professor of educational administration, Teachers College, Columbia University, New York, N.Y.

b) "Some Determining Considerations"—James H. Van Sickle, superintendent of schools, Springfield, Mass.

c) "Rural-School Phases of the Problem"—Edward C. Elliott, professor of education, University of Wisconsin, Madison, Wis.

Discussion by Carroll G. Pearse, superintendent of schools, Milwaukee, Wis; Z. X. Snyder, president of Colorado State Teachers College, Greeley, Colo. General discussion by Charles H. Judd, director of the School of Education, University of Chicago, Chicago, Ill.; Lotus D. Coffman, supervisor of training, State Normal School, Charleston, Ill.; Frederick E. Bolton, director of School of Education, State University of Iowa, Iowa City, Iowa.

AFTERNOON SESSION

The meeting was called to order by President Chadsey at 2:30 P.M. in the Southern Hotel Banquet Hall.

The secretary read an invitation from the President and the Committee of Organization to participate in the Fifteenth International Congress on Hygiene and Demography to be held at Washington, September 23 to 28, 1912. Mr. Cook, of Illinois, moved that the president be instructed to make such appointments as are necessary to satisfy the courtesies of the situation. This motion was carried.

The program was then taken up, as follows:

1. "'The Bookman' in his Relation to the Textbook Problem"—Frank A. Fitzpatrick, manager of the American Book Company, Boston, Mass.
2. "The Effect on Education and Morals of the Moving-Picture Shows"—Joseph R. Fulk, superintendent of schools, Seward, Nebr.
3. "The Standardization of Janitor Service"—G. M. Wilson, superintendent of schools, Connersville, Ind.
4. "Relative Cost of Education of High- and Elementary-School Pupils"—Ernest O. Holland, superintendent of schools, Louisville, Ky.

At the close of the program the meeting adjourned.

HARLAN UPDEGRAFF, *Secretary*

PAPERS AND DISCUSSIONS

ADDRESS OF WELCOME

RHODES E. CAVE, PRESIDENT OF THE BOARD OF EDUCATION, ST. LOUIS, MO.

The heartiest of welcomes is usually the briefest, and as our welcome to you is indeed hearty, so shall I attempt to make it brief. There is an old quotation, no doubt familiar to most of you, but its appropriateness to this occasion is so marked that I cannot refrain from its repetition. It is said that that celebrated old teacher Florus, when asked with what patience he could bear to sit in the schools and teach boys, replied:

> I do not wonder that you are now of this opinion with which I also at one time struggled. For in the last four years I had become so wearied of my occupation that I did not think that a more wretched man lived. But afterward, reviewing and comparing my lot with the fortunes and labors of others, the beauty of the work which I had undertaken at length dawned upon me. Therefore you must know that no kingly power, no praetorship, no honor can be compared with this profession of ours. If the mightiest of emperors were to bestow on me a centurionship it would indeed seem no small honor, if he should grant me a praefectship or a tribunate doubtless it would seem the same; but if, then, not Caesar but Fortune grant me the gift to preside over honorable and generous boys, ought I not seem to you to have attained unto a beautiful and glorious office? For I ask you closely to consider this question, whether it is nobler to command men wearing the military coat or boys clad in the toga praetexta, barbarous and wild hearts or civilized and harmless ones? O, good Jupiter, how regal, how imperial it is to sit upon a raised platform modeling good characters and directing the pursuit of sacred literature.

Such, gentlemen, is the high, the true appreciation of the profession, of the art, of teaching. Such is the spirit which you must embody; such the conception of it with which you must be imbued. Such is the conception of it which we know moves and inspires our own superintendent. And with that spirit, in that feeling, and in that conception of this noble profession, it is an exceeding great pleasure not only to those gathered here, but to all our city, to open gladly our every door to you as the heads of that profession and to welcome you to our fullest hospitality. Ladies and gentlemen, we are indeed glad to have you with us.

TOPIC: ORGANIZATION AFFECTING THE COURSE OF STUDY AND ECONOMY OF TIME

A. WASTE AND EFFICIENCY IN SCHOOL STUDIES

W. H. ELSON, SUPERINTENDENT OF SCHOOLS, CLEVELAND, OHIO

OLD METHODS OF DETERMINING EFFICIENCY

The study of educational waste as a factor in determining the efficiency of the school is a modern practice. In the past the school was judged largely by the number of its graduates, by the estimate the college placed

on the work of the favored few who chanced to go to college, or by the exceptional student who "starred" in some particular study in his university career. Little or no account was taken of the great majority—of the number that "fell by the wayside" before reaching the sixth grade, to say nothing of those who withdrew before completing the course of the elementary school, or before graduating from high school. Nor was attention given to the length of time required to complete the course, or the number of times a pupil might have to go over the same work. In short, the whole question of educational waste was ignored. Indeed, for many the problem did not even exist.

NEW STANDARDS OF EFFICIENCY

In recent years, however, new standards of efficiency have arisen and new criteria for measuring the work of the school have been established. The school is brought face to face with its own losses. The demand is that the school shall adapt its work to the needs of the individual child, in view of his ability, opportunity, outlook, and interests. We have begun to judge the school by its power to hold pupils once they have entered; by its power to carry children thru the course on time; by its power so to adapt its work that a given unit may be covered in a given time. These new criteria of efficiency turn the center of administrative interest from the needs of the few and the strong to the needs of the many. They place new obligations upon the school—not of doing less for the intellectually bright and for those going to college—but the duty of doing more to adjust its requirements to the abilities of the average children, and of adapting its work to the needs of those who from choice or necessity must complete their education in the public school.

WASTE BY WITHDRAWALS

The failure of the school to hold its pupils is one of the great sources of educational waste. In Cleveland it was found that for a ten-year period but 48 per cent of all the children enrolled in the first grade reached the sixth, but 36 per cent reached the seventh, and that but one pupil in four attained the eighth grade. In a word, taking the records for ten years as a basis of judgment, it was found that only one child in two ever advanced in the elementary school beyond the fifth grade. In the high school it was found that for a ten-year period one child out of every three withdrew before the second year, one out of every two withdrew before becoming a junior, and two out of every three failed to graduate.

Nor do the records show that these losses within the school are due to its breaking-down in recent years, for taking the first half of the ten-year period, the percentage of those graduating from high school or completing the eighth grade is a trifle less than for the last half of the period, thereby showing a slight gain in holding power on the part of the school.

When the life-history of ten graduating classes of high school is made the basis of judgment, the losses within the school from withdrawals are surprisingly large. Broadly speaking, it seems reasonable to conclude that of those entering the first grade, 95 per cent leave without finishing the high school, 50 per cent withdraw before reaching the sixth grade, and 75 per cent before attaining the eighth grade; while of those entering the high school, one-third leave before the second year, and two-thirds drop out before graduating. This is fairly typical of the country at large. Naturally the question arises, to what extent is the school itself, in organization, instruction, course of study, standards of values, promotion-scheme, or otherwise, responsible for these losses and for its own lack of holding power?

WHY DO CHILDREN LEAVE SCHOOL?

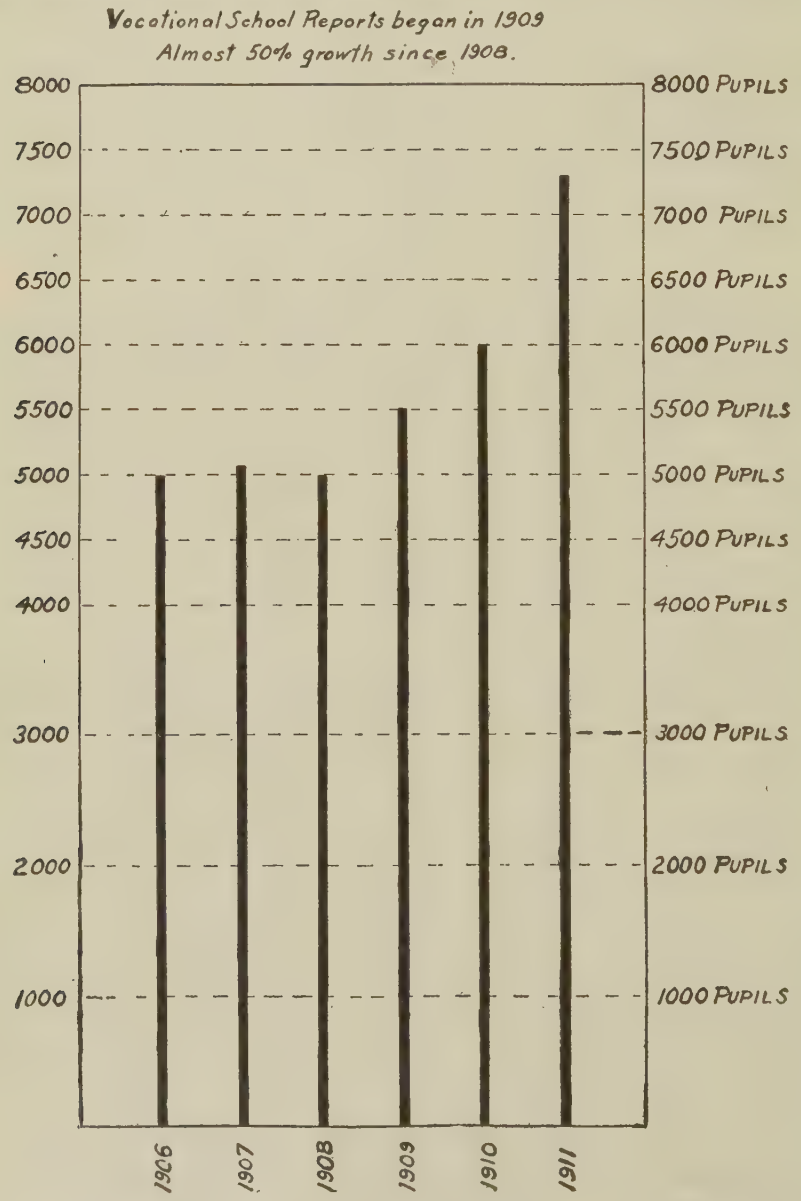
Accurate data bearing upon the causes of withdrawals from school are difficult to ascertain. The school cannot, of course, be held responsible for all the children lost to education by withdrawals; but in so far as the causes of withdrawal lie within the school itself, it must bear the burden of responsibility. It is important that careful record be made by all schools of the causes of withdrawals, to the end that a wide range of data may be made available, bearing upon the question as to why children leave school, and to warrant conclusions as to what extent the school itself is responsible for its losses. What is needed is data showing the actual effect on the holding power of the school due to changes in organization, courses of study, methods of promotion, etc.

In this connection I submit data showing the influence of practical courses in attracting and holding pupils of high-school age. Previous to 1908, Cleveland had six high schools offering the usual college-preparatory courses. In 1908 a technical high school was opened, offering four-year courses frankly preparing for work, without regard to college-entrance requirements. This school opened with 729 pupils, of which 484 had just completed the eighth grade, 122 were transferred from other high schools, and 123 were recruited from shops and factories—children who had left school and had gone to work, but who were attracted by a vocational school of this type. The next year a high school of commerce was opened, following similar lines of practical efficiency as that of the technical high school. The following table shows the influence on the holding power of the school as affected by courses bearing an immediate and close relation to the everyday activities of life.

ATTENDANCE IN CLEVELAND HIGH SCHOOLS

Year	1906	1907	1908	1909	1910	1911
College Preparatory...	4,983	5,059	4,989	4,787	4,436	5,293
Vocational.....	.....	.....	.....	729	1,560	2,005
Total.....	4,983	5,059	4,989	5,507	5,996	7,298

The above data show that in three years previous to 1908–9 the high schools did not grow, notwithstanding the city was growing at the rate of two thousand school children each year, as shown by the school census.



This is in no sense the fault of these schools, but is merely the inadequacy of a single type of school to meet the needs of all the children in a community. In 1908 vocational high schools were started, the technical in

1908, and the high school of commerce in 1909. The result is a growth in high-school attendance from 4,989 in 1908 to 7,298 in 1911—almost 50 per cent gain in three years. Moreover, it is to be observed that vocational high schools have started growth in the college-preparatory schools, and all are sharing in the revival of high-school prosperity. While for three years previous to the opening of vocational high schools the college-preparatory schools did not grow, yet these schools reached their highest enrollment in 1911, at a time when more than two thousand children were in attendance at vocational high schools. An increase of 50 per cent in high-school attendance within three years, the creation of a new high-school constituency, tends strongly to the belief that the holding power of the school is tremendously affected by the *variety of opportunity* offered, and by the relation which the school establishes with everyday activities thru the study-courses which it offers. The correcting of the maladjustment between the school and the industrial and business world outside the school, will have a marked effect in overcoming educational waste.

WASTE BY RETARDATION, REPETITION, AND NON-PROMOTION

But losses by withdrawals are affected also by retardation, for when children fall behind their grade they leave school in large numbers. In a typical city the records show that, exclusive of all special schools, one-fourth of all elementary pupils were retarded one to four years. Since these data take no account of those having withdrawn, it is apparent that conditions as to retardation are even worse than these figures indicate; for by the sixth grade more than half of those enrolled in the first have left school. Without regard to cause, retardation can have but one effect, and that is to deprive many children of the work of certain grades of the school. Since retardation is the direct result of going over the work a second time, repetition produces lamentable waste. Even in the upper grades, which deal each successive year with an increasingly select group of children, the percentage of repetition is surprisingly large. From data available it seems reasonable to conclude that, of all money spent on public education in American cities, one-tenth to one-eighth is spent on taking children over the work a second time, an enormous loss considered from any point of view. As a money tax, paid for the maladjustment of study-courses and promotion-schemes to the abilities of children, it is excessive. When the school is tested for efficiency by its ability to carry children thru its course on time it shows great waste.

But just as repetition causes retardation, so non-promotion is the prime factor in producing "repeaters." Obviously, the causes leading to non-promotion are many, some of which are beyond the responsibility of the school. However, the degree of the burden of responsibility which the school bears can be determined only in view of a wide range of data showing the causes of non-promotion. Every school should, therefore, keep careful

record of actual causes of non-promotion. From the limited data available it would seem that three-fourths of the non-promotions are accredited to incapacity and indifference on the part of children. This suggests strongly the need for a revision of standards of attainment and a readjustment of the course of study, adapting it to the abilities of the children. For the maladjustment of the work of the school to the capacities and interests of children is expressed in terms of withdrawals, retardation, repetition, and non-promotion. The thoughtful student of educational waste cannot fail to reach the conclusion that the school is addressing itself to the stronger group, and setting its standards of attainment beyond the range of the average children.

METHODS AND STANDARDS OF PROMOTION

Doubtless no one factor penetrates so deeply into the life of the school and has so much to do with educational waste as methods of promotion; for these involve standards of attainment and modes of advancing children from grade to grade, as well as from school to school. To a large extent, plans of promotion have developed traditionally and without much regard to their effect on school losses. But the time is at hand when standards of attainment must be redetermined, and a plan of promotion devised in view of its effect on withdrawals and repetition—a plan which shall enable children as a rule to complete the elementary-school course on the average in eight years, and the high-school course in four years. Such a plan must be so flexible that each child shall be permitted to advance thru the school according to his ability and effort. It must allow the bright child to advance in less than the average required time, and even tho the slow child may take longer, the average, when all the children passing thru the school are taken into account, should not be more than eight years for the elementary, and four years for the high school. It must offer the "square deal" to all children. Such a method of promotion can be devised and administered only in view of a large body of facts with regard to failures in studies, withdrawals, retardations, and non-promotions in a given system of schools.

A PROBLEM IN WASTE AND HOW IT WAS SOLVED

In Cleveland the following conditions obtained: It was found that for a ten-year period only one child in two ever advanced beyond the fifth grade; that one child in four was retarded one to four years; that every tenth child was a "repeater"; that 11 per cent of all elementary-school pupils failed of promotion.

These facts with reference to withdrawals, retardation, repetition, and non-promotion were brought to bear in determining a new promotion plan and in redetermining the length of the school year. To reduce repetition, the annual plan of promotion was abandoned, and a term plan inaugurated.

A term of twelve weeks was made the unit. At the end of this period children are reclassified, and when non-promoted the pupil repeats only twelve weeks of work.

Acting on the theory that there were as many pupils in the school who could do more than the average amount of work required as there were pupils who could do less, opportunity was made for the more rapid advancement of bright pupils. Since the non-promotions less accelerations amounted to one in ten, provision was made that 10 per cent of the pupils in any room might be given a double promotion, that is, jumped over a term's work; provided, however, that no pupil might be given a double promotion unless his standing for the term in all studies was 90 per cent or above, and that no pupil should be given more than one double promotion in a single school year. Tho double promotion of a given number of pupils will by no means eradicate repetition and retardation, yet in time the number of children repeating will be equalled by the number given double promotion, and the number of children behind their grade for their age will be offset or balanced by the percentage of pupils ahead of their grade. A school system thus becomes its own clearing-house, is made to check itself, and certain bad effects of repetition and retardation are neutralized. In this way the money cost of the "repeater" is offset by the acceleration of the stronger pupils.

SUMMER SCHOOL REDUCES WASTE

That it might be possible for the large number of retarded children to advance farther in the course of the elementary school, the regular school year was divided into three terms of twelve weeks each, and a twelve-week summer school, offering regular work and giving regular credits, was established, attendance being optional.

The twelve-week summer term makes a unit of work corresponding to a unit of work of the regular school year. Retarded children by taking advantage of the summer term are enabled to reduce the degree of their retardation and advance farther in the course than formerly. Three high schools were opened for regular work for a twelve-week summer term—a college-preparatory high school, a technical high school, and a high school of commerce—to which pupils from all parts of the city were eligible. Under this arrangement pupils taking advantage of the twelve-week summer term complete a four-year course in three years. In the elementary schools there were enrolled in the summer term of 1911, 4,187 pupils, and in the high schools 1,279, a total of 5,466.

In the elementary schools 3,245 children made up a term's work, thereby reducing their amount of retardation to that extent, while 276 of these received a double promotion. Thru the summer term and the increased flexibility of the plan of promotion the school system practically

checked its own losses and created a balance sheet, the number of children who lost time being equalled by the number who gained time. Moreover, the number of withdrawals was reduced over the preceding year by 2,633.

It is to be noted, however, that a regular summer term, correlating with a unit of work of the regular school year, offers no "bargain-counter" concessions to summer-school attendance on the part of retarded children. On the contrary, it merely offers a regular term's credit for a regular unit of work, done in the regular way. But a summer term which does not correlate with a unit of work of the regular school year, as must be the case under an annual or semiannual promotion plan, is reduced to the mere problem of allowing failed children an opportunity to remove their condition in certain studies. As a means of making up lost time and reducing retardation it offers merely the impossible, and does violence to children, since they must either fail of advance credit or be given credit for work which they have not done.

Whether a thirty-six-week school year and a twelve-week summer term, optional to children, and whether this mode of promotion will prove ultimately desirable, experience alone can tell. But as a method of solving the problem of educational waste, offered by the set of conditions above outlined, it has proved thoroly effective. Every school system offers its own set of conditions and its own special needs. At all events, these plans are illustrations of how definite knowledge of school conditions may be used in attempting to meet actual problems of administration. What is needed is that the course of study and the method of promotion shall be so adjusted to the abilities and needs of children that the average children advance thru the grades at the normal rate, the slower requiring more time, and an equal number of bright children requiring less than the normal time in which to do the work.

NEED FOR STANDARDIZING SUBJECTS, DEPARTMENTS, AND SCHOOLS

Notwithstanding that the value of studies is fixed by the time allotted in the daily program, study-requirements in actual practice seemingly have little relation to the value ascribed. Reading, for example, in a given system of schools is given 25 per cent of the total time of the elementary school, language and grammar 12 per cent, arithmetic 15 per cent; in the first year of the high school, Latin, English, and algebra are given like value. Nevertheless, the failures in language and grammar were, in view of the time value, almost four times as many as in reading; those in arithmetic five times larger; whereas in the first-year high-school classes 26 per cent of the children dropped out or failed in Latin, 15 per cent in English, and 32 per cent in algebra. Where records of failures in studies are properly kept it is not difficult to locate the studies that are the great offenders in swelling the ranks of the non-promoted.

Such variations reveal a need for standardization, not only in studies,

but in departments as well. Standards for completing a study of great value should be such as will actually put the emphasis on that study, rather than that pressure on one study when measured by the time allotted should be two to twenty times as great as upon another. But until positive data are collected with reference to failures in studies in the various grades, and these data made the basis of administrative action, little can be accomplished in equalizing and standardizing study requirements.

There is similar need with regard to standardizing individual schools, for there is wide variation in the standards of the several schools in the same system. For example, in a given system of schools, the failures in reading, based on total enrollment, ranged from 0 to 25 per cent; in language and grammar from 0 to 34 per cent; in arithmetic from 0 to 37 per cent; while the percentage of non-promotions for individual schools ranged from 0 to 47 per cent in the first grade; in the second from 0 to 38 per cent; in the eighth grade from 0 to 55 per cent. Such variations in standards in a single system can scarcely be countenanced. That schools should be rightly judged with regard to their work, and that there should be reasonable uniformity of requirements in different schools, there can be no doubt. Yet before this can be brought about data must be collected with reference to failures in studies and non-promotions in different schools; upon the basis of these, city-wide standards fixed, and the requirements of individual schools equalized.

CONCLUSION

A study of educational waste forces the conclusion that in the collection and use of data to guide in measuring the efficiency of the school and in determining administrative action, a mere beginning has been made; that if the efficiency of the school is to be definitely measured careful record of school losses must be kept, to the end that study-courses and promotion-schemes may be adapted to the abilities, needs, and interests of all the children, and the school itself be thereby enabled to check its own waste.

B. DEPARTMENTAL TEACHING IN THE ELEMENTARY GRADES

W. L. STEPHENS, SUPERINTENDENT OF SCHOOLS, LINCOLN, NEBR.

The tendency thruout the country toward departmental teaching in the more advanced grades of the elementary school is pronounced. This tendency has in the main resulted from the following generally prevailing conditions: (1) the difficulty of securing efficient teachers for the upper grammar grades; (2) the desirability of preparing pupils to assume more easily and successfully the larger freedom and responsibility of the high school; (3) the vitalizing of instruction by the specialist to the end that the waste resulting from unskilled teaching may be lessened.

The influence of these conditions led to the introduction of departmental teaching in the elementary schools of Lincoln three years ago. Four of the ten grammar schools are using the plan, the essential features of which, as adapted to our work, are as follows:

1. The sixth, seventh, and eighth grades are included in the departmental scheme.

2. Four clearly defined departments have been created, i.e., mathematics, geography and history, grammar and composition, literature. Music is assigned to one of these departments; art to a second; and writing to a third. Each teacher gives instruction in spelling, civic and moral training, and hygiene.

Furthermore, each teacher is held responsible for the instruction of the pupils in the correct use of English in speaking and in writing.

3. Each class has a teacher, termed the class sponsor, with whom it spends in recitation and study about one-third of the time, and who is responsible for the general conduct and attendance of the class.

4. No pupil recites to more than four teachers. This number does not include teachers of manual training, cooking, and sewing.

5. Weekly conferences of the departmental teachers with the principal are held, to unify and correlate the work and to discuss the needs of individual pupils.

This plan has been in operation for a time sufficiently long to justify the drawing of certain conclusions with reference to its dangers and weaknesses as well as with reference to its advantages.

The first danger likely to be encountered in instituting the plan results from over-departmentalizing the work. Pupils should not be required to spend the whole day in the department. Not less than one-third of the time should be spent with the class sponsor, whose influence will largely mold the general welfare and deportment of the pupils. She is the anchor that will prevent the pupils from floating out of sight of land. A common objection raised to departmental teaching is that the influence of the teacher over the pupils is materially lessened. In grades below the sixth, in my judgment, this is true. But even under the single-teacher plan inherent weaknesses exist that lessen or overdevelop this influence. Many teachers who are considered efficient do not influence favorably all the individuals under their charge. Many children are not reached in a wholesome manner by the personal attraction of the teacher. Incompatibility of temperament, mannerisms, voice, or dress may exert a harmful effect upon certain children, and this often results without realization on the part of the teacher. Moreover, the "mothering instinct" is too highly developed in some teachers. They have come to consider the chief function of the teacher that of protection and coddling. In such a presence, pupils fail to realize that school is a workshop wherein they grow to independent thought and action thru their own initiative. To remain a year with such a teacher spells disaster to many a pupil during his school career. These weaknesses of the single-teacher plan are not advanced in the attempt to strengthen the argument in favor of departmental teaching, but simply to remind you that dangers lurk in both systems.

However, in the departmental plan, every pupil will find some teacher to whom he is strongly attracted and whose influence will be continuous for several years. I recall a teacher in one of our departmental schools who especially appeals to boys and whose desk at intermissions is usually surrounded by lads eager to secure her advice relative to all their school activities. To another teacher, the girls are attracted; they tell her freely of their difficulties and troubles, even more freely than many of them tell their mothers. The influences that flow in upon pupils from several teachers are more like those of life. In the home and on the playground the child is not subject to the influence of one person wholly, but to the influence of many. As a result of this composite influence the child is more likely to develop symmetrically and to preserve his individuality than if he were too constantly under the influence of one person alone. In my judgment the intimate, rare, and lasting relations between teacher and pupil are more common under the departmental plan than under the single-teacher plan.

The second danger of departmental teaching is the confusion that arises because of the pupil's contact with several teachers whose standards of requirement and whose methods and ideals of teaching differ widely. A sixth-grade boy expressed the idea in this way: "Just when I have found out how to do things the way one teacher directs, I'm sure to be in trouble with another if I follow the same plan. I can't always remember which is which." Closely related to this, is the fact that no one teacher realizes all the problems and difficulties that confront the individual pupil, and in her zeal to promote the interest and magnify the importance of her department, she forces the child beyond his power of endurance and assimilation. Herein lies the greatest danger of the departmental teaching. To meet these difficulties we have found the following methods of procedure necessary:

1. Regular weekly conferences of the teachers and principal, at which the character and scope of the work being done by each is discussed. At these conferences the possible correlations of subjects are determined. Length of assignments and amount of home work required in each department are discussed, so that each teacher realizes all the demands made upon the pupil. The weakness of a pupil in any department is disclosed and his work in the other departments is also discussed. In this way the teachers get in mind the whole work of the child, who in turn gets a fair and impartial rating. These conferences are of the most vital and far-reaching consequences. The status of the individual pupil is established, the interdependence of studies pointed out, and the vision of the teacher enlarged.

2. Clearly outlined courses of study, so that the scope of the work is clearly understood by the teacher and the temptation removed as far as possible from the overambitious and enthusiastic specialist to go beyond the required work of her department.

3. The admission of pupils to the department not earlier than the seventh grade. We admit the sixth grade to the department in order to make available four teachers for departmental teaching, but after a three years' trial, I am convinced that sixth-grade pupils do not carry successfully the responsibility imposed and are confused by the contact with several teachers. At the earliest opportunity we shall revert to the single-teacher plan for the sixth grade and employ an additional teacher for the departmental work.

There is, however, one advantage in having the sixth grade in the department. After having the opportunity to become thoroly acquainted with the pupils in the sixth grade, the departmental teachers find the adjustment between sixth- and seventh-grade work easily made, and more can be accomplished by the pupils during the two remaining years of the grammar-school course.

Thus far the paper has dealt with the dangers of departmental teaching and the manner in which these dangers can be lessened or eliminated. Let us turn to a consideration of the advantages.

Under departmental teaching the discipline is materially improved. Some reasons for this are disclosed in the answers of the pupils to this question, which was sent to all eighth grades in the departmental schools:

"Do you consider the plan of departmental teaching superior to the plan formerly used? Give your reasons for your answer."

Ninety per cent of the pupils favored the departmental plan. Of those favoring the plan 80 per cent gave these two reasons:

The change and relaxation in passing from room to room kept them alert and prevented restlessness.

The teacher, confining her efforts to one or two subjects, became more expert in teaching and made the class work more interesting and more easily understood.

These statements of the pupils themselves are significant. The educative value in coming in contact with different teachers and different environment during the day is restful, pleasing, and stimulating. Furthermore, the pupil realizes that he is a member of a larger social group, whose activities if directed aright will be more influential for good in the life of the school than those of a smaller group. He feels his importance more keenly and realizes that it is possible for his influence to have a wider sweep, therefore he is willing and anxious to assume larger responsibility. He is impelled to exert all his powers to meet successfully this larger opportunity, which is presented at the very time in life when he has an uncontrolled desire to be like the "grown-up," to bring things to pass, to go forth relentlessly to hunt the dragon and when he is found to slay him on the spot. Thus boys and girls find themselves. Under the single-teacher plan a pupil may cease endeavor because he believes, and the belief is an honest one, that the teacher is partial, unjust, and unsympathetic. Under the departmental plan, if the pupil discovers that several teachers are placing the same estimate upon him, he begins to realize that the fault must lie within, and such realization is the first step toward reform. The opportunity, then, to relax at the end of a recitation period, to come in contact with different environments which produce variety in reactions, and to become a part of a larger social whole wherein lie larger responsibilities and opportunities, produces the most wholesome disciplinary effects.

Better equipped classrooms have resulted from departmental teaching. The apparatus for the teaching of history and geography, including maps,

globes, stereopticon, and other illustrative materials, is collected in one room. A similar plan is followed in the rooms devoted to the work of other departments. The advantages are obvious. All the material for use in a given subject is to be found in one room, ready for instant use, instead of being scattered in three or four rooms, meagerly equipping any one room, and making it necessary to convey equipment from room to room. Often the apparatus needed for illustration, arising from some unforeseen condition in the recitation, is in another part of the building, not subject to the principle of "the recall." Under the single-teacher plan the instructor is in almost constant distress over exchanging hurriedly the illustrative materials used in one recitation for those to be used in the following recitation. This shifting of scenes to keep the performance from dragging often reminds one of continuous vaudeville. In the departmental plan, these difficulties are almost entirely removed, and instead, each room with its proper equipment has an atmosphere characteristic of the subjects therein presented, which has a most refreshing and stimulating effect upon the pupil as he enters.

Another advantage lies in the added efficiency from the standpoint of administration. Several factors are involved in this phase of the problem. Under the single-teacher plan, when a class begins the work of a new term in all subjects under a new teacher, several weeks may elapse before the understanding between the class and the teacher is sufficiently clear and sympathetic to bring satisfactory results. In departmental teaching, the class will never begin a new period under an entirely new corps of teachers.

Responsibility for results in any subject can be fixed with more certainty. This is a decided advantage from the viewpoint of administration. For example, if glaring weaknesses are disclosed in mathematics by the supervision, the teacher of this subject cannot escape responsibility by attempting to heap censure upon the previous teacher. One of our teachers may have taken herself too seriously when she said: "If a decimal point is discovered out of place in this building, I can't escape the responsibility," yet she was in a frame of mind to render effective service.

The unity and force of the management is further increased by reason of better preparation for, and closer articulation with, the high school. About one-half the time devoted to study is spent under the direct supervision of the teacher for whose recitation the pupil is making his preparation. The remaining study periods are spent in independent study. This plan enables the teacher to give definite directions to the pupil how to study; it also affords the advantage of throwing the pupil upon his own resources in study. This independent study, together with the training the pupil acquires in adapting himself to the methods and ideals of instruction given by several teachers prepares him for the larger freedom and responsibility characteristic of the high school. At the risk of digressing somewhat at this point, I wish to say that on the whole the effect of departmental teaching upon the

pupil is wholesome. The opportunity for freer action is afforded; the forming of independent judgment, encouraged more consistently. The dull pupil thrives better, because the specialist is more keen in discovering latent talent. He seeks the advice of the teacher whose personality appeals to him most strongly. Favoritism is lessened; and pupils are kept in school longer.

Under the departmental plan more skillful teachers will be developed. This will result first thru a process of elimination. It not infrequently happens that teachers who under the single-teacher plan are rated as satisfactory fail in the departmental work. This is probably due to one of two reasons, possibly to both. Pupils, as they come in contact with several teachers, rapidly grow in their ability to distinguish superior training and teaching ability. At the same time, they discern more keenly the lack of these on the part of weak teachers and take advantage accordingly. The latter kind of teachers must be removed from the department or disorganization is likely to follow. It should be noted here that the departmental plan necessitates more searching and intelligent supervision on the part of the principal. This plan does not possess such inherent power that, once let loose in a school system, it will run itself. The principal must constantly "be on the job" and in sympathy with it. As a result of this closer supervision, the weaknesses of the teacher will be more surely revealed.

The development of more efficient teaching will result, in the second place, from the opportunity afforded the teacher to specialize in one or two subjects or in a group of related subjects. It is distressing to note what is expected of the teacher under the single-teacher plan. A few of the subjects that she is supposed to teach are herewith enumerated: arithmetic, algebra, geometry, history, geography, composition, grammar, literature, music, art, spelling, writing, civics, morals and manners, elements of science, including botany, physics, astronomy, geology, hygiene with special reference to the effects of stimulants and narcotics, essence of patriotism (whatever this is), and physical training. The time allotted to this paper forbids the mentioning of others. If there is anything more perfectly designed to drown out the spirit of study and investigation on the part of the teacher than this deluge of subjects, such has not yet been revealed in the realm of human knowledge.

To secure teachers properly prepared for departmental teaching constitutes a serious problem. Our present plan is to select from the system at large those teachers who have shown unusual skill and interest in teaching a given subject. The state university offers courses after school hours and on Saturdays in order to give these teachers an opportunity for further specialization. The development is slow but ultimately success is assured. The normal schools should recognize the fact that departmental teaching in the elementary schools is rapidly gaining in favor, and should so remodel and extend their courses that the specialist may be trained for work of this

character. The training now received in the normal schools does not prepare for such teaching. In the end the departments will demand the teacher whose training is little, if any, less than that of the high-school teacher, and a salary commensurate with the training demanded must be paid. As a result of this preparation, the lives of boys and girls will measurably be enriched, not by adding subjects to already congested curricula, but by the teachers' bringing a broader view, riper scholarship, and richer illustrative material to bear upon the interpretation and presentation of what we now have.

In conclusion: If the adaption of departmental teaching to the upper grammar grades is made with the following necessary provisions: avoidance of over-departmentalization; frequent conferences to determine the needs of the individual pupil and to correlate sanely the work of the departments; the hearty sympathy for, and belief of principal and teachers in, departmental teaching, results more satisfactory than those found under the single-teacher plan will be secured. The discipline will be more wholesome, classrooms better equipped; stronger unity and force in school management evolved; better preparation for the larger responsibilities of the high school acquired; a more skillful corps of instructors developed, whose teaching will be vitalized by the spirit that nourishes the life and growth of the child for whose welfare the school exists.

C. THE CHILD VERSUS PROMOTION-MACHINERY

D. E. PHILLIPS, PRESIDENT OF BOARD OF EDUCATION, DENVER, COLO.

I find that a paper presented to this body thirteen years ago apologizes for presenting a matter of "minor consideration."[1] I apologize for lack of ability to make clear in twenty minutes the paramount importance of this subject in relation to the entire educational system. I declare it second to none save that of the direct moral welfare of the child, and it also has much to do with moral life.

I also find that thirty-two years ago, the sane and sensible statement was made to the National Education Association *that promotions should be made at any time during the term, whenever a pupil is prepared to take up and understand the work of the next higher grade.* Yet today I have among my replies howling objections to this sensible statement, calling it "chaos" and a "retrogression of our excellently perfected machinery." It was about this same year, 1881, that Superintendent Howland of Chicago took the breath out of the high-school principals by announcing that henceforth all pupils would be admitted to the high school on the grade principal's recommendation, and on that alone. The poor high-school teachers felt hopeless without some definite percentage to tell just how much *past* knowledge to expect of the child. The horrors of not knowing whether the dead line of 75 per cent

[1] W. W. Chalmers, "Report," 1899.

had been passed! This was a master-stroke of administration. Its fruits have spread to the whole country.

You are all familiar with that valuable report of the New York and Brooklyn teachers' associations. I have intentionally directed my remarks to points not made prominent in that report. The thoroness of that work will account for some of the omissions in my brief paper. But if anyone can pass in silence some of the statements, not by the committee, but by educational correspondents, on such subjects as "allowing a child to work to his fullest capacity," and "doing over work satisfactorily passed," it is more than I can do.

The committee well states that "the rapid evolution during the past twenty-five years of the American common-school system of education into a hard-and-fast graded system is universally recognized"; that "no adequate incentive for highest endeavor is inherent in our present graded system." I heartily agree with the committee that our primary aim should be to put the child where he may work up to his fullest capacity to the best advantage to himself as a child.

My remarks are based upon a short practical experience some years ago; upon the study of educational problems; upon observations of the practical working of the very system which many call *ideal*, but declare impossible because they have never given it a proper test; and finally upon about two hundred replies from grade- and high-school principals and from superintendents concerning this subject. Nearly all of these replies are from the Rocky Mountain States; two-thirds of them from my own state. Twenty minutes afford no time for details of the many systems in use. I shall attempt to bring to your minds five ideas:

First, the two dominant and opposite tendencies as represented by my returns.

Second, several significant efforts to take care of the backward and the bright pupils, not coming under the general systems; such as, the Cambridge, the Pueblo, the Batavia, etc.

Third, to show that the method of daily percentage grades with final or periodic *examination-percentages*, by which the fitness of a child to be promoted is determined, is absolutely pernicious, unjust, and productive of intellectual chaos. It is this topic that the valuable report to which I referred has entirely omitted. In many ways I believe it more important than the promotion itself.

Fourth, the cloud that is in some places settling over our country schools.

Lastly, I shall try to maintain that each child should at all times be at work in the grade and in the subjects that he can get most out of, without regard to what he knows or does not know about studies behind him, and without regard to how much less or more he knows than other pupils.

Let us now turn to a brief consideration of these five points.

1. A few representative quotations from the returns must suffice.

The old conservative hard-and-fast system and the power of tradition are still powers in practice, if not in theory. A superintendent writes: "We have mid-year promotions in only a part of our subjects. In others it is a whole-year credit or nothing. We reserve the privilege of counting

25 per cent on application, and may *fail* a student who passes a *good examination.*" Another says: "Numerical grades are sent to the office to be used in special cases." A grade principal says: "We promote on the half-year plan. Provided a student fails in more than half his work, he is required to take the entire half-year's work again." Again: "Promotion is dependent upon making a certain fixed average with the exception that a child may be promoted on condition, if he is low, not to exceed two studies." The same principal adds that he has a boy in the eighth grade who did not pass the seventh, who is making up and will finish the eighth all right. Another says: "I favor, in theory, promotion by subjects. This we find difficult in practice." A superintendent of some twenty-five teachers writes: "We have numerical grades. This seems to be a necessity that we may know where we are at. There must be some guide and locating-place." Another superintendent says: "The term *promotion-machinery* is more dreadful in name than in actual operation in well-regulated schools." A principal of a large grade school writes: "We have numerical grades and pupils are required to attain a certain minimum standing in order to be promoted. However, our superintendent has a rule which he calls 'service promotion,' under which pupils are promoted after two years in one grade."

The best statement of the conservative method of promotion on a *percentage-basis* comes from a superintendent of one of the first-class districts in Colorado. "I would say that we base our promotions primarily upon percentage of grades earned in the more important studies. The plan of making promotions entirely on the judgment of the teacher may be excellent in theory, but in actual practice it very often produces grave annoyances, such as the feeling that the teacher is partial to certain children, but has it in for certain other children, who thus do not have a fair opportunity. When there are carefully selected questions given to the pupil who is old enough to answer in writing, it gives the child an opportunity to make a record concerning which there can be no reasonable dispute. . . . . After the child has gone over the same work two or three times it is our custom to promote that pupil 'by courtesy.'" Again, a principal of a large high school says: "Yes, we have used the numerical system of grading, feeling that it tends to *carefulness* and *accuracy* on the part of teachers."

This is a glimpse of what I should call the conservative undercurrent; but I am rather sure that nearly every one of these would claim to be quite progressive.

Now just listen to a few conservative sentences taken from page 86 of the report already cited. In response to the question: Should the child be placed where he may work up to his fullest capacity? here are some of the things that have been said: "No, it makes them unbalanced." "No, such a condition is imbecile." "No child should get to the high school before fourteen years." "Pushing children through the grades and out at the top before they are mature enough in body and mind to profit by

secondary education is akin to man-slaughter, for it is little short of child-slaughter." "It is a crime against childhood to crowd children through the grades." "I do not believe it wise to advance precocious children more rapidly than is provided by regular promotion." This makes me want to fight on behalf of the God-gifted child that is not yet able to fight for himself.

Now a few remarks from what may properly be called the liberals or radicals. From my returns I condense the following: "The old system is vicious, and has literally slain its thousands. Bright girls have been held for all the work of a grade because the teacher's recitation book and examinations only totalled 64 per cent instead of 65, perhaps in a single branch, perhaps arithmetic. This is the only question I ask any teacher to decide: Has the pupil power to do the work of the next class or subject? If so let him do it and do it now." Again: "For twenty-one years I have had no system. Systematized promotions tend to defeat our end—to advance the child according to his capacity. A hundred or more promotions have been made already this year, and only in two or three cases did we make a mistake. They are easily corrected." A superintendent says: "If promotion periods are too far apart the boy with red blood—the leader—resents such conditions; and if not relieved, breaks out into the world where he feels he has a fighting chance." "My trouble," writes a principal, "is to have teachers realize that the child is greater than any system. I hope I was never so devoid of *common-sense* as not to place a pupil in the *highest* grade in which he was able to do satisfactory work." A principal who for many years has run a large school, who has demonstrated the falsity of the claim of necessity for grades and stated examinations, the absolute falsity of the repeated statements that a school run under flexible conditions costs more, and the falsity of the statement that promotion by subjects in the grades will not work, writes me as follows: "Pupils are promoted from class to class and from grade to grade at any and all times; so soon as a pupil is discovered who can do, or should be doing more work, no matter what the grade, if the *physical* condition permits extra effort, he is advanced. It often occurs that pupils are promoted who are required to recite in two classes, until evenness in grade work is attained. No examination for these promotions is required." Again: "Whenever a child has the power to do advanced work he should be promoted, and by the application of common-sense any teacher should know fairly well when that is."

About one hundred and fifty communications are of this liberal type and the writers are practicing what they preach, and thank the Lord they have nearly all abandoned that *make-believe* justice of recitation percentage and final grade of sixty-five or seventy-five.

2. I have accounts of dozens of ways for helping up the backward child. Bare mention can be made of only a few. Combination of backward pupils of a higher grade with bright pupils of the lower in the same room under a skilled teacher; ungraded rooms for backward children; the

practice teachers being used to help up the backward children; substitution for the so-called important subjects of some of the less essential ones; attendance in night schools; combination work in eighth grade and high school: these are examples of some of the methods used. The last-mentioned system is admirable where both schools are in the same building or near by. It relieves both the backward and the more capable pupils. One system of relief for the most capable permits the child to recite for a while in two grades in the same subject, and drop the lower one as soon as he is sure of doing the other.

3. The most unreasonable educational idea that has hypnotically spread from the colleges down to the first grade is the idea that a teacher with forty children can ask a question, call on a child to recite, grade him 0, 4, or 10; keep this up for five or ten months, then present an array of questions to be answered and graded in like manner, and by the final addition of these results determine the child's knowledge and fitness for promotion. Yet college professors and principals stand up and say that such a thing is a *necessary evil.* It is only the power of habit and the suggestion that such things are necessary that dominate our teachers and the community. Only a few days ago, I heard a principal say that he tried to get along without grades and *report cards* for three months, and found that all concerned preferred the old system. Can you educate a community or teachers out of a lifelong custom in three months? In that same city are schools as good as ever run in America in which such *necessary evils* have never existed.

Some months ago, thru the kindness of Dr. Clarke, I copied the examination manuscript of a boy's final test for promotion from the eighth grade. It was a paper in arithmetic. In some institutes where teachers were inclined to talk glibly about grading on what the paper is worth, and avoiding partiality, I gave the teachers this paper to grade. One hundred and fifty teachers gave grades ranging from 29 per cent to 88 per cent. But they immediately began to say that they would be obliged to know the *boy* first. I said, "Very well. But why do you then pretend that you base your percentage wholly on the paper?" They then named fourteen different things that should be considered in passing that boy. They were right and could have mentioned more. Again, what is poor work for one pupil may be excellent for another, and absolutely worthy of praise.

Whoever observed a growing, bubbling child knows that the expressive side of life never keeps up with the receptive side. The highest, truest, and deepest value of education can never be measured objectively. You feel it, or read it in the soul of the individual. Some things are qualitative and defy quantitative measurement. There is some truth in the paradox that the more we know about a thing the less able we are to define it. When a high-school boy I could define electricity better than Edison can today; and God knows that I could define Him better when a Sunday-school pupil than I can after years of study.

I repeat that this system of promotion on a fixed percentage supposed to represent so much knowledge in any given subject is the greatest piece of injustice ever invented by any educational system. It is a deception and a snare that prevents the operation of the common-sense of parents, pupils, and teachers. Who will stand up here and tell us the list of geographical facts a child must know in the fifth grade before he can do sixth-grade work?

4. The danger that threatens our country schools can be presented in a few words. Some states have developed the system by which the county superintendent or a state board prepares the questions that determine eighth-grade graduation. They are sent to the teachers in closed envelopes, to be given to the pupils, answered, and returned for correction. If such a vicious system was not found in my own state I would say what I think about it. During the whole year both the teacher and the pupils keep guessing what the questions may be. Proper interest, independence, and originality are crucified. How does the superintendent or this clairvoyant board know whether or not a child whom they have never seen should enter the high school?

The great nation of Italy fixes the grade percentage for passing in its national legislature, and they actually debate for days whether it should be 65, 70, or 80, and under what conditions, if any, a child should be excused from the final examination. China has had some such method for a thousand years.

5. Finally, *I must maintain that each child should, at all times, be at work in the grade and in the subjects that he can get the most out of without regard to what he knows or does not know about studies behind him, and without regard to how much more or less he knows than other pupils.* Is it not comical to talk about promoting a child "by courtesy" after he has been over the grade two or three times? Or of a "time-service promotion"?

Stephen Phillips describes "the Woman with a Dead Soul." Surely there must be some men with dead souls, or at least those whose only evidence of life is their desire to produce more souls as dead as themselves.

I further believe that the difference that separates educators is not at bottom so much a question of practical possibility as a question of the function of knowledge. I hold that outside of the immediate business or occupation of an individual the primary function of facts is to create the proper attitude toward the activities and problems of life, and to arouse interest and intellectual activity. Will it not be found that the old system of "know so much before promotion" exactly reversed this order? Under such an idea attention, interest, and intellectual activity existed for the accumulation of facts and knowledge.

Over-thoroness and accuracy have been made an immense burden without sufficient after-results in life to justify them. Intelligence, not memory, is the most precious thing in the universe; and in the language of

Principal Bishop, of Detroit, "You are doing a rank injustice if you make pupils mark time or keep them back in anything."

To allow the child to make the most of every moment of life in our public schools is not impossible. It is being done. When shall we learn to teach children and not subjects and textbooks? When shall we learn that in our effort to educate all the children we must deal with minds of all grades from the imbecile to the greatest geniuses that God ever turned loose on this earth, and that it is our business to provide for all of them? When shall we learn to look into the soul of the child and realize how far above our machinery that soul might soar if only we would not care more for the machinery than for the growing soul of the child?

D. SOME ADJUSTMENTS AND CHANGES IN THE COURSE OF STUDY AND SCHOOL ORGANIZATION SUGGESTED BY THE NEEDS AND THE CAPACITIES OF CHILDREN THAT VARY FROM THE STANDARDS SET FOR AVERAGE PUPILS

D. H. CHRISTENSEN, SUPERINTENDENT OF SCHOOLS, SALT LAKE CITY, UTAH

Dr. Chadsey has asked me to speak to you on "original and suggestive work in the Salt Lake City school system along the lines of what might be called the unusual." The rather pretentious topic assigned suggests the line of thought that I shall attempt to follow. While our movement is not original, it may have a few distinctive features. At any rate, it has been inaugurated to meet a condition and not to substantiate a theory.

In the discussion of this subject I shall for convenience divide it into three distinct sections, each one of which will deal with a department in which in our schools there is a well-defined, purposeful movement.

In the first section I shall consider the preparatory school which includes within its scope seventh, eighth, and ninth grades, and which may with propriety also encompass the tenth. It provides for some elective work, but not for the purpose of specialization.

The department has been established in recognition of the right of the child, even the "unusual" child, to receive from the school the kind of training best suited to his needs and capabilities. To secure harmonious relationship, the course of study must be adapted, not the child. Any change that the child undergoes must be growth and not adaptation to artificial standards.

In the second section the function of the ungraded room in serving the purposes of the child that is above or below the average in his class will be discussed. The department looks quite as much to the interests of the bright, precocious child as to the interests of the slow, backward child. It is not, however, intended for the mentally deficient or subnormal child. When discovered, he is transferred at once to the school for backward or

mentally deficient children, which is the third section for consideration. The school for these deficient children is centrally located, and they are transported to it at the expense of the Board of Education. It is used exclusively for this type and is, in part at least, a laboratory as well as a school. The head of this institution has been especially trained for his work, and his assistants are teachers selected because of their pronounced fitness for this class of work.

These three departments, it will be seen, are so varied in their combined scope as to provide a place for every child that does not belong to the large group of children whose interests are well guarded in the regular classroom.

THE PREPARATORY SCHOOL

It is manifest to all students of the school curriculum that the difficulty of meeting the needs of the individual child in class instruction increases as he moves upward in the grades. The nature of the prescribed work in primary grades and in the lower part of the grammar department is such as to appeal to the interests of practically every child and to meet his general requirements. His marked personal tendencies and aptitudes begin, however, to assert themselves as he passes thru fifth and sixth grades, which in so many respects represent a transition period in his life, and when he enters the seventh grade his natural bent is likely to be easily discerned. In some cases, perhaps the quality of his previous teaching may be a factor in predetermining this inclination, but most likely it is an expression of his own individuality developed under proper environment—the home and the school, and it may be that heredity has played its part. At any rate this condition arises, and who will say that the disinclination to attend school manifested by so many fifth- and sixth-grade boys, which all educators recognize and which has had voluminous discussion from many leaders in educational thought, is not due in part, at least, to the fact that the prescribed work in seventh and eighth grades, which under present conditions has so little regard for individual aptitudes and inclinations, is too restrictive in its scope and fails to appeal to them? Germany in her splendidly organized system has long since taken cognizance of individual proclivities and needs and has provided elective work with certain well-guarded restrictions as early as the third year. We cannot hope to begin so low in the grades, even if it were desirable, but the opportunity for some degree of choice should be given at the beginning of the seventh year. Every year it is necessary, in the interests of justice and fairness, to promote to the high school some pupils with a "minimum" mark in some subjects and a "condition" in others. The minimum subjects are supposed to be those for which the child has a minimum capacity and in which he cannot even with faithful and persistent effort reach the degree of attainment required for promotion. They are always, however, the ones for which he has a dislike and the ones in which little interest is aroused. The requirement that makes it compulsory for him to pursue these studies frequently results

in a permanent aversion to them, whereas a temporary discontinuance of them during a period of development of one or two years would likely bring the child to the place where he not only finds pleasure in pursuing them, but where he can do so at a much smaller expenditure of energy and with decidedly better returns than would formerly have been possible. I would not include in this class those branches the necessity of which as fundamentals all recognize. It is, however, in no way rare to find a bright and promising young girl forced to the point of failure and subjected to constant humiliation in her arithmetic, when her reading and language work give unmistakable evidence of an unusual intellect. The constant dread and the humiliation caused by her low standard of work in arithmetic not only rob her of the charm and delight of her school days, to which she is justly entitled, but her efficiency in the subjects in which her aptitudes are pronounced is perceptibly lessened. And then, too, it is not improbable that the constant worry consequent upon the doing of that work for which such a child has a natural aversion, an aversion which the best teacher cannot overcome, may have an adverse effect upon the health of the pupil, especially the girl who is just entering the adolescent period of life. Experience shows that many of such pupils during their seventh and eighth years—and here I have in mind particularly the girls—can distinguish themselves, and at the same time realize the maximum of pleasure in the effort, in the study of languages, particularly modern languages.

Our experience shows that these younger children acquire a vocabulary with surprising quickness and ease, they master idiomatic forms of expression readily, and they get a better foreign accent than do the older children. And above all else they find a pleasure in this work that more mature students seldom experience. They talk and read within the range of their acquisitions from the initial lesson. Grammatical forms are considered only as occasion arises for their use. Every new word or idiom learned has an immediate and, so far as possible, a constant application.

Unfortunately, the teaching of languages has by some been considered the exclusive function of high schools, when, in fact, the very nature of mind development makes an earlier period in life the more economical and effective time for their acquisition and mastery. The arithmetic work outlined in seventh and eighth grades, if it must come some time, can in some cases be done more effectively and in a shorter time later in school life, when more experience has been acquired and when a more mature development has taken place. Some parts of history, of civil government, and of grammar now included in the eighth grade might well be moved to the ninth grade, and some of the science and the English offered in the first year of high school could be at least as effectively taught in seventh and eighth grades. It is, then, a safe and conservative position to hold that the interests of the individual child require the overlapping of the course now outlined for the first year in high school and the work prescribed for the

upper part of the grammar department, and that the resultant must be an improvement in grammar-grade work, and an added efficiency in high-school work because of more effective instruction in the ninth grade (freshman high-school year) and consequently a better equipment for the second year of high school and the work that follows. A condition that would enhance the pleasures of school life and also likely prolong it, is not to be overlooked.

In reorganizing the remaining part of the high-school course it might be advisable to extend it to three and one-half or make it even as it now is—four years—but even that necessity would not invalidate the argument for the reorganization of the work of seventh, eighth, and ninth grades on the lines indicated.

THE UNGRADED CLASS

From the nature and scope of a course of study it is based almost entirely upon the need and the capacity of the average boy and girl, altho it must be admitted that the interests of the child above or below have not been entirely overlooked. But in school organization in the regular classroom an effort is made under conditions not altogether favorable to provide a condition that will permit the teacher to eliminate, in a measure at least, the exclusively group or class plan of instruction. This tendency finds expression in her conscious effort to adapt her instruction to individual needs in the course of the development of a subject. For the thoughtful, carefully prepared teacher, this task is not difficult when she is dealing with pupils whose rank and capacity place them within close range of the average child, whose group, by the way, consists of the major portion of the class. The difficulty, however, is greatly enhanced when some of the children, by reason of exceptional native ability or development or because of limited capacity, are much above or below the class standard. It will be noted that a period of development represented by one semester or a half-year separates each class from the one above and the one immediately below, and consequently the variations from class standards must be found in the intermediate ground or else they would naturally fall into another group. An effort to adapt the teaching to the needs of the few advanced children places the instruction beyond the full grasp of the major portion of the class and interest on their part will necessarily lag and the possibilities of the recitation must be greatly minimized, while the endeavor to move on the plane occupied by those low in the class rank will fail also to appeal to the majority and results are again unsatisfactory.

The pupils of a class a month or two after the beginning of the semester may then be resolved into three groups, at least two of which are found in most rooms:

1. The middle group including those that are of average rank and also the ones just below and immediately above the class standard. In this section we usually find from 60 to 90 per cent of the children. In fact, this group may include the whole room. For

reasons that are evident, it is not unusual for the entire 2B class to belong to this group during the first semester of the year.

2. Those farther below the class standard than the ones already listed. These children again fall naturally into two groups: (*a*) the older, more mature children who have been promoted because they have met the "time" requirement in the class below and have been regular in attendance and faithful in work, but whose capacity for development seems limited at present; and (*b*) the ones who have at least average ability but who are behind because of irregular attendance.

3. The pupils in advance of any in Group 1. It is not likely that Group 3 will have in its membership any below the average child of the class in mentality, because it is probable that if such slow child were above the average of his class in development and in his acquisitions he would be given the benefit of all reasonable doubt and be moved into the low or the average group of the next class, where he would find an environment better suited to his needs. In Group 3, however, may be found several subdivisions, especially in the latter part of the semester: (*a*) the precocious child who is in the habit of outstripping his classmates; (*b*) the retained child who has fallen behind because of irregularity or because of lack of effort, but who has resolved now to make a "special"; and (*c*) occasionally the once seemingly sluggish child whose powers, for reasons that baffle the teacher and parent alike, begin to unfold at an unusual rate of development.

A room in which all of the pupils at the beginning of the semester appeared to belong to Group 1, may soon, in spite of a conscious and well-directed effort on the part of the teacher, give evidence of a membership in the upper and the lower groups. Sometimes they seem to appear simultaneously, but generally, tho not necessarily always, the lower section shows itself first. This priority is due to the fact that the membership of the lower group, if it have any, is responsible to already existing, but not necessarily discernible, causes. Membership in the advanced group is usually determined by causes arising as the work progresses. A well-taught room is likely to develop an ever-increasing tendency toward the upper classification and a decreasing one toward the lower.

But the cause of this multiplicity of such classes in the modern graded school is of interest and value only as it aids the effort to meet and solve the problems that naturally arise. And the problem of most vital concern is that relating to the environment and instruction best suited to the needs of the children materially above or below the class standard. The so-called ungraded room into which such children are brought for individual instruction and study, for such time as their interests may require, has demonstrated its suitability over the regular classroom. Frequently after a few weeks' training some of such children advance until they meet satisfactorily the requirements of the next advanced class, while others move upward into the middle or normal group of their own. As they pass out, new candidates come to take their places, and thus the ungraded room has an ever-changing enrollment. The experiment of the ungraded room in this city has been tried enough to prove its place in our scheme of education, the aim of which is to reach and to serve the interests of the individual rather than the mass.

Reports of the work in several classes give some interesting points.

SUMNER SCHOOL

The ungraded room certainly does not lack variety in the class of pupils which gather within its walls. These pupils, I think, might be divided into three groups: (*a*) those who with a little help and guidance can easily do the work of the higher grade; (*b*) those who are behind their class on account of enforced absence; (*c*) those who find great difficulty in keeping up with their class on account of their inability to grasp one of the fundamental subjects.

The class first mentioned come to the ungraded room as permanent pupils for the space of time required for them to catch up to the higher class. They go to their own rooms for music, drawing, and spelling so that their day's work is not too monotonous. The remainder of the time is devoted to the fundamental subjects which they must know thoroly in order to do the work of the advanced class. In the higher grades these subjects are geography, grammar, and arithmetic; in the intermediate grades language takes the place of grammar, and in the primary grades reading is very important.

It is a great pleasure to work with these pupils, for they are very appreciative and so eager to get every point needed. That they are very anxious to show us that we made no mistake in choosing them for a special promotion is shown by the number of times they later call on the ungraded teacher with their monthly reports and their marks received in tests. The mid-year tests show that our pupils who made special promotions this year are very near the head of the lists.

The second class usually need but little attention given to them unless they have been absent for a very long time. These are not permanent pupils but come to the ungraded room for one or two periods during the day at such times as they can best afford to miss the work of their own rooms—usually at study periods. Glad of this opportunity of keeping up with their class, they willingly do at home the preparation work missed in their rooms. When they have mastered the important points needed they are again full-fledged pupils of their class.

The last class is really the one that does the hardest work, for these pupils are trying to master a subject which probably has been hard for them during their entire school life. The explanation given in class on a subject in arithmetic or grammar which the majority of the class readily grasp, they do not understand, and if given no extra attention go on to the next subject with only a hazy idea of the one just passed. In the ungraded room with fewer pupils they have the opportunity of personal attention and are very helpful to the teacher by frankly stating what they do not understand. In some ways this is the most discouraging part of the work, as there are some pupils, notwithstanding our best efforts, who will never be equal to the average pupil in all subjects. We have had five children in our school from one family not one of whom could get a good understanding of arithmetic. In such cases one's only consolation is that they might not do even so well without our help as they do with it.

In this latter class the ungraded teacher sometimes finds pupils doing unsatisfactory work in a subject on account of some error, the righting of which puts them among the best. A fourth-grade boy could never get a correct result in his multiplication problems altho he knew his tables perfectly. Watching him I found he added *one* every time he had a number left over to "carry" to the next product, whether the number that should have been added happened to be six or eight. He was delighted to find where he made his mistake and that removed all his difficulty in multiplication and long division. Another, learning long division, constantly made mistakes in his subtraction, altho he never made a mistake in a problem given as a subtraction problem. When asked about it, he said that he always thought one had to subtract in some different way when doing a problem in long division. These are but examples of the mistaken ideas that children get, and the ungraded teacher working with fewer pupils has a much better chance of finding these mistakes than the regular teacher with a larger number of pupils.

These pupils are anxious to get aid and often ask for extra work to take home that they may bring it back in the morning for correction.

Number of pupils given special promotion and now doing regular work in advanced class: 4A, 1; 5B, 2; 5A, 2; 6B, 3; 6A, 2; 7B, 6; total, 16. Many are leading their class.

Number of pupils who, because of special help, were able to be promoted at the close of the first semester: 3B, 1; 3A, 9; 4B, 24; 4A, 7; 5B, 16; 5A, 9; 6B, 11; 6A, 20; 7B, 9; 7A, 15; total, 121.

VIOLET WHITWORTH, *Teacher*

WHITTIER SCHOOL

I submit the following report of the results obtained in our ungraded room for the first semester:

The total number of pupils taught is 121. The number of pupils receiving help in the various grades and thereby succeeding in making regular promotion to the next grade is 60. And the number of pupils receiving special promotion is 39.

The object in our building during the first term was to meet the immediate need of the pupils, enabling them to do their regular work more intelligently and thereby to make their regular promotion more probable. Phonics, reading, spelling, and arithmetic were chiefly the subjects taught.

The work has reached pupils ranging from the 2A class to the 7B class.

The original plan, and the one pursued for the first term, was to give help to pupils in the various grades who were weak in one or perhaps two subjects. These pupils reported to the ungraded teacher at a time when their regular work would be the least affected by their absence from their room. The classes usually varied from one to five in number, and were made up of nearly all primary pupils. It was soon discovered that large classes defeated the very purpose of the work by reducing the personal contact of the teacher.

The second term the plan was materially changed. The morning session was wholly given over to grammar grades and the pupils remained all the forenoon. The pupils were those over-age and those who with special help were able to make a special promotion. Arithmetic, language, and reading were the subjects mainly taught. Undivided attention, application, and perfect deportment became the law accompanying all these special privileges.

The pupils who took the work, especially those who were given the opportunity of making special promotions, grasped the opportunity with great eagerness and continued thruout with the spirit of earnestness. Within a few days a new light of purpose and intent could be read on their faces; this was very marked in some cases.

As a result, personal endeavor and application, mental alertness, and a new interest in school have been awakened. Standards for promotion must be carefully maintained by both teacher and principal and inestimable good will result to the individual child enjoying these opportunities given by the ungraded room.

ERNEST E. H. SCOTT, *Principal*

EMERSON SCHOOL

In my report to you on our ungraded room, I wish to state that no teacher in our corps is rendering greater service to the system than is our ungraded teacher.

In almost every grade, we have pupils who have come to us from other systems and who are perhaps equal in strength to the others of the class, but owing to some differences in the work pursued in different systems, these pupils need individual help along certain lines in order that they may work well with the class.

Not infrequently along the line, we have pupils who from various causes are behind their grade in one subject. The ungraded room furnishes the remedy in these cases.

Another case in which the ungraded room has proved of great benefit is that of the apt pupil who, by means of this assistance, is enabled to shorten his course to the high school.

Then comes the timid child, the child of peculiar temperament or disposition, and the nervous child, all of whom have received help in the ungraded room.

Owing to our ungraded room, the number of retained pupils in our school has been reduced at least 50 per cent.

MARY DYSART, *Principal*

DEPARTMENT FOR BACKWARD CHILDREN

The sphere of the preparatory school and the ungraded room has now been considered. These departments provide a place for the normal child who shows an appreciable variance from the class standard set. Some of these pupils are above the average child of their grade and some below, but all of them are capable, at least so far as we can determine in advance of a careful individual study, of moving eventually into and thru the high school, altho those in the lower stratum will require more than the allotted time. But there is still another group—a small one, to be sure—one in which the members are deficient mentally, some bordering on idiocy. Unfortunately, but few states have made provision for them. They do not belong in the mental hospital, and justice forbids that they be excluded from the benefits of the public school, until such time at least as the state provides for their care and training. However, these children have no place in the regular classroom. All are a direct hindrance to the progress of the other children and a few are a menace to the welfare of the other pupils. For their own sake and for the sake of their associates they should be segregated from the other children and brought together in an environment especially suited to their own needs. The course of instruction for such children must be quite narrow in its scope, and it should aim largely to give motor and sensory training. Whether the lower types should be taught reading, even if possible, is open to grave doubt.

A very conservative estimate places the number of feeble-minded persons under 21 in Salt Lake City with a population of less than 100,000 at least as high as 70 and the number is likely nearer 200. In this estimate I am including only the marked types of feeble-mindedness. The proportion is equally as large in other parts of our country and statistics show that the percentage is much greater in some places. Including all children that show three years or more of retardation, which condition is made the basis of classification by some clinicians, the number is greatly increased. It is estimated that in England and Wales one out of every 250 persons is feeble-minded and that the proportion of insane is nearly as great. The percentage in America is in all probability as large. Dr. Fernald says: "There are at least 200,000 pronouncedly feeble-minded persons in the United States. Of these, 16,000 are inmates of almshouses, while only 18,000 are cared for in special institutions."

Our department for mentally deficient children does not aim permanently to care for the lower types of feeble-minded children. Thru the combined efforts of the expert in charge, the psychologist, and the school

physician, we hope to be able to secure sufficient reliable data in each case to enable us to classify the children into two general groups—the imbecile and the moron. It is not likely that the lowest type—the idiot—will reach the classroom.

But the type of feeble-minded children classed as imbeciles has no permanent place even in the special school. It is evident that most, if not all, of these are hopelessly deficient. Their proper place is manifestly in a state institution established, organized, and conducted for their type only. It is hoped that our special department may help to crystallize public sentiment to such extent that a state legislature in the very near future will take cognizance of this great social need, and permanently exclude the imbeciles from the unfortunate privilege now enjoyed of commingling indiscriminately with the community at large.

Accurate and reliable statistical information compiled by eminent authority proves most conclusively that the feeble-minded perpetuate their kind in alarmingly increasing numbers and thus add unnecessarily to the social problems and the criminal records of the future. It is evident to the careful student that heredity is chiefly responsible for the appalling increase of the feeble-minded, including the imbecile and the idiot. Unless precautionary measures be taken in the form of segregation and permanent exclusion, society will ere long have a greater burden in satisfactorily adjusting conditions than can easily or comfortably be borne.

In attempting to care for the lower type the public school cannot meet the needs of society. The state must receive him and care for him kindly and tenderly during his natural life. Any attempt to care for the feeble-minded in an institution that is organized and maintained as a hospital for the care and treatment of the insane is not likely to meet with unqualified success. Sentiment in matters affecting human happiness cannot be ignored, and frequently it proves callous to cold reason.

That segregation and permanent exclusion will prove to be for the common good will be, I believe, generally admitted. But several cases showing the penalty of neglect are here cited.

A feeble-minded girl of only thirteen, whose being encompasses the unbridled sensuality of the degenerate and the cunning of the savage, has already polluted the morals of at least twenty boys, most of whom might otherwise have passed thru the adolescent period of their lives without the surrender of their self-respect.

Another but several years older has bequeathed to society two illegitimate children, both of whom appear to have combined in their natures the traits that distinguish an idiotic mother and a criminal father.

Two parents are known to their charitable neighbors as "harmlessly silly" but "well meaning." The father does the commonest kind of menial labor and thus earns a meager livelihood for his family, while the mother discharges apparently acceptably her domestic duties in their modest home.

Several sons have resulted from this union. In each case nature has imposed a woeful restriction on the mental capacity. Years of painful plodding on the part of the child and even more painful effort and patient devotion on the part of the teacher have brought a reward that approximates the attainment of a normal child at the end of the first year. Disciplinary problems with each of these children, whose subverted natures have been ruled and guided by a type of intelligence that apparently can be responsive to that environment only which appeals to the lower instincts of human nature, have been both numerous and various. Their possible acquisitions measured in terms of school work seem to be circumscribed by a little less than the first two grades.

And then the expense! Reckoned in the least significant form—dollars and cents—it has exceeded several times that paid for equal advancement of a normal child. A greater cost has come in the lessened efficiency that results in a room where the subnormal child associates on terms of equality with the normal child. His presence cannot but have a depressing effect on the youthful aspirations of the other children. His moral standards—if he have any appreciable ones—are low and his presence contaminates. And then, after all, what has been gained? To the individual, it may sadly but truly be measured in negative terms. He may be, and in fact is likely to be, a less efficient member of society, because the school has attempted to do that which, from its very nature and purpose, it cannot do. And the school itself in its vain attempt to accomplish an impossible task has sustained a loss that cannot be designated as a negligible quantity.

The older of these boys are now approaching manhood, and unless their unfortunate tendencies fail to assert themselves in what seems to be the natural way, the greatest cost is yet to come.

With the commitment, then, of the imbecile and the idiot to a state institution, the department for backward children has a field rich in promise in the training of the moron, or higher type of feeble-minded child. The scheme of instruction or "treatment" must embody within its scope a careful and thoro individual study of the history of each case by the trained expert with a view to prescribing a line of instruction or treatment (possibly surgical) calculated to remove or at least to lessen the cause of the deficiency. In our experience some cases have been so completely "cured" as to justify transfers back to the regular classroom and others have had their capacity for development so greatly improved as to render the services of the special school quite effective.

In the consideration of environmental causes of some lighter types of mental deficiency, comparatively few in number and practically all responsive to the right kind of training, I am constrained to place an indictment against the school.

Is mental deficiency of the lesser type a by-product of the American school? To some degree at least, and in a very serious way, this seems to be true. First, in a negative way, as a kind of sin of omission, the schools

seem to be responsible, by failing to provide possible and practicable educative means readily at hand for the elimination and lessening of mental deficiency; and secondly, in a positive way, as a kind of sin of commission, the schools seem to be responsible, first by refusing in an aggressive way to permit the child to obtain at will the kind of training which might stimulate normal mental development, and, second, by forcing upon the child a kind of training which by its very nature is mentally stunting in its necessary effects.

The first phase of the problem here suggested has to do with the child who is of recognized normal mental capacity, but who is just enough below the average in mental ability to be habitually unsatisfactory in scholarship and occasionally failing to pass in his class or grade—altho at the same time he may show continual progress under regular class instruction, however slow or even sluggish it may be. Many of such children, who possess normal mental capacity but display subnormal mental ability, have been brought up to grade, to a standard of satisfactory scholarship, by means of individual instruction and attention.

The second phase of our proposed problem has to do with the child, not of recognized normal mental capacity, but with the child who is apparently subnormal in mental capacity—the child who is not only mentally deficient but who is seemingly mentally defective—the child who is practically at a standstill in school progress, and who is incapable of being restored to normality even by the individual instruction of the ungraded class.

This class of children may include some of the lower grades of the merely backward type, but, in the main, is made up of what is now coming to be termed the high-grade feeble-minded, or "moron" class of mentally deficient children. They are to be found stranded in the lower grades, anywhere from the first to the fourth grades; occasionally, because of size and age, they are permitted to be in the fifth grade; in rare instances for the same reason they are allowed to sit in the sixth grade.

Suppose that a child of normal mentality were retained in the kindergarten, year after year, from four or five years of age until twelve or fourteen years of age. What would, manifestly, be the result? Associating with little children, being treated as a little child, and consequently thinking, feeling, and acting as a little child during a period of several years, the pupil at first thought could scarcely be imagined as turning out in any other than one definite way; namely, stunted in general mental development. Should not his habits, thru years of repetition, become so crystallized into permanent traits of character as to present a case of extremely retarded development? Would not his reactions be the same as those of a typically high-grade feeble-minded child?

Upon further consideration, we might say that the result in our illustration would vary more or less according to the nature of the environmental

experiences of the child outside of his long detention in the kindergarten. But, supposing that these experiences were about the same as those of an ordinary kindergarten child—playing with children of kindergarten age, doing the things that kindergarten children do, and treated by adults as kindergarten children are treated—then could the outcome possibly be other than that indicated?

Have we not here an essentially homologous case as compared with actual cases of mentally deficient children who are for long periods detained in primary grades, with primary children, and under primary treatment, until they become of grammar-grade age and even of high-school age? Were children of normal mentality thus detained in primary grades, would not the necessary result be the same as in our illustration, or, if any difference, would it not be only quantitatively different and not qualitatively different? Would they not in their youth be childish, foolish, or children not grown up, as, indeed, the defective child of arrested mental development really is?

Is it not possible that many so-called defective children at the beginning of school are subnormal only in the fact that they have not the same degree of aptitude for scholastic learning as the ordinary child; or in other words, that they have not the native memory retentiveness for the symbols of language and number? And, furthermore, is it not possible that most of the other traits of mental defectiveness, such as poor judgment, lack of initiative, weak power of concentration, want of serious purpose, indifference toward the responsibilities of life, extreme credulity, simple and indiscriminate responsive affection, and other such qualities as are habitually displayed by the childish, the foolish, the feeble-minded—is it not possible that some of such traits are merely the outgrowth of their detention in the primary grades where the normal habits and attitudes of little children become crystallized into permanent traits of character?

Let us suppose that a child of normal mentality, beginning school at the ordinary age, were forced thru all the branches of the common-school curriculum in four years instead of the customary eight. What would, manifestly, be the result? Could it be anything else than a chaos of scholastic mental confusion, as would be expressed by the most absurd and pathetic mixtures of half-assimilated memory facts?

Is it not possible that some of the mentally defective children in our schools are also largely the outgrowth of an ill-adapted course of study thru which they are taken at a rate and in a manner totally out of harmony with the developing nature of the "unusual" child, or the average child? Let us keep in mind that the defective child is from the beginning in a class that is in scholastic advance of his own mental development; and thus in the regular classroom he continues during his entire school life to be improperly classified.

This discussion leads us no farther than to the somewhat reasonable

conclusion that some grades of mental deficiency may, in part at least, be the products of wrongly adjusted courses of instruction; i.e., courses wrongly adjusted for subnormal children.

Be it observed, however, that this reasonable possibility is not claimed for all cases of mental deficiency in the schools, nor is it claimed, at present, for any particular percentage of the subnormal children. On the contrary, it is readily to be admitted that there is unquestionable and abundant evidence that certain cases of mental defectiveness in the schools, particularly those bordering on imbecility, are the products of hereditary influences, or generative conditions, or traumatic injuries, or other causes entirely foreign to the school; and that the defectiveness thus caused continues incurable whether the child attends school or not.

In the fall of 1910 the head of the department for backward children in the Salt Lake City schools made a preliminary survey of conditions in the schools, spending two months in the work of examining all extreme or serious cases of pupils whose retardation had been observed by teachers and principals. As a result of this investigation, several notable things were discovered. One observation in particular, which seemed to be a distinct contribution to the problem of mental deficiency, was this rather surprising condition: Mental deficiency in any individual is evidently not integral; it is fractional. That is to say, contrary to the generally accepted theory, it was found that the mind is not defective as a unit in its sociological reactions; and that, on the contrary, the mind might be extremely defective in one field of sociological reactions and at the same time entirely normal in other large and complex fields of sociological reactions. For example, a child might be arrested in school progress and be extremely defective in scholastic ability, but, at the same time, such child might be normal or even supernormal in social development, or in vocational ability, or in ethical habits, or in religious sentiments.

From the observations made, it seems unfair to say that a child is mentally deficient, when in fact he is only scholastically deficient, and when he might have normal or even supernormal mentality in other fields of sociological adaptation.

Later in the school year 1910–11, a more intimate acquaintance with the subnormal children, thru personal contact with them, as a teacher of special classes, revealed a possible explanation as to why there appeared to be no uniform relation between development or retardation, scholastically, vocationally, socially, ethically, and religiously; and also revealed a possible explanation as to how the school might be the cause of mental deficiency in some cases and in other cases of subnormality have little or no injurious influence.

In his report to my office the head of this department says:

> It was observed that the most pronounced cases of mental defectiveness in the schools, and those whose deficiency came nearest to affectin the mind as a whole in all of its

psychological and sociological reactions were, as a strikingly general rule, those pupils who had been the longest in school, the most regular in attendance, the most industrious in their efforts to learn, and the most trustworthy in deportment. And, on the other hand, it was observed that the less pronounced cases of mental deficiency in the schools, i.e., those that, while being defective scholastically, came more nearly to being normal socially and vocationally, were those pupils who (1) had been very irregular in school attendance, or (2) had practical vocational experiences outside of school, or (3) had been incorrigible and mischievous while in school.

Thus it appeared that mental deficiency among subnormal children varied directly with the extent to which they came in contact with the school—mentality being inversely proportional to the environmental influence of the school—and the degree or extent to which the school seemed to retard mental development being measured by the ratio which the influence of the school bore to environmental influences outside of the school.

Personally, I have been unable yet to confirm these rather startling statements, but they are made by a careful, conservative, and capable department head.

In conclusion, I may with propriety say that school systems which still hold exclusively to the method of "mass" instruction, and provide no means for individual attention for the pupil of habitually unsatisfactory scholarship, are culpably responsible for an educational waste, because they fail to utilize the practical and inexpensive means readily at hand for the elimination, or partial elimination, of this milder type of mental deficiency.

In the process of adaptation necessary for effective teaching, the course of study must adjust itself to the child and not the child to the course of study.

E. A REORGANIZATION OF OUR SCHOOL SYSTEM

J. H. FRANCIS, SUPERINTENDENT OF SCHOOLS, LOS ANGELES, CAL.

In the interests of economy I am convinced that the best results may be obtained by a brief and direct description of what we are attempting to do in Los Angeles in the way of reorganizing our school system.

It is to be understood that the plan is not to be dubbed the Los Angeles Plan. I do not know how many other cities are attempting the same things and with what results. Recently someone mailed me a copy of an address by Edward Van Dyke Robinson, University of Minnesota, on the reorganization of the graded and high schools. I did not learn who this kindly disposed but unkind friend was. Since reading it I am certain that I shall practice plagiarism in this paper and upon future occasions. In fact I discover that either he or I have been at it in the past, for I might well content myself with calling your attention to his address which has been published in pamphlet form and which fully covers the points involved in this discussion.

OUR PLAN

The plan toward which we are working in our city, broadly speaking, follows:

1. One to two years in the kindergarten. Our state law compels the admittance of children to the kindergarten at a tender age, a prophecy of the days when the nursery shall become an integral part of the public-school system. This ofttimes results in a child's spending more than one year in the kindergarten, and in turn raises serious questions concerning kindergarten methods and content of work.

2. Six years in the elementary schools, assuming responsibility for the physical, mental, and spiritual development of the child between the ages of six and twelve. Because of economic and social conditions and principally because of the wicked folly of educators hiding behind the gray old fallacy of conservatism, this age limit too frequently reaches thirteen, fourteen, and even fifteen, thereby robbing the individual of the most sacred things in all the worlds that be—his hidden pride and confidence in the efficiency and power of his own personality. Fortunately the boy, for it usually is a boy, finds some sort of deviltry in which to give expression to this personality and thereby retain a portion of it which his good sense may later lead him to turn into legitimate channels.

3. Three years in the intermediate or junior high school, which, if the child has been fortunate, submissive, and not too individualistic, may be completed at the age of fifteen, covering nine years of school work.

4. Five years in the high school, which brings the student to the age of twenty, a good average age to begin the business of life despite the philosophy of my friend President Benton who holds we should remain infants until twenty-one years old.

SUPPLEMENTARY ORGANIZATIONS

This general outline of work designed to meet the needs of the largest number of American boys and girls is supplemented by:

1. The trade school, admitting pupils according to physical development irrespective of academic attainments.

2. Continuation schools open before and after school hours, offering work in manual subjects and optional with the pupil. This work we hope soon to enlarge and include in it music, art, mechanical drawing, and public speaking.

3. Vacation schools during the summer months, open in the forenoons and designed to conserve two purposes: (*a*) to occupy the time of younger children in music, folk dances, play, gardening, natural language work, drawing, and manual arts. Since this is development work, no effort has as yet been made to join it onto the regular system, which, if it ever was meant to be developmental, has degenerated into a scramble to furnish the child with an education by passing him from one grade to another until there are no more grades to conquer; (*b*) to furnish regular academic work for those who wish to make up previous failures or secure the coveted official certificate in subjects yet to be taken before they can be vouched for as

educated young men and women. Since this work is both uneducational and undevelopmental, it adjusts itself excellently to the regular scheme and has great advantages as a time-saver and hope-preserver. Many pupils return to school in the fall with new courage because they are up with their classes and can see the end ahead. These schools also keep pupils off the streets and out of more unprofitable occupations and save the city money in carrying them an unwarranted length of time in the school system.

4. Night schools for all grades and for all classes of people. But few phases of our school work have greater significance than this one. Purpose upon the part of the individual pupil, so lamentably lacking in the regular school, is a prominent characteristic here. If this nation has one prevalent danger it lies in the number of her school children passing thru school just to be passing thru, wholly lacking in intelligent or worthy purpose.

5. Special schools for the unsocialized individual who refuses to adjust himself to the regulations, formalities, and conventionalities of the schoolroom. These schools are the eddies into which the driftwood of the school system may gather and be treated until sufficiently seasoned to risk again in the educational current. They are necessary and strikingly convenient.

6. A liberal use of the ungraded room, which is but a tardy recognition of the fact that since some children will differ in essential particulars it is folly to subject them all to the same educational treatment and expect them to assimilate all its ingredients with equal facility and profit.

7. The social center, not yet a year old but a very promising educational youngster.

SIMILARITY TO THE GERMAN PLAN

Similarity of this to the German plan is to be frankly conceded, which leaves a beautiful opening for the American patriot to orate on the virtues of the American and the defects of the German system. The German system, however, should not be adopted for our needs but adapted to them. There must remain one fundamental, vital difference between the present German and the future American plan. The latter must have no blind alleys, and her educational cross-roads joining the main highways must be kept in as good condition as the highways themselves. This becomes possible with the assumption that the coming generation of American educators will cease to be frightened at the imaginary chasms between these highways, and discover that a good traveler who has been moving on his own steam upon one will need fear no great hardships or difficulty in traveling on any other. This also suggests the other significant difference—American vocational schools can no more afford to sacrifice the so-called liberal studies than can academic schools afford to eliminate constructive and applied work.

THE INTERMEDIATE OR JUNIOR HIGH SCHOOL

According to the topic printed on the program this paper should concern itself principally with that part of the school system covering the work

of the seventh, eighth, and ninth grades done in the organization known as intermediate or junior high school. At present we have five such schools in Los Angeles, enrolling approximately three thousand pupils. We expect to increase this number until all the pupils of these grades shall be accommodated in schools of this character. Four of our intermediate schools are five months old and one can boast a year's experience. Three uniform courses are offered in each of them: a general course, a commercial course, and an elementary industrial course. These courses are planned with two classes of pupils in mind: (*a*) those intending to enter the high school and (*b*) those electing to leave school at the end of the ninth year. Both are given full tenth-year standing in the high school.

In attempting to plan work for these we also concern ourselves with the individual independent of what he intends to do or where to go. This, of course, is the age-old problem and the fundamentally important one, likewise the one most poorly solved.

In the seventh year one option and in the eighth and ninth years two options are allowed out of a group of six or seven studies.

WHAT IT WILL ACCOMPLISH

For the pupil going thru the intermediate school we expect to accomplish the following:

1. An ability upon his part to do some thinking that may be more or less his own, probably less. We concede that this is ambitious and may have to be content with limited results. Slight results, however, will be refreshing and give hope. Doubtless American boys surpass those of all other civilized countries in their willingness and ability to do things and in their unwillingness and incapacity to think logically, consecutively, and deeply. In this latter the American boy is surpassed, if at all, only by the American girl, with honors close. The cause is easy to discover. The system and not the child is at fault. We have been asking the pupil to recite what he has just read from the pages of a textbook that never should have been published and never would have been save for the money there is in it. The lesson begins on page ten and ends on page twelve and except for these pages it begins nowhere and ends at the same place. The pupil's passing thru the grade rather than passing the grade thru him has been emphasized until it has become the main problem. Since this is accomplished thru satisfactory recitations, the stereotyped, formal, and deadening recitation in turn has become the important activity of the average schoolroom. Real thinking is of minor consideration. The time, energy, and life wasted in recitations in the American schoolroom would serve as the comedy of the ages were it not the tragedy.

It might be legitimately asked how the intermediate school can improve upon the grade schools in inducing pupils to think. The reply must be qualified, but a specialist who is supposed to think more deeply on his

particular subject must be conceded to be better prepared to lead his pupils to do the same.

2. To accustom the pupil to departmental work and hence to prepare him for high-school methods. The educational death-rate in our ninth year or first year of high school is alarming. This again is easily explained. The pupil who has enjoyed the maternal care of a conscientious teacher who knows his strong and weak points and is equally well known by him enters a great high school and becomes lost. There is no one to look after him to tell him when to get his lessons and how to conduct himself. The change is too sudden and too violent. He fails, becomes discouraged, and drops out. Our experiment so far has resulted in 18 per cent of ninth-year intermediate pupils failing in one or more subjects as against 42 per cent in the same grade of our high school.

The pupil in becoming accustomed to, also enjoys the advantages of, departmental work. These are incomparably great compared with the old plan of one teacher for the entire curriculum. The mother-teacher idea belongs to the pre-adolescent child. Adolescent boys and girls are entitled to learn from those who are masters of what they teach. This is impossible when one person is required to teach arithmetic, geography, history, literature, language, science, penmanship, music, art, ethics, hygiene, agriculture, needle-work, etc., the *et cetera* to include those subjects which may have escaped my memory. Specialists and specialization offer serious problems in education but they are not hopeless ones, as are those presented by the unprepared teacher. Teachers are not at fault. They are the victims of a system that demands the impossible of them. Nor can departmental work be brought to its highest efficiency under regular grade-school conditions. On account of lack of numbers of equal grade, diversity of interests running thru so many grades, intricacies of programs, and attitude of principals and teachers, departmental work in the grade schools meets with unnecessary difficulties.

3. The intermediate school conserves the time and interest of the pupil. Six years is sufficiently long for the mastery of the arts. The last two years of grade-school work occupies itself naturally with repetition. An attempt has been made to enrich these years by the introduction of new material. The result has been an educational hash. The number of young people lost to the schools, thru lack of interest in their work caused by repetition or by work superficially done, is a startling commentary on the wisdom of school men and women. The adolescent youth begins to inquire, reason, and judge, and he must have material upon which these qualities of mind may feed.

Of all the inexcusable follies to be chalked against us as teachers, possibly that of compelling the child to repeat the work of an entire grade because of failure in one or more subjects is the most glaring. It is possible to avoid this in the grade schools, but inconvenient. This inconvenience

is the main cause for the practice, altho it is not conceded to be so. In the intermediate school the practice disappears naturally and necessarily.

I do not hesitate in the belief that under a well-organized system of intermediate schools children will finish the ninth grade at least a year ahead in development, possession of knowledge, and the power to acquire it, of the ninth-year pupil under the present plan.

4. The intermediate school offers to the pupil an equipment and organization not possible under the grade plan, such as science laboratories, well-equipped shops, art and mechanical drawing-rooms, cooking- and sewing-rooms, commercial rooms, music halls, gymnasiums, auditoriums, etc.

5. These schools should develop in the individual social- and self-responsibility at an age when responsibility to society and to self become most important. The theory that the older and stronger pupil of the school should look after the interests of the younger and weaker one is beautiful. It has one serious defect: it does not work. The facts are that the farther our school children progress in the system the less they seem disposed to assume any responsibilities. We are sending out armies of boys and girls, men and women, possessed of the spirit of getting what they can and giving as little as possible in return, the spirit that in social, political, and economic life is a menace to the nation.

Student-government and other student activities should be organized in the intermediate school to offer opportunity and encouragement for the giving of self to a legitimate and worthy cause. Our young people must be taught that it is more blessed to give than to receive.

Too much is being attempted for the child, too little by him. Too many safeguards and restraints, too much protection, advice, and guidance will not result in a race of men and women with the mettle of our fathers and mothers. They developed the real stuff within them thru early sharing the responsibilities of life and playing their part in the game. Somewhere below the university and below the high school we must lead the individual to recognize the fact that the world owes him just what he is worth to the world and he owes himself just what he is worth to himself. This belongs to the period of adolescence, but is very difficult to develop effectually in a school where the pre-adolescent child greatly outnumbers the adolescent. Our grade schools are usually dominated by the atmosphere of the child-world or the world of men and women. It is a rare corps of teachers with a rare principal who succeed in harmoniously blending the two worlds. Much of the lack of interest in, and the dissatisfaction with, his school and most of the bluff and bluster of the average eighth-grade boy are due to his environment which is not in harmony with his nature. The average eighth-grade girl is equally, tho perhaps differently, affected.

6. The intermediate school offers opportunity to secure men teachers for its pupils. As this convention is composed largely of men I leave it to

you to pass upon the merits of the proposition. It should be noted, however, that the plan does not exclude women teachers, and while teaching is not a sex problem it will be conceded that so long as men and women differ widely in their experiences the adolescent mind should come in contact with both the masculine and feminine viewpoint. This is necessary to insure the mental balance of the individual pupil.

7. The intermediate school concerns itself with the child not going to high school. The American high school has grown within the last decade to become the greatest educational institution in the world, largely because it has been compelled to concern itself with the interests of the pupil not going to college. He was the more important because there were more of him. The intermediate school in the next decade will be doing for the boy and girl not going to high school what the high school is now doing for the boy and girl not going to college. It will then surpass the high school in importance because of numbers benefited. The high school in its efforts to care for the boy and girl not going to college has increased the number of college students many fold. So will the intermediate school increase the high-school enrollment. The colleges are coming to recognize that the high-school pupil who is prepared well to leave school at the end of his course is well prepared to continue work in college; so will the high schools discover that the intermediate pupil who has given the most thought to, and taken the greatest interest in, his work is best prepared to meet the requirements of the high school.

The inquiry will probably be raised here of what can be done for the child in the intermediate school to prepare him for life. The reply is anything the system and teacher are prepared to do. The limitations are not in the pupil but in systems and teachers. If the psychologist challenges the statement, I would call his attention to the growth of education during the last quarter of a century, in which time we have witnessed the high schools advancing far beyond what the colleges were then doing and the colleges and universities occupying fields then unthought of. Even the grade schools, in music and art, have far surpassed the dreams of the university enthusiast a quarter of a century old, if there were any at that time. To say that we have reached the limit of the child's capacity is to indulge in academic twaddle. We may be reaching the end of his capacity, but which end?

8. The intermediate school offers opportunities for the child to find himself. Possibly no greater service can be rendered to him by the public schools. Certain it is that too few do find themselves in their school days and too many of these do so too late to take advantage of all or much the schools have to offer them. The belief that young people are not prepared to decide upon a vocation until they have finished college is dangerous and wasteful. The young people of this country must know earlier what they are to do in life and prepare to do it. Whether they afterward do it or not

is of minor importance compared with what they become in preparing to do it.

A system of education that is worthy of the time, effort, and money spent on the American schools should be one of widest possible opportunities in which young people may discover their best qualities and powers. It should also induce them to develop and exercise these powers in the service of mankind.

Vocational advisers may be helpful and even necessary but vocational subjects properly presented offer a safer guide to young people in making their choice. These can be given with but limited success in the grade school; the intermediate schools furnish excellent opportunities for their introduction.

THE INTERMEDIATE VERSUS THE SIX-YEAR HIGH SCHOOL

The intermediate has distinct advantages over the six-year high school which proposes to admit pupils in the seventh year and carry them thru the twelfth. In some of the smaller districts where they are erecting expensive high-school buildings to accommodate a small number of high-school pupils it would seem best to organize the system on the six-year high-school plan. In the larger cities, however, where high schools are usually crowded and almost uniformly too large in numbers, the intermediate-school plan is better. The transition from grade to departmental work should be gradual. This is one of the important problems of the intermediate school, where it can be better worked out than in the large high school with other problems of its own. High schools have not solved the transition problem between the eighth and ninth years. To make the break as violent between the sixth and seventh as it now is in the ninth year would be adding to our difficulties.

Seventh- and eighth-grade pupils are too old to associate in school with first- and second-year children but too young and inexperienced to work on an equal footing with eleventh- and twelfth-year pupils.

In most states children are compelled by law to remain in school between the ages of six and fifteen inclusive. A school, therefore, that completes its work with the child at the age of fifteen is a logical unit in the public-school system. Its business will consist in the solution of problems raised by pupils of these grades and this it can do better than the large high school which is more interested in other problems.

The item of transportation to high-school centers and the unnecessary dangers to which young people would be subjected in traversing our large cities argues strongly for the organization of intermediate schools within walking distance of practically all its pupils.

To include the ninth year in the intermediate school insures an additional year's schooling to a large percentage of public-school children. Having finished eight years of work, they will remain the additional year

to graduate with their classes and complete the courses they have undertaken. If they were admitted to the high school in the seventh grade the temptations to drop out of school earlier would be stronger.

The three divisions of the school system are physiologically, psychologically, sociologically, and logically correct. The present organization of eight years in the grades and four years in the high school violates the principles of all these sciences.

THE INTERMEDIATE AND EXTENDED HIGH SCHOOL

The intermediate school assumes its true significance only when considered in connection with the extended high school. With but six years given to the mastery of the arts and the remaining eight years to the development of the individual and his preparation either for junior college work or for a definite vocation in life, our system of education opens up tremendous opportunities and possibilities for the school children of the country and will make returns for the nation out of all proportion to the additional cost necessary to operate it.

TOPIC: THE DETERMINING OF SCHOOL EFFICIENCY

A. THE VALUE OF THE EDUCATIONAL COMMISSION IN DETERMINING THE EFFICIENCY OF A CITY SCHOOL SYSTEM

CALVIN N. KENDALL, COMMISSIONER OF EDUCATION FOR NEW JERSEY, TRENTON, N. J.

The attempt to determine school efficiency by means of commission investigation is the most recent method of answering two questions: What return is the community getting from its investment in the schools? How can the investment be made to yield greater returns?

The movement to test efficiency in this way has by no means become widespread. So far as I know, the schools of not to exceed half a dozen municipalities have been examined and reported upon. The investigations have been carried on within the past eighteen months.

The data are consequently both insufficient in amount and too recently gathered to afford sufficient information upon which to base definite conclusions as to the real or ultimate value of such investigations and reports. Nevertheless, a consideration of the value of commission reports is worth the attention of this department, even tho the discussion must be largely academic or theoretical, rather than pointing to what has already been accomplished. A consideration is worth while because signs are not wanting that such investigations will gradually become more common. What are these signs?

First, public interest in education is growing, as evidenced by the increased amount of public discussion concerning it. A generation, itself

educated in the schools, is bound to ask questions about the schools of the present day. It would indeed be a discouraging comment upon the schools of the past if it were not so.

Second, there is increased confidence in the possibilities of the schools, as Dr. Eliot has pointed out. "Democracy is looking more and more to the schools to make things go well in this country."

Third, public education is becoming slowly but surely a more serious business. Efficiency tests are likely to be demanded at a time when "efficiency" seems to be the popular catchword. This is an age, too, of increasing publicity in regard to all public affairs. The educational statistician is abroad. His figures throw light upon certain phases of efficiency, and are of use so far as they reveal measurable conditions. In this practical age there is sure to be a search for tangible results of educational processes. But is it too much to affirm that there must remain some vagueness and uncertainty in ascertaining the results of education? In the realm of the intellectual and spiritual, with which education has so much to do, there is a very large residuum, the value of which cannot be measured by figures and tables.

As a result of my observation of teachers in action in many schools, I am skeptical of finding, by any known test or commission report, a definite measure of the value of much of the teacher's real work. The factory is one human institution, the school is another. The value of the output of one may be determined in the office, but the whole measure of the other institution, the school, cannot be so measured.

With this qualification, the educational commission affords a means, available to every community of considerable size, of reaching conclusions regarding the efficiency of its schools; measured, first, by what figures and tables may show; second, by the extent the administrative methods, the organization, the course of study, the schoolhouses and their equipment, are in accord with what has come to be widely accepted as the standard for American schools, so far as there is a standard; third, by observation of the teaching, and, speaking somewhat vaguely but nevertheless confidently, the general spirit of the schools.

I am of the opinion that school superintendents should not look with too great suspicion upon this movement, or regard it as another means of making their work more hazardous than it is. Broadly viewed, the educational commission should not be regarded as a club to be wielded in the hands of the enemies which every capable superintendent sooner or later makes.

Investigation may be of constructive value in two ways. In the first place, it may reveal to the school board and to the public the strong points of the schools—features which are locally unknown or unappreciated. In the second place, it may point out the desirability of certain improvements or changes, which the superintendent has perhaps urged in vain upon

callous boards or an indifferent public. For example of the first, in Baltimore the Commission last spring found much to commend in the well worked-out and extensive plan of grouping in special classes or schools particularly able pupils. For example of the second, the Baltimore Commission reinforced the recommendations of the superintendent, that the schools needed additional supervisory officers.

In East Orange the report pointed out to the community that the grammar-grade children are excellent spellers. It also pointed out that "there should be a more thoro systematization of the work of the Board of Education, the superintendent of schools, and the other officers of the system, such as shall specify the functions and responsibilities of each," a matter which the superintendent had before strongly advocated.

The report of the commission may be valuable, in the third place, by pointing out the need of more money for the schools. The Baltimore report showed that of the cities of its class in population, the expense for schools was less in Baltimore than in the other cities. The Montclair report stated that it is false economy to save money temporarily by doing without satisfactory playgrounds. "Ultimately," the report goes on to say, "the city will find it necessary to provide them at a greater cost; and meanwhile the children must go without the really indispensable education playgrounds afford." The Boise report showed that the term of service of teachers in that city was altogether too short, and this due to inadequate salaries.

I am of the opinion that the investigation and report should not overlook a consideration of the influence of any general political agencies that may be at work in the community to undermine, impair, or overthrow sound educational policies for the development of the schools. These agencies may be found among members of school boards, or among politicians outside, or even, unfortunately, among a minority of the teachers themselves. The existence of these agencies may be unsuspected by the community. If they exist, the commission, from its own independent position, might well give voice to its convictions on the subject.

The activities of a system of schools are now so varied, so complex, so extensive, that some of these, in the best schools, are imperfectly carried on. This same imperfection is true of railroads, manufacturing establishments, department stores, scientific farming, and every organized human endeavor. It is true of the best of these, and managers are on the lookout for improved methods.

So, likewise, it should be with the schools. In fact, an increasing number of superintendents are studying the problem of increased efficiency.

The commission, from its independent study of conditions with an unprejudiced point of view, may be able to enlarge the vision, clarify the views, and recast the opinions of superintendents in respect to some of the many-sided activities of his work.

In my judgment, the commission should not neglect to touch upon the most important factors which contribute both to school efficiency and to school inefficiency. The list of these factors is a long one—the dangerous conditions of buildings in respect to fire, pointed out in several reports of commissions already made; the inadequacy of playground space, also pointed out in more than one report.

Other matters to which attention has been called in reports are as follows: imperfect light; slovenly school buildings; absence of constructive, inspiring supervision; failure in the rules to give the superintendent adequate power in the appointment of teachers; low salaries in comparison with other cities; far too numerous changes in the teaching corps; the retardation of pupils; the overcrowding of rooms, usually in the primary rooms, where the children are docile enough to stand it; lack of professional attitude on the part of teachers; the lack of provision for backward or subnormal children by means of special classes; measures to promote health; provision for industrial training; the adaptation of the life of primary schools to child life; the quality of teaching, so far as there may have been opportunity to observe it; the spirit of the teachers as affected by the quality of the supervision; freedom in the interpretation of the course of study; the interference of board members in the work of teachers, in the promotion of teachers, in the general morale of the teaching corps; the amount of home study; the relations of parents to the schools; the equipment of schools, not overlooking the seating; the abuse of the examination system; the course of study.

It is conceivable that the extent of a comprehensive survey may reveal to the board, for the first time, the nature and extent of a modern school system, and may afford to the public a glimmer of the many-sidedness of the work of a superintendent.

The report should commend the achievements of the schools. The public needs education in this direction, as well as in the direction of still greater achievement in the future.

The following is taken from the Baltimore report:

> The net result of our inquiry into the system of education is an opinion favorable to that system. While we find much to criticize adversely, we have taken into account the historical development of the system and its very moderate cost at the present time. In view of these considerations, we are justified in rendering a report which in its main outlines is positively favorable. With reference to any school system the important thing is not so much the question, What is its present status? as that other question, Is it moving in the right direction? It is clear to us that, under the charter of 1898, in spite of certain particulars in which changes are still called for, the general movement in Baltimore has been unmistakably in the direction of improvement. We have, in fact, been repeatedly struck with admiration for progress which has been made in the face of more than ordinary difficulties.

While the report in certain particulars may reflect upon the judgment of the superintendent, or upon some policy of his, yet a strong man need

not fear this. The day is past when any educational system is regarded as perfection, or any man or set of men as having said the last word in education.

Much depends upon the manner in which the commission is appointed, or rather at whose instance it is appointed. The superintendent may indeed take the initiative in securing the appointment of the commission. Obviously it is much the wiser course for him to take the initiative than to have it taken by hostile influences in the community. The former course was taken in one of the small cities of the country, where the superintendent felt that certain conditions might be made better, but he needed the support and testimony of outsiders. He had the confidence of the leading commercial organization of the city, as well as that of the Board of Education. The commercial organization was induced to finance the expense, and the board agreed to co-operate. With this unusual combination of superintendent, school board, and commercial club all working in harmony, the subsequent report was received with much interest and confidence. The community was unusually enterprising. The commercial club was far-sighted enough to realize the value of good schools in making the city more attractive as a place of residence. The result was that all the recommendations made in the report were adopted by the school board, and the superintendent, strong from the outset, became stronger still because he had initiated a plan to bring in outside views or counsel.

Much depends, too, upon the character of the man or men on the commission. Obviously the commission should not from the outset be antagonistic toward the superintendent. On the contrary, it should be sympathetic toward the complex work of the superintendent.

What have been the tangible results of commission reports cannot be affirmed, because, as stated earlier, there is too little evidence yet available. In Baltimore conditions have been such as to preclude a serious official consideration of the main features of the report. The neglect of the report thus far in that city should not be taken as evidence that reports elsewhere would be treated in the same way. In Boise, on the other hand, all the recommendations were acted upon favorably within a brief period after the report was submitted. Conditions in the two cities are very different. One of these is the fact that one city is large and the other small. A large city school system is likely to move more slowly than a small one, even if all other conditions are the same.

How to turn an expert interpretation over into an unquestioned acceptance by public opinion is not an easy matter. Most of us know that reforms in educational practice do not go on by leaps and bounds, but by slow degrees. The suggestion is offered that after a report is submitted, it would be advisable for the commission to meet, in a series of conferences, the school board, the administrative officers of the system, the principals, the commercial organization, newspaper editors, and other leaders who

have the power to shape public opinion and to get action. People who are singularly averse to reading reports may be interested in a public discussion conducted by the makers of such reports. The report must be got by some means into the public consciousness after its submission. It should not be pigeon-holed.

Even tho there be no visible results of its activities, the work of the commission nevertheless may be positive and definite. It may be serviceable to other and even distant communities. It may confirm the educational convictions and revise the standards of the more thoughtful among the teaching body. Such a result alone is worth while. It is too much to expect that such reports will all at once recast public opinion or immediately revolutionize the action of school officials, but unless educational conditions in a city are unusual, the report of a disinterested, capable commission will be valuable in shaping educational policies.

B. THE RELATION OF AN URBAN COMMUNITY TO ITS PUBLIC-SCHOOL SYSTEM

MARTIN G. BRUMBAUGH, SUPERINTENDENT OF SCHOOLS, PHILADELPHIA, PA.

Public education is the state's effort to promote and to provide efficient citizenship. It best accomplishes this necessary result by training each separate individual in its citizenry to co-operate most freely and fully with all other individuals. The state, for the ends of democracy, commits to the school the solemn and sacred service of fitting the child to do his part for life in that great social and civic activity which we usually think of as government in its broad sense. The individual can play his part in this organized game of life only so far as he is given such knowledge of the game as to enable him to play it understandingly and cordially. If to this is added the fact that the individual is by birth a member of the committee on rules, intrusted with the power to amend the rules of the game from time to time, it is manifest that the fate of this thing we call government is conditioned upon a proper preparation of each member of it to do his part in such manner as to promote the welfare of the entire group.

The essence of school training is co-operative and not competitive. It consists in giving to each member of the social group the common elements of a universally necessary education. These tools of democracy are the stable elements that must always lie at the heart of a school curriculum. The possession of these is essential to the life of democracy. The imparting of these is the business of the school.

So long as the school is the only social agency broadly at work in a community and the life outlook of its pupils is only to a career of individual industry, one has a rural situation. Education here is a relatively simple process. But when the school is set in a great urban community in which all activities of the individual are trenched upon by a multiform and highly

organized economic situation, education becomes a vastly more complex process.

The school has definite and important obligations to an urban community. These I do not propose to discuss. But what is the relation of a great populous community to this institution set to fit its individuals for wisest relations to society? The function of the school is limited in scope by legislative enactment. In this restricted scope it is further limited by the financial support the community provides. Within the bounds of statutory law and local taxation, the school, as an agency of the state, must carve its career and define its function.

These limitations should always be considered by citizens, who in their zeal to broaden, and, as they believe, enrich the work of the school, insist upon incorporating into the school's activities certain reforms that are either legally or financially impossible.

These limits upon the school tend to make it conservative. Private initiative frequently outruns public policy and the school is made to appear as hostile to the progressive spirit of many good citizens. This situation is always possible in a great city, with its many divergent educational ideals and with its non-homogeneous communities. It is, however, wiser and better to be held by some as conservative than to be held by any considerable number in the urban group as extravagant and visionary. The issues of public education are too momentous to allow of radical experimentation. What then is the outlook?

The school plant, its physical appointments, belongs to the people, and should be freely used by the people for all sorts of educational activities that are not yet demonstrably within the range of the school. We are passing rapidly from the old and narrow idea that the school building is merely a place to educate children of a certain age in a defined way, to an understanding of the fact that schoolhouses are the people's forum—to be used by them for every wholesome intellectual, social, recreational, and moral purpose that makes for the common good. We are coming rapidly to the opinion that the school building should be open day and night for every legitimate use that the community as a whole can vision.

This newer concept of the use of the school plant in an urban community opens the way for substantially unlimited experimentation. There are many unsettled problems in the educational policy of a social democracy. Wise and public-spirited citizens, quite apart from the accepted procedure of the schools, may find in this newer use of school property a legitimate sphere of exploitation. This enterprise may take the form of public discussion or the vastly more promising form of public demonstration of those things which once proven to be educationally good may find permanent place in the scope of the school's legal and financial possibilities. Private initiative is thus given a definite relation to constructive educational procedure. It is saved the unfortunate relation of destructive criticism—a

relation that in general disturbs and does not promote the stable educational procedure of a great city.

In the immediate past or in the present private initiative has been most helpful in promoting in an intelligent way, and for the most part in public-school buildings, the movement to enlarge and to enrich the entire school activity of a city. And all this, be it remembered, may be done with the full sympathy and co-operation of those who by law are charged with the administration of the schools. It enables the citizen with a great thought to carry it to a successful demonstration and to see it finally made an integral part of the training given the children of the city. He has some incentive to devote time and money to his enterprise when the community regards with expectancy the issue of his enterprise. He has relieved the schools of an expensive experiment, promoted their effectiveness, and achieved a notable good.

On the intellectual side, private initiative can promote such important agencies as:

Home and school associations.
Free lectures.
Studies of racial groups.
High schools on a modern basis.
Schools for the mentally defective.
Schools for the mentally retarded.
Other special classes.
School gardens.
Vacation schools.
Trade schools and continuation schools.
Circulating libraries for pupils and parents.
Industrial education in the elementary grades.
Decoration of school buildings.

On the physical side it can promote such agencies as:

Medical inspection.
School nurses.
Special treatment of defective vision.
School visitors.
Zones of silence.
Orthopædic clinics.
Clinical care of children's teeth.
Mothers' alliances for the care of babies.
Treatment of the deaf and blind.
Outdoor schools for pupils suffering from incipient tuberculosis.

On the social side it can promote such agencies as:

Playgrounds.
Equipment of school yards.
Social centers.
Employment agencies for pupils leaving school.
Recreation centers.
Public baths.
Kindergartens.
Play carnivals.

On the moral side it can promote such agencies as:

Savings banks.
Parental schools.
Special classes for unusual girls.
Organized moral training.
Simple housekeeping.
Such other forms of volitional education as will result in securing to every child habits of right action, as surely as he forms habits of right thought.

The real friend of the state aims to confirm and extend these stable institutions of society, the church, the home, and the school. He is ready and alert to give time and money to the promotion of all legitimate progress in the social order. He is willing and anxious to try out in experimental form whatever bears the promise of help to childhood. He is always co-operative and constructive, and never cynical and destructive. He sends, half in hope, half in fear, the dove across the mist-hung waters, glad if on its return it bears the promise of better laws and loftier ideals for the training of citizens for the republic of men and for the Kingdom of God.

C. HOW MAY A COMMUNITY LEARN ITS UNMET SCHOOL NEEDS?

WILLIAM H. ALLEN, DIRECTOR OF BUREAU OF MUNICIPAL RESEARCH, AND NATIONAL TRAINING SCHOOL FOR PUBLIC SERVICE, NEW YORK, N.Y.

By six lines of attack must a community learn its unmet school needs:

By democratizing the purpose of the schools.

By demanding that the public be continuously informed regarding school work.

By making it easy for newspapers to report what the schools do and need.

By denying that the schools are better than the health department, police department, tax assessor, or the politics with which school children must learn to cope. Schools are weakened, not helped, by being separated from the main currents of community life and by being protected against problems which play upon and educate the child before going to school and after its few short years at school.

By encouraging school teachers, principals, superintendents, and commissioners to tell currently what they want, what they need, and what they dislike, and where they fail. This means adequate comparative statements, first by supervisory officers for schools within each community, and then by county and state superintendents, by the United States commissioner of education, and by national comparing agencies such as the Russell Sage Foundation. Having given up the fiction that there is something sacred about school curriculum, school policy, or school men, there will at once become available a vast amount of testimony, interest, and constructive suggestion on the part of those who best see the unmet school needs, namely, the men and women who are meeting the children and the problems of curriculum, management, and health. This will follow, not precede, the establishment of definite and continuous tests for the efficiency of school trustees and of the mayors who appoint them or the publics which elect them.

By making individuals so proud of their schools, and so interested in school problems that they will paraphrase Louis the Great and feel and say: "*L'Ecole c'est moi!*"

No community will be able to see clearly its educational needs not met which has not the habit of studying and challenging frankly the educational

needs which it thinks it is meeting and the methods of meeting those needs. The first requirement is, therefore, a system of school records and reports which will begin at the first day of the school year and record important facts regarding pupil, teacher, principal, superintendent, and system. But because no community lives by or for itself alone, every community will be helped in studying its own needs if it may see the experience of other communities. To help itself, therefore, every city should adopt the uniform records and reports which are being recommended by the special committee of the National Education Association.

From its own acute needs, however, and from its own disputes a community may learn more than from comparative tables for the whole country. To local reports we have a right to look for a special listing of doubtful or disputed points and for weak links in the administrative chain. No community which has not such special lists easily available can currently ascertain and study its unmet school needs.

The adequate current test of efficiency of teacher and curriculum becomes an adequate warning and serves the purpose of the "Glencoe bumps" at every street crossing which one Illinois town finds more effective than policeman or fine in preventing fast driving by automobiles.

Of urgent importance in all communities is a more definite standard than we have yet developed for the responsibilities of the school trustee. The time will come when we may safely say to those looking for unmet school needs: *Ask the school trustee.*

Because familiarity breeds astigmatism, myopia, despair, or at least procrastination in dealing with unmet needs, it is necessary now and then to bring in some outside light. One method of tearing away cobwebs is to send trustees, superintendents, principals, or teachers to the schools of other communities. This method has not been as productive as it ought to have been, largely because such visitors have not been expected to report their findings frankly to their colleagues and to their communities; in New York City, for instance, reports which cost thousands and thousands of dollars and which, if used, might have saved millions of dollars, lie in dust heaps unfiled, unindexed, unhonored, unused.

Another method of getting outside light is to bring in outside investigators. No community needs outside light more than a community which has been studying itself frankly and progressively, which has nothing to conceal, and which is eager to find where it can improve its school system. Such a community would do well to apply the following tests to its plan for a school inquiry:

1. Place the inquiry in the hands of a small local committee, each member of which has the "fact sense" and each member of which will be able to keep in constant touch with the inquiry. Obviously the program of this committee should be impersonal, non-partisan, and non-factional.

2. Give the committee enough time and enough money to insure a fair test of the

recommendations and constructive steps that should grow out of the publication of its facts.

3. This local committee should not delegate to outside investigators its responsibility for making the inquiry currently efficient. Pledges should never be made "to publish reports as submitted" unless reports stand efficiency tests—as to content and form. Pledges should, of course, be made, if needed, that the investigators' report will not be distorted.

4. No investigators should be hired who do not know how to break educational problems up into their elements. It is far more important to have investigators willing and able to learn what school men believe and disbelieve, and who know how to get facts in support of beliefs and disbeliefs, than it is to have "experienced educators."

5. The inquiry's plan and method should be explained by the committee to the public over and over again. Any part of the investigation which the public cannot be made to understand is not worth undertaking. It is doubtful if any benefits from investigation are worth while which the public does not understand.

6. To help inform and interest the public and to keep the public's questions constantly before official and paid investigators, some volunteer citizen committee should be organized and equipped to use this opportunity.

7. The inquiry should start with problems uppermost in the public mind and should proceed from most obvious and most pressing to less pressing and less obvious questions. Inquiries are often fruitless because inquirers insist upon looking for x and z before they seek a and b.

8. One hundred per-cent problems should take precedence over 1 per cent or 10 per cent problems.

9. Facts, not opinions, should be expected from the inquiry.

10. The inquiry should be conducted not only with dispatch but with obvious dispatch.

11. The inquiry should be obviously constructive from the first day, i.e., should be "vocational" not "academic." Each forward step taken by the schools brings new needs and new facts to light.

12. The inquiry should be democratic, i.e., not by the investigators for themselves or for the committee, but by everybody for everybody thru the investigators.

13. Reports on each subject should be threefold: (*a*) description, (*b*) criticism, (*c*) remedy or reason for maintaining present practice.

14. As rapidly as conclusive facts are obtained, and as rapidly as forward steps are possible, report should be made to the schools and to the public.

15. School officials should be publicly put on record as to facts, criticisms, and constructive suggestions as each subject or field is reported upon by the inquiry.

16. No more should be reported at one time than the public can understand, i.e., not only should interim reports and reports of progress be made rather than one final report, but these interim reports should be given to the public in "doses" which the newspapers will take and the public understand.

17. No conclusions should be stated and no constructive suggestions made which do not proceed from facts.

18. Conclusions should be so stated that constructive steps will be taken.

19. Lists of questions raised by the inquiry, for answering which facts are lacking and further inquiry needed, should accompany each report of facts obtained.

20. The necessary follow-up work by schools and community for utilizing the results of the inquiry should be outlined as the inquiry progresses and summarized as the inquiry ends, as, for example, how current and periodical records and reports need to be modified so as to reflect the extent to which follow-up action is taken by the schools.

21. Money values and money tests should be emphasized and not evaded because both the money cost and the money value of schools are certain to be given ever-increasing

weight in all American communities. It is affectation to decry the same efficiency tests for public education which are now demanded for other branches of public business and for all branches of private business. Any school expenditure which is too esoteric to be discussed in terms of what it costs and what it is worth does not deserve a place in the public-school curriculum.

The era of school inquiries has hardly begun. Within a generation, if not within ten years, every state in the Union and every considerable town will be asking itself the question: "What are our educational needs?" The Training School for Public Service, conducted by the New York Bureau of Municipal Research, has already begun the preparation of men for answering these questions for communities, beginning with the field study of Wisconsin's school system for the state board of public affairs.

The National Education Association can do much to expedite and facilitate both the current and the special tests which go by the name of "school inquiry." The opportunity of a generation now confronts it in the application of the United States commissioner of education for a *big enough program, big enough staff, and big enough appropriation.* To secure funds for this wider program of comparative study is to take tremendous strides in helping every community in the country answer for itself the question: "What are our unmet school needs?"

D. QUANTITATIVE TESTS IN EDUCATION

GEORGE H. CHATFIELD, SECRETARY OF PERMANENT CENSUS BOARD, NEW YORK, N.Y.

The efficiency of our school systems is questioned. Not within memory has the attention of school men focused so persistently in this direction. Investigations of the schools of great cities follow in rapid succession. Methods of organization, of administration, of teaching are subjected to searching analysis. Findings, critical and constructive, dissenting and approving, are presented. Yet the tide of discussion is swelled, not lessened.

Commerce, industry, politics, philanthropy, and other great fields of endeavor are similarly agitated. Before the impact of the oncoming generation, idols, long worshiped, long cherished, are falling. The old order yields slowly; it clings tenaciously to known realities; it rejects the claims of the new propaganda; it denies their universality. And so the tide of conflict moves back and forth in the great fields of human endeavor, disclosing in the lull of struggle the inevitable processes of change.

Elimination of waste is the fundamental doctrine of the innovators—of waste in material, in effort, in energy, in lives, in property, in justice. Nowhere may the advanced stages of the struggle be seen more concretely than in industry, for no field has a more constant and compelling motive—profit. Here are exhibited new processes, new labor-saving devices, new methods of planning, more detailed instructions, more exacting records.

Astonishing statistics show results doubled, tripled even many times. A decreased cost for the producer is claimed—an increased product for the worker. Not that these results remain unchallenged. Where incontestable, they are ascribed to unique and specially favoring circumstances. Aside from these instances, old methods are asserted to be displacing the new wherever the latter have long been tried.

Apart from the matters in dispute, there is in all well-conducted businesses strict accountability for raw material, labor, machine energy, overhead expense, completed product, and residue. Inspection, supervision, records, at all stages of the process; inventories, balance sheets, detailed periodic reports, mark the intimate connection between facts and income. The absolute dependence of effective administration upon complete and well-ordered information is clearly recognized.

For example, in the Middle West a great corporation manufactures stoves on a large scale. The shop history of each stove is kept in detail from raw material to shipment of finished product. The name of each workman responsibly concerned in the inspection of raw material, in the making of any part, in examination and shipment of the completed stove, is recorded. A complaint from a purchaser immediately locates the responsibility upon the workman at fault. The article upon which this care is lavished retails at $15 and upwards. The annual per-capita cost for elementary-school instruction in New York City, by comparison, is approximately $35.

A Pennsylvania steel company is largely engaged in the manufacture of steel tanks and similar articles. A necessary part of the process of construction is the detailed estimate of the sales agent, the orders and receipts for material in the shop, including such details as the number of rivets, the time spent by each workman and machine, a distribution of the overhead expense, and all these records in summarized form enable the sales agent in a distant city to make future profit a certainty, not an accident.

The conductor of a freight train is seemingly far removed from clerical pursuits, yet no care which he exercises over his trailing caravan is of more importance. He and every yardmaster concerned painstakingly report the number, point of origin, and destination of every car under their respective charge. The zealousness of operating employees is not the sole reliance in bringing a shipment to its destination. The central office expects to locate a car for any given date and to approximate closely the date for completion of the journey. Thus it meets the regular and emergency demands of traffic. How fortunate in comparison that school system which can approximate the date a pupil first came within its jurisdiction, and trace his progress from class to class, to say nothing of the date of arrival at his hoped-for destination.

Finally consider the New York Central Railroad and the public-school system of the city of New York—the former run at an operating cost of

$74,000,000; the latter, on the educational side, at an expense of nearly $26,000,000. For recording and compiling information, the former expends proportionately four times as much as the latter, and the same proportion holds when the material and educational phases of the school system are contrasted. As a matter of fact, when the efficiency of school systems is in question, the material of discussion is largely opinion. A technique of investigation and measurement is slowly arising, but its development is retarded by the absence of a generally accepted and recorded basis of fact. There are many figures, but for the most part they are unanalyzed and unrelated, and carry, even to the sophisticated, notions as exact and luminous as the volume of the wheat crop or the fluctuation in steel tonnage.

No doubt at this point there will be impatient protest that for that living complexity, the child, such comparison is meaningless. But is it too much to say that at least the administrator should be expected to know whether all these living units actually come within the scope of his influence, and to what extent? How else may he justify himself on the purely quantitative side when the business man complains of his product; when the social worker recalls the juvenile delinquent; when the criminologist points to the youth of the convict; when the child reaching maturity, unskilled and unwanted, points an accusing finger at the school he was so glad and so quick to leave?

These are not mere generalities. More than 9,000 children in the New York City public schools could not be located by the attendance officer last year; more than 6,000 were removed from the rolls for physical disability as the law requires; more than 12,000 were arraigned before the children's courts, and in 1910, more than 9,000 were convicted; 40,000 children received employment certificates; 60,000 children and more passed from official view and responsibility.

The state has virtually a monopoly in the field of elementary education. It excludes private enterprise because of its own immediate concern. The future citizen, the future producer and taxpayer, are so important to it that it undertakes the business of education for these ends. The statistics just quoted—and they are characteristic of the country at large—show that it is content to know the great majority have been reached, content to ignore those of whose existence and identity it is unaware. It further chooses to ignore the question whether its training has been efficient, whether it has produced the good citizen, the competent producer and rate-payer. It knows that the wheels of industry and trade and government continue to revolve, but it is unable to define or evaluate its part in the process.

Such is the common course of monopoly of all business from which the spur of competition has long been removed. While dividends are regularly declared, while needs do not outpace income, information is of little moment.

The passing of dividends, the need for greater income is the signal for its production. The public now questions the returns for the great sums it so lavishly expends on the schools—it is examining its waste products, the juvenile delinquent, the young criminal, the wayward girl, its matured youth, unskilled and ill adapted to employment. It is noting the success of the great Teutonic giant which long ago set its house in order.

How shall the state measure quantitatively its fundamental problem? How evaluate its efforts at solution? It must account for its raw material at every stage—its waste products, its marketable commodities. It must know the nature and extent of its ever-shifting market—the opportunities open to the labor and effort of youth and maturity so that training may be definitely correlated to such opportunities. This is the function of the continually recurrent census—in more concrete form to know who all the children are, where they are, and the conditions under which they live—what they have done in school and after leaving school, until it may be fairly inferred that the aims of the state have been realized. If the underlying theory is correct, a child can no more be lost to the appropriate training process in one part of the state than in another and, whether the community be large or small, such may be the result unless the responsibility for continuously recording each individual child be definitely located.

The work of the permanent census boards of the state of New York—there are three, one for each first-class city, New York, Buffalo, and Rochester—is founded upon this conception. These boards were created by act of the legislature in 1908, the new statute displacing one providing for a biennial census. The earlier law had met with indifference—the new statute faced vigorous opposition. General Bingham sought its repeal, the mayor failed to take any action. It was not until Commissioner Draper demanded a yea or nay answer and threatened to withhold the school moneys, that compliance was secured, but indifference still continues.

The Census Board is a separate corporate entity, consisting of the mayor, the police commissioner, the city superintendent of schools. It has a separate budget and is not subordinate to the board of education or any other city department. The law, in the following definite language, sets aside the administrative problem of the Board:

> . . . . said board shall always have on file a complete census of the names and residences of the children between such ages and of the persons in parental relation thereto. . . . . Such census shall include all persons between the ages of four and eighteen years, the day of the month and the year of the birth of each of such persons, their respective residences by street and number, the names of their parents or guardians, such information relating to illiteracy and to the enforcement of the child labor and the compulsory education law as the school authorities of the state and of such cities shall require and also such further information as such authorities shall require.

The information just described must be recorded for every child between four and eighteen years of age and provision made for keeping it practically

current in point of time. Change is the most marked characteristic. While some children are passing beyond the reach of the law, others are coming within its scope, and the facts are changed for many of those already enrolled. In any absolute sense, there is no solution with the means available. In a practical way, it is possible to meet the requirements. The law requires the initial enumeration and the amendment of the census to be made by the police and contemplated the use of the regular police machinery. The opportunities thus afforded for policemen on street duty to be off post caused a separate detail of policemen to be made.

A census blank was first devised to be made out for each child. Compactness and accessibility of information were prerequisites, for they meant economy of time, money, and effort. A periodic census may neglect these factors; for one continuously recurrent, it would have been disastrous. Doubling the area or weight of the record card meant doubled filing equipment and floor space, doubled effort in filing and locating records.

A smaller record, clear and related in form, concentrates the attention of clerks, lessens effort, lessens error—augments results. A 4×6 inch card was used. For filling out many items, "Yes" or "No" was checked. All returns were made in ink by the police; the records were filed without recopying.

The initial canvass was made as follows. The public and parochial schools filled out census records for each child on register. These records, arranged alphabetically by street number on the block basis, were assigned with the corresponding territory to the police officers for verification. Specific directions were issued for the interpretation and filling-out of each item. Every family was to be visited, every building and vacant lot to be accounted for. A daily summary of the work of each enumerator was required and compared with the returns. Periodic statements were prepared grouping the results impersonally, and furnished to the individual enumerator, accompanied by his own record. Careless work was returned for revision. Buildings and vacant lots reported were compared with detailed street atlases, and discrepancies explained by outdoor inspection. Fourteen enumerators, indifferent or careless, were remanded to regular police duty. The remainder did excellent work. The initial canvass occupied nearly two years—from January, 1910, to December, 1911. As the sixteen months allowed by the statute for preliminary organization had been frittered away, part of the first year was devoted to planning and experiment. Fifty-six men and a lieutenant were at work from May, 1910, to July, 1911; 200 men would have been required to do the work in a few months. Further delay was caused by the requirement of Commissioner Draper that the census be kept amended in every district where the initial canvass had been completed.

Violations of the compulsory-education and child-labor laws, as reported from day to day, were transcribed and forwarded for the action of

attendance officers. These numbered nearly 27,000. Children physically or mentally defective, and not already known to the authorities, were reported to the number of 3,600—of these, more than 1,100 were mentally defective. One thousand eight hundred neglected and destitute children received similar attention. Criticism has been made as to the validity of the violations of the compulsory-education and child-labor laws reported, but they were undoubtedly correct when discovered and referred. Much time elapsed before action was taken by attendance officers; in the meantime, the law had been complied with as directed by the police enumerators.

It has been said that a current census is impossible. The contrary has been demonstrated in the boroughs of Manhattan and the Bronx. Here the census was kept up to date for the better part of a year. A complete re-enumeration is not made. During the initial canvass, abstracts were prepared for each block, showing for each building, the name of each family and the number of children. (These are shortly to be superseded by new forms giving in addition the given name and date of birth of each child.) Individual census records for children at work or specially reported are also included. Of changes in register reported from the schools, some 600,000 are received annually—those involving discharge or change of residence are similarly classified by residence for the enumerators. To the foregoing, are added the names of immigrant children arriving in New York City for residence, by way of Ellis Island. Armed with these details, the enumerator verifies the facts already recorded and makes new entries only for changes. Visiting frequently the sections where moving is common, less frequently the sections where tenants are more permanent, a highly accurate amendment of the census is possible. Reporting of changes by house-owners and lessees has been advocated but is not yet approved by public sentiment.

The location by name from the files of so-called "lost" or individual children is not yet possible, an alphabetical file being necessary for this purpose. Its preparation is a year's work for ten clerks, including, as it will, more than a million and a quarter names. The appropriation for this work was refused this year.

An enumerator must cover a definite territory. From an alphabetical file, an assignment of work for such a definite territory is not feasible. Statistics also are generally wanted for small areas, usually by blocks. To meet these conditions, the original census records are filed by street numbers and blocks. Until lately, but few requests have been made for the location of lost children. The demand for statistics, the necessity for amendment work, have been constant and not to be ignored.

Machine tabulation has been largely employed, but is completely satisfactory only for congested areas. Small numbers are more readily cared for by hand. A punch card, $7\frac{3}{8}$ inches by $3\frac{1}{4}$ inches is divided into vertical fields or columns—each column permitting a possibility of twelve

printed numbers—0 to 12. Each column or field—two or more columns may be combined—corresponds in position to a field of census facts, the numbers in the column to variations in the facts, as shown by a code. The operator punches a card for a census record. The punch cards for a block are electrically sorted in number groups for each field and counted electrically. The punch cards are filed by blocks and amended, as their corresponding census records are amended. By amending the tabulating cards up to a given date, a correct tabulation as of that date can be had—the work of amending the census not being in the meantime disturbed.

The financial and educational authorities of the city of New York find no problem more difficult than the provision and location of adequate school accommodations. However vast the sums granted for this purpose, the increase and shifting of masses of the population have been greater. Census statistics now afford a reliable foundation of fact. The number of sittings, actual and available, for each school building is a matter of record. The number of school children, actual and potential, distributed by age and kind of school attended, is known for each block. Properly related on maps, it becomes a simple matter of arithmetic to fill up a school to its capacity, from the immediate neighborhood. As the process advances the areas lacking school accommodations are inevitably disclosed. With due allowance for natural and artificial barriers, the size and location of a building to serve the unprovided area may be readily determined. Automatically, the requests of the educational authorities are supported or opposed, the areas neglected or ignored are disclosed.

In 1911 the report of the Census Board to the financial authorities covered requests aggregating nearly $10,000,000, recommended an additional building in a congested section, and disapproved of seven others requested—a reduction of more than $2,000,000. As time passes, comparative figures by years for blocks and areas will show rates of growth or decline. This will be supplied for buildings as well as population. The general population figures for 1900, 1905, and 1910 have been similarly related.

Facts are also available for the study of the conditions affecting high-school attendance, and the consequent development of a system of high schools. These factors are type of school, age, and nationality of pupils, distance from school or transportation, length of residence, and occupation of parents. When connected with adult population figures, these statistics have a similar value for the location of evening schools, recreation centers, playgrounds, lecture centers, etc.

The consolidation of schools and classes will ultimately be based on census statistics, showing the number of children attending different schools by age, grade, and residence, thus accurately relating means to end. Similar information will be available and required for the annual school budgets.

Training for vocation and vocational guidance are topics concerning which much is said today—less is known. The schools are urged to take

up this work extensively. The information already gathered by the Census Board shows that opportunity for minors in the skilled trades does not exist in large amount. If the extension of vocational work in the schools is not to be more than wasted, exact knowledge is wanted concerning conditions and opportunities of work for young people today. Such information requires contact with the individual worker—the worker on the census lists—as well as with industry itself.

The city of Munich this year placed 2,150 out of 2,200 elementary-school graduates in specific callings. How did it do this? Not by guess-work. Each such calling had been carefully studied as to opportunities and requirements, each boy carefully studied to an extent that Americans are likely to call ridiculous, and a careful adjustment made. In New York the Census Board has statistics of workers from fourteen to eighteen years of age. The detailed study of specific occupations is part of its declared future policy.

Earlier in this paper, the existence of census boards was justified because of the immediate concern of the state for the future citizen and rate-payer. Enough has been said to indicate the way in which the problem has been approached. The census board under this, or other more significant name, will undoubtedly become a bureau for children's welfare, in the sense of providing information. At present a struggle has begun for enabling legislation in a definite direction. This may best be described by the following quotation from a report to Commissioner Draper in answer to a query as to the value of the census bureau as a basis for the proper and complete enforcement of the child-labor and compulsory-education laws:

> At present the two statutes are enforced through four different agencies; the census board, the board of education, the board of health, and the state department of labor—dealing respectively with the registration of children, the issuance of working certificates, the enforcement of school attendance, and illegal employment. Each phase, save that of registration, is a minor function of a great department of the state or city government—a method of distribution of powers and duties that can be defended only on the ground of exceptional efficiency, since inherently it makes for friction, obstruction, and delay. This office, as a mere reporting bureau, is unable to demonstrate the validity of its cases and, indeed, must present them to agencies supposed to cover the field from a different point of view.
>
> Sooner or later these functions must be centralized and because of the broad basis of fact upon which the census work is organized, the conclusion seems logical that the duties earlier described should be joined to its present duty of registration. The work in Philadelphia has but lately been reorganized on such lines, and has been most successfully carried on in this way in London for a number of years.

THE FUNCTION OF THE KINDERGARTEN IN THE PUBLIC-SCHOOL SYSTEM

LUCY WHEELOCK, WHEELOCK KINDERGARTEN TRAINING SCHOOL, BOSTON, MASS.

The story of life begins in a garden. It was a pleasant garden, so full of delight that today its name Eden means paradise. But it was not a place of idle delight. There was much to do in that garden. The world was young and the occupants of the garden were new to it. They must take possession of it and learn how to use it. Their education began in observing all the plants and trees of the garden, all the birds of the air, and the beasts of the field, and in naming them. And there was education by work, for the garden must be tended and cared for.

So life began in happy work, and obedience to the Lord of the garden. But an overweening desire for knowledge destroyed Eden, and its dwellers were driven forth to toil where no pleasure is, and to discover the misery of broken law.

This story of Eden is the continual parable of human life. The world begins again for each new life and all things are to be seen and named and used. A natural education begins in the activity of the senses, in the acquisition of language, and in learning the need of obedience to law. More than half a century ago a man, Friedrich Froebel, with the wisdom of the philosopher and the soul of a child, had a vision of what education could do for human beings with such favorable natural beginnings. He gave form to his vision in a scheme of education to which in a moment of happy inspiration he gave the name "Child Garden," thus indicating its scope and purpose. It exalts development and training above knowledge. Its function in a school system is to make the right beginnings of the educational process. It is a part of a whole, necessary to the excellence and completeness of the whole. As a system it has its own distinctive characteristics, and special instrumentalities and methods, which must be preserved in order to demonstrate the principles on which it is founded, and to realize its aim.

All kindergartners would agree on three fundamental Froebellian principles. These are the importance of each stage of growth, the development of self-activity, and the belief that we are all members one of another. To exemplify these in practice thru carefully selected means and the organization of the play activities is the special function of the kindergarten.

A consideration of the first principle shows at once that the kindergarten is not static, but dynamic—that educational means and methods must conform to the stage of development reached and must be progressive. It demands that the selection of educational means must keep pace with the growing needs of children, that they be suited to varying local conditions, modified by temperament, racial traits, and the degree of culture of any given group.

A recognition of the importance of each stage of development constitutes also the strong claim of the kindergarten as part of public education. We will let Froebel himself speak:

> Vigorous and complete unfolding and improvement of each succeeding stage of life depends on the vigorous, complete, and original development of each preceding stage. The boy is not a boy, or the youth a youth, simply because he has attained the age of boy and youth, but by virtue of having lived thru, first, childhood, then boyhood, faithful to the claims of his soul and mind and body.

Neglect of any stage of a growing thing means defect. Neglect of an early stage means serious loss, because wrong tendencies and habits are established.

To the school society relegates the task of equipping its future members with capacity for service and ability and desire to work for the good of the whole. The state insists upon a certain period of school training, that it may preserve its own integrity. This period is abbreviated more and more by the pressure of industrialism. If it be true that in America nearly 50 per cent of school children leave school before the sixth grade, and that the average period of school attendance is only five years, then every year conserved for education at the beginning is of the utmost economic value. It would also seem economically desirable to give the best tuition and guidance at the beginning, when the kind of world each child is to see and to make is largely determined. From the relative cost of education in different sections one would judge that this fact has not been fully recognized. In the 1910 report of the superintendent of public instruction in California, made with no reference to an argument for the kindergarten, the following figures are given:

Cost per year for each pupil enrolled in public kindergartens	$ 22.80
Cost per year for each pupil enrolled in elementary schools	31.98
Cost per year for each pupil enrolled in high schools	74.85
Does not include buildings.	
Cost per year per prisoner in penitentiary	255.85
This cost in addition to earnings of prison.	

The recent report of the Boston School Committee gives the following figures:

Cost per pupil in elementary schools	$31.98
Cost per pupil in Latin and high schools	76.63
Cost per pupil in Boys' Latin Schools	94.31
Cost per pupil in Girls' Latin Schools	69.69

The cost for elementary schools includes salaries of the supervisors of kindergartens and of domestic science and salaries of twenty-two truant officers, aggregating over $30,000 yearly.

In favored Brookline, with small classes, the city expends $55.20 for each kindergarten pupil, and $91.02 for a high-school pupil.

From the West, Miss Vandewalker reports that in Milwaukee the cost per pupil in the grades is $29, in the high schools $58. In Chicago it is

$33 in the grades, $57 in the high schools, and $89 in the Technical High School. In Detroit the cost in the lower grades is $31, in the grammar grades $41, and in the high school, $67. These figures were taken a year or two ago, but the proportion probably remains about the same.

Has this economy in equipment and teaching force in the lower grades anything to do with the necessity of employing truant officers at considerable outlay of school funds? Would the boy crawl like a snail unwillingly to school or go under escort of a truant officer, if he found there a place which satisfied all his desires to know, and all his wish to express, and his will to do? The teacher who can thus minister to the needs of childhood is beyond all price; but she also demands a price.

A recent article in the *Journal of Education* shows the value of the kindergarten to the school system in minimizing the number of retarded children. About one-half of all retarded children are retarded in the first two years of school life.

> The retarded pupils cost the taxpayers upward of $25,000,000 a year. They cause four-fifths of the nervous strain of the teachers. They rob the rest of the pupils of much of the teachers' attention that belongs to them. To save the $25,000,000 waste, the teachers' nervous strain, the time and effort that belongs to all the children, would be a vast achievement. The kindergarten can do all of this and more if the primary grades will accept their share of responsibility for the adjustment. If the primary school accepts its responsibility, a kindergarten promoted class may keep itself very near a unit for the entire eight grades. The kindergarten may save the taxpayers many times the cost, may postpone the teachers' retirement several years, and impart to the work with the other children an inexpressible impulse.

In Boston the raising of the school age to five or five and a half years means a longer period in the kindergarten and has already shown a reduction in the number of retarded pupils.

So far the school system provides better for the small number who finish their education in the upper grades than for the many in the kindergarten and the lower grades, who never get to the top.

> There are about 5,000 kindergartens in the United States which enroll approximately 250,000 children. But this is an insignificant number, less than the number enrolled in little Belgium or in Austria-Hungary, and less than half the number enrolled in the infant schools of either England or France, altho the population of both of these countries combined does not equal that of the United States. [Nina Vandewalker, in *The Kindergarten the Basis for Public Education.*]

The development of the fundamental before the accessory muscles gives a natural term to large, free-play movements, before the hand is ready to grasp the pen as a tool of language. The gradual awakening of the powers of careful observation and discrimination, dependent on developing brain centers, points to the wisdom of preparing for the recognition of the signs of language by preliminary exercises in form, color, size, and measurement. An alphabet of things should precede the alphabet of the primer. The progress thru the school grades and the development of later capacity will

be the final test of the "wonder-working" Montessori system, which initiates children into the arts of writing and reading at the age of four.

Aristotle, Quintilian, and other wise men of the past argued that the best teacher should be given to the youngest children, on the ground that the formation of right tendencies, aptitudes, and character was of the highest importance to the state. For the moderns, Professor John Dewey has said:

> The American people believe in education above all else, and when the educators have come to some agreement as to what education is, the community will not be slow in placing at their disposal the equipment and resources necessary to make their ideal a reality.

When kindergartners, superintendents, and other educators decide that the kindergarten furnishes the best basis for the public-school system, and agree as to the type of kindergarten desired, it will be established as firmly as the primary school and not subject to the vicissitudes of opinion of short-sighted taxpayers.

The advocates of the theory that the young child is a "little animal," and should be left free to carry out his animal impulses in some convenient back yard, forget the scarcity of back yards in a congested city district. They also ignore the world-wide proof of the claim that those who guide the first seven years of a child's life may make of him what they will. They fail to see that a civilization which desires to "let the ape and tiger die" must view the child as father to the man. The state may later have to pay $255 a year to protect itself from the neglected child, who may be initiated in his formative period into the standards and ideals of the social group at a tenth of that cost. As a thinking animal a child's mind demands some attention, as well as his body.

If it be conceded that the beginnings of education are important, what is the best beginning? Has the kindergarten demonstrated its reason for being? Has it made good? Judgment of any system based on random observation of individuals is unreliable, whether made by a university professor or in the columns of a popular journal. No careful and extended examination has yet been made of a group of kindergarten children kept as a unit thru the grades, and compared with other groups not starting in the kindergarten. Until such findings have been made public there are no data for accurately determining the more rapid transit of kindergarten children thru the grades.

> With prejudice it is useless to reason, as it did not come into the world through reason.

We must judge the kindergarten as we do any other part of the school system, by examining its aims and methods to see if they are true to the general purpose of school-training. We must then insist that its practice conform to its declared educational aims. No one can claim that the kindergarten has fully realized its aims any more than the high school has

reached its ideal of scholarship, or our democratic country the ideal of democracy.

"A man's reach exceeds his grasp," and the kindergarten has still its heaven to reach. Its aim is growth, not *knowledge* or *intellectual advancement*—growth in wisdom and in stature and in favor with God and man. Its method is determined by the two great principles already stated: self-activity and interrelationship. As to the first, there seems to be rather universal testimony from primary teachers as to its effectiveness. The objection to kindergarten children most often heard from first-grade teachers is that they are "too lively." In a process designed to promote efficiency, initiative, and power, that is not a serious objection. The opposite of lively is deadly, and no grade would accept that term as descriptive of its procedure. Where the best co-ordination has been made between the kindergarten and the primary grades, the best results of kindergarten training are observable.

For the thirty years of its existence in this country, the kindergarten has held to special educational materials designed to aid and abet the child's self-activity. These materials are used to develop the powers of observation, comparison, investigation, experiment, and invention. They are organized into a series, that there may be progressive guidance and consecutive exercises. They offer means of sense training, but this is not their final purpose. Neither is motor training or manual training the chief end. Their goal is complete activity, leading to efficiency, which is the power to do, to produce.

Says Froebel:

> We must begin in infancy to discipline and train the hands and fingers. We must teach the child to use aright the different members of his body, so that when he becomes capable of productive activity the objects he produces may have real worth.

The "complete activity" demanded by Froebel, "in which are blended body and soul, mind and heart," calls for application, interested attention, and the artist's joy in making. It would dispense with truant officers. Lack of fiber and disinclination for real work discovered among the students in some universities are not to be traced to the oft-times sporadic and brief period of kindergarten training, but to social conditions. Master Reginald, in his luxurious home, surrounded by dumb waiters and speaking waiters, with buttons to press for the supply of all his whims, whose very toys are wound up to spare him the trouble of starting them, will no doubt carry marks of enervation with him thru all the school period, which the best kindergarten cannot eradicate in three or six months, or even a year.

This aim of productive activity distinguishes the kindergarten at once from the Italian system now so much before the public. In a recent article in the *New York Times* illustrating this system we read:

> Although the games are played and the lessons taught with mechanical toys and blocks, bits of wood, and pieces of cardboard, and silk and leather cords, the children do

not follow out any ideas of manual training in "making things." They do not make anything. They simply play with the apparatus the games that teach the day's lessons.

The theory of education thru play is common to the two systems, but the use of play-materials to provide a quick and easy approach to the arts of writing, reading, and arithmetic is not a part of the kindergarten scheme. Its materials are developing, not "didactic." It makes sense training and motor training a part of its educational plan, but not the whole. Nor does it limit its production to handwork. To build a city is well, to make a City Beautiful is better.

The song of the singer, the rhyme of the poet, the tower which is "frozen music," the vision of the artist, who sees an angel in the marble, the words of the preacher—these are the city's best wealth. The possession of these things makes any city a Rome to which all the world builds roads. Because we believe this, the kindergarten introduces those elements of culture which develop power of appreciation and love of the beautiful. It gives various means of expression, that the child may learn to speak a varied language and so come to choose his own. The walk to read the great story-book of Nature, the excursion to see how the world works, gardening to teach the lessons of growth and nurture—these are the means the kindergarten uses to open the eyes of children to the world in which they live.

The song, the rhyme, the dramatic play, and the story appeal to feeling and influence the imagination—that faculty which rules the world. The scientific pedagogy of Dr. Montessori places emphasis on practical life, and disclaims any appeal to the imagination. But it is most unpractical to ignore the faculty which has built cities and adorned them, bound continents together, and given to man the bread of life. It is necessary to acquire language and a good vocabulary, to secure good pronunciation and enunciation, but there is a speech uttered from the heart out of which are the issues of life. The child is a poet, and song and rhyme are a part of his natural utterance.

Finally we must consider the function of the kindergarten as a place for social training. It would be difficult in a public-school system to promote any theory of education which did not recognize the value of group and co-operative work. The ideal citizen is the neighbor. Who is my neighbor? is a question the school is to answer, if it meets the demands of the society which supports it. School is not preparation for society. It is society. Here as in the greater world the law of membership holds: "We are all members one of another." The preliminary to working together is playing together, and at all stages we must live together.

The breaker of the law, from the man who overspeeds his automobile to the man who defrauds investors and stockholders, from the drunkard to the professional thief, is a man who has no sense of responsibility to his fellow-men. He doesn't feel his membership in society. A child who has been to kindergarten has learned to play fair; to think of himself as only one among many; to acknowledge the rights of others; to work together

and not against. These things become part of him, are instilled into his blood, woven into his nerves. His prejudices and impulses are all toward good citizenship. [Quoted from Professor Holmes, *Does Kindergarten Pay?*]

Free play gives scope for the development of individuality. It originates. It discovers. It explores. It gives freedom and power.

Organized and guided play gives collective power. It enforces the virtues of the group—loyalty, a sense of law and order, obedience and self-subordination, and co-operation. It is a drama in which each must act well his part. Organization and direction of the play impulses, control, and obedience to the law of the whole are absolutely essential in any group of children where educational and social motives are considered. Our American republic is founded on the belief that "United we stand, divided we fall." Men are willing to bleed and die for this belief. To fail to demonstrate it in school training would be a fatal defect.

Because of its adherence to basic principles of education and life the kindergarten claims its place in a public-school system. By its industrial training it makes the beginnings for practical life, by its cultural training for a good life, and by its character training for a righteous life. In the past its task has been to leaven the school with its spirit, to demonstrate the educational value of play, resulting in the municipal playground, to show the importance of the story and dramatic game in education, and the significance of group work in relation to community life. Its task today is to improve itself by better practice of its own ideals, and to prove its claim to be the basis of the public-school education.

Its mission is to keep and tend a Child Garden wherein grow the seeds of the tree of life, whose fruits shall bless the school, whose leaves are for the healing of the nations.

TOPIC: PROBLEMS RELATING TO CHILD WELFARE

A. THE DUTY OF SUPERINTENDENTS IN THE ENFORCEMENT OF CHILD-LABOR LAWS

OWEN R. LOVEJOY, GENERAL SECRETARY, NATIONAL CHILD-LABOR COMMITTEE, NEW YORK, N.Y.

Our critics are urging that the National Child-Labor Committee add what they call "constructive" features to our campaign. Many say in effect:

> What good do you accomplish if you only shut the child out of the factory, mine, sweatshop, and street trade and leave him in idleness? Is not your work all negative? Do you not overlook the entire positive side of the problem? Is it not more important that the child should get a good education than merely that he should be taken out of the mill?

If this criticism were fair it would be a severe indictment of a philanthropic enterprise that has made powerful appeal to the public. There

can be no justification of a policy which effects a half-cure and leaves the victim to limp out of the hospital to fight a battle against misfortune. The record of better child-labor laws secured in thirty states last year and in many states in our preceding six years of work means little if it stops there. But we refuse to plead guilty to the indictment. The effort to take little children out of industry and to prevent older ones from excessive or dangerous exposure is not an isolated enterprise, but it is a specialized enterprise. We recognize the existence of other agencies better equipped, more highly endowed to safeguard the interests that may be left exposed by our work. This is an age of specialization and our specialty is the release of little children from unfavorable industrial conditions. If we attempted more we should doubtless fail in even this.

While we acknowledge intense interests in the educational problems of our day and always co-operate in efforts to secure better educational laws, and while we realize that certain defects in school methods and equipment seriously confuse the whole problem of child-labor reform, we must at the same time decline any responsibility beyond that of other intelligent citizens. That side of the problem belongs to education. If children are thrown into vicious idleness as the result of laws which end their servitude in workshops and mines, the responsibility is not ours—it lies at the door of the schoolhouse. The American public-school system is said to cost our people not less than $400,000,000 per year, while various child-labor committees expend, I suppose, less than $100,000 per year. But there are people influential enough to defeat our child-labor bills before state legislatures because we will not guarantee to put and keep every child in school whose labor is interrupted by the proposed law.

Our work is of mutual interest and our efforts must interrelate, and recognizing the service school superintendents can render in the enforcement of child-labor laws I venture a few specific suggestions.

1. *Public school not a misfit.*—I need not dwell on the importance of emphasizing the dignity of the American public school as it is. Not even the church is subjecting itself to so merciless a grilling. Its most emphatic critics are school men. And while we should like to go on record as indorsing all efforts to strip the school of outworn or meaningless incumbrances, there is something to be said for the school system on its present basis and we are in danger of driving children away by our frank confession that it is so bound by tradition and custom and a top-heavy curriculum that it is foreign to our present needs. Even as it is, let us make it clear to the public that the school is neither a misfit nor a failure. I mention this because of my second suggestion.

2. *Push compulsory attendance.*—The school superintendent can help enforce child-labor laws by pushing compulsory education laws into every section of the country. This is taken for granted in most parts of the country, but there are still sections in which, because of ignorance, pre-

judice, or tradition, the people are unwilling to accept this only foundation on which a public-school system can rest. It is not difficult to announce our belief in compulsory education at a convention like this, but what I am urging is that the man, whose duty calls him to the South and to places not south where people are hostile to compulsory education, shall have the courage of his conviction and insist that the children of those sections are entitled to the same educational benefits that accrue almost automatically to children of New York, Massachusetts, or Ohio. A powerful association like this can and should back to the limit one in such a position.

A glance at the census report of illiteracy in the various states outclasses all argument that can be advanced for compulsory school attendance, but from the standpoint of the working child the service of such laws is demonstrated by the fact that most children begin work within a few weeks of the birthday set by law as the minimum age. If the law releases the child from school and to work at fourteen he goes to work at fourteen, if at twelve he goes to work at twelve, while in the few states in which employment of children under sixteen is being made inconvenient they are tending to stay in school to sixteen.

3. *The public school is public.*—I further suggest that it is the school superintendent's duty to get all the children in school. For this he must have a correct school census which can be best checked up for accuracy by frequent reports from teachers. These can keep him in touch with the delinquent members of their classes, and with the family life of the community. They can get from young scholars valuable information about older brothers and sisters—their ages and occupations. Obviously a school census must also cover every parochial and private school, and no argument has to my knowledge ever been advanced against placing in the hands of public-school superintendents such a complete compendium of information about all the children in the community that he will be in possession of a full census.

The school superintendent is not clothed with discretionary power. When 10, 15, or 25 per cent of the children of a city are not in school, when their existence even is unknown, and when they are left to their own desires as to their future, someone has been false to a public trust. The public school is *public:* the taxpayer contributes to its support as a matter of business. We believe popular education contributes to a man's life; his family is more secure; his property enhanced; the market for his products stimulated according as the people of the country are intelligent. Therefore the citizen has a stake in the education of every child—not of almost every child, but of *every child*—and he has a right to demand that his contribution to the public fund in the form of taxes is equitably distributed.

I need not pause to discuss the practice of truant officers. The employment of one man to chase truants scattered over a hundred miles of streets,

or the employment of a truant officer whose only recommendation is that fifty years ago he bravely carried a musket, or one whose only service to his city has been as the tool of some political party: these and other examples have made the truant officer in many localities a sorry joke. But without discussing this and turning to more satisfactory examples, we are aware that the typical truant officer considers his duty done if he rounds up the children who have fallen out of school for a few days and gets a fair percentage of them back. The exceptionally good truant officer feels his duty done if he gets every enrolled child in school. But where is the truant officer who regards himself responsible to the state to see that no child in the community is missed; to look up the family that moved to town last week; to report to their destination those children who move away? The duty is not easy to perform and we are too prone to overlook the demand child labor makes, not only on those children who are under age, but on all those with insufficient schooling. Whatever criticisms have been made of the truant officer rest in their final analysis upon the superintendent. His regulation of this department of the work may be difficult and may involve him in embarrassing complications, but there can be no question that the matter is vital and should be made with him a determining issue, if necessary.

4. *The school a social agency.*—The school superintendent will help enforce child-labor laws by recognizing that the school is the servant of all the children all the time. The interest of many teachers appears to be confined to children actually in school, or if to all the children who ought to be in school, is frequently confined to those only during school hours. In other words, it is a professional interest. This is said not in criticism, but in explanation, and the superintendent is in the best possible position to combat this professionalism among the teachers. The man fulfills his professional duty when he sees that children are properly cared for between the hours of nine and four, but the problems of education are so intertwined with the family problems of food and clothing, of employment, of recreation and rest, of ventilation and sunlight, that we cannot separate them. Many of us see in the public school the promise of a social supervision of the home care of children which shall eventually mean for every child an opportunity to develop. The school superintendent and his staff can best of all public officials recognize the existence, problems, temptations, and possibilities of children of school age before nine o'clock in the morning and after four o'clock in the evening. Discussions of delinquent and backward children are superfluous unless accompanied by facts gathered by an investigation as in every science. These facts can best be secured by school workers studying the living problems of their own communities.

5. *Why children are let out of school.*—Superintendents can directly aid in the enforcement of child-labor laws by arousing in their principals and teachers a conviction that it is unprofessional to misrepresent the age

and ability of children in order to get them out of school. In many cities it is the official duty of the school principal to furnish the information on which children are released from school and inducted into industry. Even where laws are specific they are sometimes disregarded. Affidavits are issued by subordinate clerks entirely ignorant of the law. Sometimes with a dispatch which can only be explained on the ground that the principal believes that the child will be better off out of school than in, these helpless children with no guide at home or elsewhere are thrust by thousands out of the schoolhouse and into our child-employing industries. Whatever our legal standard may be, we should insist on its observance and should compel definite steps to guarantee that no improper child shall be released from school, and at the same time every facility shall be given to the proper child to make the transfer he desires. To perform this service the superintendent must see to it that every teacher on his staff knows the child-labor laws of the state in which the city is located. This can be done by means of teachers' meetings, by placing copies of the laws in the hands of each teacher, and by putting the school in direct touch with the Department of Factory Inspection, the board of health, the juvenile court, and child-labor committees.

The superintendent should resist the desire of teachers to rid their classes of backward, unruly, or disagreeable children. We recognize that there are children who fit all these descriptions and that one of the sore afflictions of the school teacher is the endurance of such. Nevertheless these are a part of our citizenship; these are the very children on whom special attention should be bestowed rather than allowing them to drift out of school to lose henceforth any inspiration or guidance this institution can afford. When the child begins to lose interest in school, partly because of his own changing mental and physical condition which ordinarily occurs at about the fifth or sixth grade; partly because his parents are nagging him to earn his own living; partly because of the example of other misdirected children, he becomes an offense to the ambitious teacher who is eager that the whole class shall make a fair showing and that her faithful seed-sowing shall bring forth abundant fruit. At this point the effort to arouse a public sentiment in favor of child-labor laws is imperative. The school superintendent is the best possible person to do this, and many are doing it by encouraging teachers to a personal acquaintance with pupils and their home environment; by developing parents' associations; and by attempting to secure an exchange of experiences between teachers and parents' associations thru such agencies as the Public Education Association, giving special attention to exceptional children. If there were no solution offered by educational institutions themselves, I should hesitate to appeal to this point for exceptional children, but special classes for children defective in sight, hearing, or mental equipment have been so well established in a number of states that the idea of special training is

no longer an experiment. The superintendent must be the schoolmaster of the board of education and the whole community regarding that percentage of his school children who slip thru the fingers of the authorities and become lost for lack of a substantial increase in school equipment in order to meet their special needs.

6. *Practical education.*—The superintendent can help enforce child-labor laws by giving the child who wants employment something to do. We must articulate the school with life instead of making it fit only the few who want to go to college. The demand today is widespread that we develop in our highly organized city-school systems a principle which was fully developed, altho in very crude form, in the old log schoolhouse familiar to some of us thirty years ago. It was possible there to combine industrial training—training which existed not for its own sake but for the sake of getting things done on the farm—with what little scholastic training the school had to offer. It was unclassified and bungling, but it taught hundreds of boys and girls the dignity, honor, and necessity of hard work and it made them appreciate during the school hours that they were not and could not be isolated from the actual problems of life. We shall hold the children in school; we shall win the support and loyalty of parents; and we shall eventually win the wholesome respect and right co-operation of those elements in the community that want to use these children, according as we emphasize the practical phases of education and link every course to living problems. It is for the educational effect on the children quite as much as for the purpose of securing obedience to child-labor laws that we urge this educational revolution. At the present time the three defenders of child labor are the employer, the parent, and the child. Progress against such a combination is slow and discouraging. A school curriculum fitted to the needs of our industrial civilization will rapidly win the allegiance of at least two of these allies, and with the parents eager to keep their children in school to the very last moment and with the children quite as eager to remain, the advocates of child-labor reform could afford to ignore the desires of that small percentage of employers who fatten on the product of the children's toil.

Much has been said recently in criticism of the eight-year course and the six-year law. It has been pointed out that the child who obeys the compulsory school law in many states leaves school before completing the primary course and it has been proposed to redivide our course of study taking two years from the elementary course and adding two years to the high school. It is, of course, unfortunate that the line of cleavage in school comes at the line of cleavage in the pupil. It is doubtful, however, whether the change suggested would accomplish the purpose desired, or whether on the other hand it might result only in the child breaking away, in many instances, two years earlier than now, having completed his primary-school course. Shall we not aid more in holding children in

school if we develop some plan of filling the last two years of the elementary-school course with practical applications of the instruction which has been mostly theory in the first six years? We might thus try to get the child started in his new line of educational development; might arouse his interest in the laboratory methods involved, and, having given him two years of this before he finishes the elementary grades, awaken in him an intensity of interest in the four years of opportunity to follow. We shall thus help to bridge the chasm into which so many children now fall.

7. *The teacher must know industry.*—It will be impossible, however, to develop wise industrial training in our public schools unless superintendents and teachers become familiar with local industries. The development of vocational guidance is one of the most interesting adventures of the new education: it is worthy the highest commendation and encouragement. But I believe I voice the opinion of the leaders of this movement in Boston, New York, Cincinnati, and other cities when I say that there is in this and in the attempt to develop industrial education a point of caution we must not overlook. Many assume that if the children of our schools can have this new education instead of the old; if we can train them in school to make things of wood and iron and brass and cloth and dough, instead of as in the old days teaching them only Latin, Greek, and calculus, we shall be able at once to turn out into American industry an army of skilled and highly intelligent operatives who will lift our industries from their present unsatisfactory plane and will give employers of labor good and faithful servants.

We have watched with intense interest the development of half-time schooling for high-school and college students, combining education thru books with technical training; but we need to recognize that when we treat of the elementary-school child, there is another factor. There are industrial opportunities offered for the sixteen- or eighteen-year-old boy in many of our communities. He should be encouraged to seize opportunities and advance upon them. The same is not true of the twelve- or fourteen-year-old child, and when it is assumed that if a thousand children of this age are properly trained in school they can at once find the thousand jobs awaiting them in their city, the fact is overlooked that an examination of those jobs will reveal that at least seven hundred of them are unfit for a child under any conditions. This is true anywhere outside of agriculture. Economic pressure because of family poverty, and the pressure of industries which want to employ children are, in my judgment, the two chief factors in drawing children away from school today. If the teacher knew the nature of the job that awaits the child on leaving school, he could often dissuade it from entering that industry. Complain of the poor training our children get in school if you will, but American industry needs training more than do American children. The job that awaits the child is farther from the ideal than is the child. If our efforts to train our

children industrially and to direct their minds toward vocation simply serve to make a larger number of them appear to fill the jobs that yawn for them at twelve or fourteen years of age, we shall have committed a sin against our civilization, and against the laws of human economics for which it will be hard to atone. But if I rightly understand the motives of those vocational guidance leaders who are fashioning new educational movements today, I agree with them that our chief interest in vocational guidance and industrial training is because of our belief that this work will help to revolutionize the school course. By bringing industrial considerations into our school course; by making children intelligent as to the history, significance, and opportunity of various occupations; by teaching the dignity of honest labor and the economic sin of making bad goods out of good material and the twin economic sin of paying wages that will not sustain life in reward for labor, we shall enrich and enlarge the school curriculum, making it so attractive that children will voluntarily remain in school one or two years longer than at present, and we shall save just that much of childhood to a richer, fuller maturity.

The sum of all this is that our work is one. While school authorities and child-labor committees may seem to be working in different fields and asking aid and favors of each other, our efforts interact in the same field. On the one hand, our efforts to secure child-labor laws and their enforcement, which sometimes appear arbitrary, are in fact only a part of the effort to lift from children the pressure which now crushes them out of school. And when we ask school superintendents to aid in enforcement of child-labor laws we are only seeking to offer them a tool with which to do their work more conveniently and to make the school serve more of the children.

B. HOW FAR SHALL THE PUBLIC-SCHOOL SYSTEM CARE FOR THE FEEBLE-MINDED?

JAMES H. VAN SICKLE, SUPERINTENDENT OF SCHOOLS, SPRINGFIELD, MASS.

The opinion is gaining ground that the care of the positively feeble-minded, like that of the insane, is a state function and not one for local communities. Few states have yet made adequate provision for the care of the feeble-minded, consequently for the present most cities and towns must do what they can independently till the state is ready to carry the full burden. The public is slow to realize the extent and gravity of the problem. One of the most competent authorities places the number of feeble-minded in any community at three to every one thousand of the general population. These are individuals who cannot sustain themselves in competitive industry. They remain children all their lives—children in intellect and will, tho adults in stature and in instincts.

Boys of this class, if left to themselves, are likely to drift into criminality.

Being too inefficient to secure steady employment, a life of criminality proves the path of least resistance for them and they soon come upon the state for support in our penal institutions. We know that large numbers of the inmates of our jails and prisons are mentally defective. At the expiration of their terms they are again thrown out upon the community no better able than before to sustain themselves honestly, and with even less will to do so. Out of prison as well as in prison they are a public charge.

The feeble-minded girl, if unprotected, is a still greater menace to the community. While there are feeble-minded children born into good families, such cases are sporadic. They amount to less than 20 per cent of the whole number. Eighty per cent of the feeble-minded are so by inheritance. To prevent the marriage of feeble-minded girls, and to shield them from temptations to which they are notoriously easy prey, is obviously the duty of society as a plain matter of self-defense.

What can the schools do? The public school is one of our social institutions and as such it may justly be expected in work with the feeble-minded to do whatever its publicly provided facilities permit it to do without neglecting its other functions. Some of the things it can do in this direction are as necessary for the protection of the normal children as they are advantageous to the feeeble-minded themselves. Each type needs instructions different from the other. The school can gather the feeble-minded into groups for special treatment and care, and it must do so much in the interest of normal children whose progress the subnormal impede if retained in regular classes. Furthermore, since the obscene and indecent acts which teachers sometimes have to correct are almost invariably committed by mentally defective children; on this account also the school organization should see to it that normal boys and girls are protected as far as may be from association with those whose sense of decency is lacking.

While feeble-minded boys are within the usual compulsory-attendance age, they are not a menace to school or society if taught in separate classes. It is when they are fourteen or sixteen years of age or over that they become a menace. The feeble-minded girl may become a menace several years earlier. The public school cannot, therefore, with safety retain feeble-minded children very long without a radical addition to present means for their care in the form of residential homes or colonies with farm, garden, shop, and productive industry such as are now provided only by the state. There must be separate homes for boys and girls to which they would be legally committed for life. This would not, of course, be necessary where the feeble-minded boy or girl has a good home and reliable parental protection. It would, however, be necessary in a very large majority of the cases.

It has been suggested, if parents are unwilling to have their children transferred to such a colony after they have exhausted the resources of the special public-school classes and have left school, that the feeble-minded

may be guarded by teachers or probation officers who keep watch of them at their homes, and, upon any indication that they are going wrong or becoming in any way a menace to society, take immediate steps to have the state interfere and take such children to the colony home. Should society adopt this plan of self-protection, the school might properly be called upon to aid, since the teachers of the special classes are the only ones who know intimately the characteristics of the children in question. At any rate, it is manifestly important to have all subnormal children, except idiots, attend school during their earlier years, if only for the purpose of being studied. Some thus studied prove to be only backward or slow in developing and may safely be returned to the regular classes after time and special help have co-operated toward improvement. Specialists expert in this work find it impossible to determine, except after long observation extending in many instances over several years, whether a child is feeble-minded or merely backward, hence the special class in the public school serves its most useful purpose as a clinic in which suspected cases are slowly and carefully diagnosed. The mental condition of a child should, however, be determined as early as possible, certainly within the first two years of his attendance at school, lest habits of inattention too bad to be corrected be formed, and lest he become chronic in never accomplishing anything. These children are in special need of the inspiration of success. This they get in the special class where the tasks set are within the grasp of their feeble powers.

The teacher of the special class should be equipped, not only with technical knowledge of mental defects, but with ability and willingness to enter into sympathetic and friendly relations with parents of feeble-minded children, gradually and gently acquainting them with the child's real condition and with the advantages which the state colony offers, and finally securing their consent to a transfer to the institutions. The most delicate and individual work is required here, and the teacher who undertakes this service must be an exceptional person. One such in any single city, except perhaps in a dozen of the largest, would probably be sufficient, since other teachers with less scientific preparation could serve in auxiliary centers under the guidance of the single expert. Teachers of regular classes should call the attention of the specialist to suspected cases. These the specialist should observe in their rooms and advise for or against a transfer to the special class.

The school physicians and other physicians of the community, and social agencies of various sorts, should be drawn into co-operation so that each child may be put into as good physical condition as possible—his teeth mended, his defective eyesight aided by glasses if necessary, his body nourished by food and protected by clothing, either at public expense or by philanthropic endeavor. Hygiene, exercise, and manual industry should be the prominent features of the schooling of these children. The ordinary

curriculum should be in evidence only incidentally. The public school will render its greatest service in fitting these positively feeble-minded children, as far as may be, for self-support under close supervision in some of the simplest industries that can be carried on in colony homes, and in sifting the human material that it handles so that the various elements will reach their proper goal, this goal being life in society for the curable cases, life under protected conditions for the incurable.

Another service which the public school can perform is that of acquainting the public with the gravity of the situation and the need of greatly increased facilities for dealing with the growing menace of the feeble-minded. To this end it is important that permanent records be kept which will afford cumulative evidence of a convincing character. Such records have been kept in Springfield. During the past six years thirteen pupils have gone from the class to the state institution at Waverly, sixteen have regained their places in the school grades, three have entered parochial schools, eleven have moved away, and eighteen are regularly employed. Twenty-nine have had physical defects remedied.

In the words of Dr. Fernald, of Waverly, Mass., from whom I quote:

> The one great deduction from the sixty years' experience in the education of the feeble-minded is that under the best conditions only a very small proportion even of the higher-grade cases become desirable members of the community. They need protection and care and the family and community should be protected from their certain tendency o drift into pauperism, prostitution, and crime.
>
> It should be remembered that under the most favorable conditions hitherto, a very large proportion of feeble-minded persons, even of the higher grades, eventually become public charges in one way or another. No one familiar with the physical and mental limitations of this class can believe that any plan of education will ever materially modify this fact. Any relief as to public support to be obtained from public-school training can be only temporary. Feeble-minded children may be tolerated in the community, but it is a great responsibility to inaugurate any plan on a large scale which does not withdraw from the community the defective adults. The feeble-minded are powerless to resist the physical temptations of adult life and should be protected from their own weakness.

C. *THE CITY TRADE SCHOOL—AN IMPORTANT INSTRUMENTALITY FOR IMPROVING THE VOCATIONAL NEED OF THE CITY CHILD*

CARROLL G. PEARSE, SUPERINTENDENT OF SCHOOLS, MILWAUKEE, WIS.

As young people grow up they betake themselves to various avocations. Some enter commercial pursuits; they become bookkeepers or cashiers or stenographers or salesmen, or in some such manner have to do with buying and selling or the records thereof. Some enter the professions and become doctors or lawyers or engineers or preachers. Some become farmers or stock raisers, and coax the soil to give up its wealth. Some are laborers who do the unskilled work of the world for the unskilled workman's wage.

Some find their way thru the more or less difficult channels which lead into the skilled trades and become craftsmen, or craftswomen.

The state has long recognized its duty to provide vocational training of certain sorts. Engineers and doctors and lawyers, as well as farmers and dairymen, have long been taught for their work at state expense; of late years the need of commercial training has been fully recognized and vocational training of this kind is now given in a multitude of high schools.

But not all young persons wish to enter the professions, or to work in commercial lines. A considerable number wish to learn trades and become craftsmen. A considerable number, also, of the contingent who now drift into some form of unskilled labor, have the ability to become skilled mechanics if a suitable opportunity were given and their attention turned to the matter. There is a demand for some adequate means whereby these young people can learn trades.

But this is true not merely from the side of the young people; the manufacturing and building employers want more good mechanics than they can get. The supply and quality of skilled craftsmen is not being kept up. And this need felt by employers is supplementary to the need of the young people who must have the proper training to fit them to fill the responsible places into which the employers of skilled labor would be glad to put them. It is reasonably clear that some means, either old or new, is required to supply this demand for industrio-vocational training.

The old methods of training skilled mechanics have broken down; they are not, today, producing either the number or the quality needed. This situation is probably the result of two causes: first, not enough youths enter upon and complete apprenticeships; second, those who do serve apprenticeships do not get the same kind or quality of training which apprentices received a generation or two ago.

The shoe is no longer made by a single shoemaker, who cuts and lasts and soles and binds and finishes; it is made in a factory where the completed shoe has passed successively thru the hands of a score or two score of pieceworkers, each contributing a single part or performing a single process. Commercial considerations usually keep each worker at the single process or machine at which continued practice gives to him most speed, and to the establishment most profits. Few, very few, have a chance to "work thru" all the processes of the trade and become familiar with all the machines; the great, the very great majority become pieceworkers or partmakers. They do not know, and if called upon, could not do, more than the one or the few processes thay have learned. In other trades, machinist and toolmaker, carpenter and joiner, blacksmith, weaver, the same change has come. Under these conditions the manufacturer develops the "machine-tender" instead of the mechanic. And, because they are able to get along with a smaller proportion of men skilled in all departments of the trade, employers sometimes take no apprentices, and thus dry up their supply of skilled labor.

In the shop the apprentice of today seldom learns his trade under the eye of the master, the owner of the shop, as he did in the past, until within a generation. Instead of a sympathetic and kindly master, who had a personal interest in the lad and charged himself with his instruction and development, he works as one of a roomful of men; the foreman feels responsible, not for the development of the apprentice, but for the profit to be made out of the apprentice's performance; it is likely to be, in his eyes, far more important for the lad to get skill in a few processes by which he can learn quickly to turn out profitable piecework, than to take all the exercises and learn most thoroly all the departments of his handicraft. The boy learns what he happens to, what he can pick up, and what is necessary to enable him to become, most quickly, a profit-producing member of the working crew. Under these conditions, with the probability that he will be able to learn only the fragment of a trade, is it strange that the boy is discouraged by the prospect, and goes into another line of work, or drifts about trying various forms of unskilled labor? And sometimes the regulations of trades unions prevent boys from entering upon apprenticeship. The rules of the union perhaps provide that only a certain number of apprentices shall be allowed, in proportion to the number of journeymen; the quota is full, and the boy must seek something else.

To meet these conditions which have arisen in our day, the trade school has been established and seems certain to become more of a factor each year, in the education of both boys and girls for at least the commoner skilled handicrafts.

Trade schools may be classified as of two general types: First, that type usually thought of when the term "trade school" is used in this country; a school equipped with all the requirements for work at the trade and manned by skilled teachers, themselves masters of the trade taught; a school to which a youth of proper age may come and learn all the things an apprentice should learn in order that he may take his place in the trade as a "graduate apprentice," or "beginning journeyman." Second, that type of school probably most commonly found abroad, a type often in the minds of persons who have traveled abroad when they speak of "trade schools"; a school to which apprentices learning the trade by that system, and even journeymen already practicing the trade, may come in the evening or during some hours of the day, and receive instruction in departments of the trade which they cannot get so quickly or so well in the shops, and also in mechanical drawing and in the knowledge of scholastic subjects which will make them better mechanics.

This latter type of trade schools, now successfully operating in a number of cities, is likely to be most easily established and less costly, and can be made to serve in the near future the youth of many cities which are not yet prepared for, or cannot at present afford, trade schools of the other type. The benefits of schools of this sort may be promptly realized upon

in the form of a supply of young mechanics of improved general quality in the community.

For the boy who desires to learn his trade at the school, as well as for that one who for one reason or another is excluded from an apprenticeship, the trade school of what has sometimes been called the American type supplies a very real need.

Along with many and marked advantages, such a school has some disadvantages in the teaching of certain trades. In some building trades especially, it will probably be necessary for the apprentice to have at least a limited experience on outside work, "on the job," before he is as self-reliant and resourceful as the lad who served his apprenticeship in the old way, before he is as able to put things together and fit into the general scheme, under the varying conditions in different buildings, the parts of the job for which his trade is responsible. But the boy from the school has the best instructors to teach him in all the branches of his trade and not only to teach him all parts, but the best way to do each particular thing; the boy trained outside does not by any means always have this. And the boy from the efficient trade school will more quickly get the necessary practice and expertness in making ends meet—adapting means to ends—than the "outside" boy will get the knowledge of reading and making drawings, of the mathematics that relate to the trade, and the general knowledge regarding it, which are rarely given to an apprentice in a commercial shop.

The trade school of this type does not give to any graduate the speed in certain trade processes which the "outside" beginning journeyman is likely to have. This, however, is a minor matter. Such speed is the fruit of repetition and practice; it is acquired in a few months—often in a few weeks. As soon as this is accomplished the trade-school boy is more valuable to his employer on account of his more complete and better-rounded training, and his superior general knowledge of the trade and its processes, and the principles which underlie it. The foreman of an important department in a great industrial plant recently said that, while trade-school boys sometimes lack speed on first leaving the school, the handicap soon disappears, and thereafter the balance lies in favor of the trade-school graduate. A large employer of labor has stated that, of two boys entering at the same time upon the learning of a trade, one devoting four years to a regular apprenticeship, the other, the two years usually required for a trade-school apprenticeship, and then going to work at the trade, by the time the shop lad has finished his apprenticeship at the end of four years the trade-school graduate is so universally superior that there is no comparison.

It was the fashion, when schools like the Williamson School of Mechanical Trades, the David Rankin, Jr., Trade School, and the Milwaukee School of Trades for Boys first came into notice, for skeptics to proclaim that such

schools could never teach real mechanics; the plant might look very nice, but skilled craftsmen could be made only by the old system. The experience of a few years and the showing made by the graduates of those schools have already dissipated these gloomy prognostications. The graduates get places. Sometimes the prejudice of foremen or employers makes it less easy than it ought to be, but all who want places get them. And after they get the places the trade-school graduates hold their own. The best proof of such a product is its satisfactory use under regular commercial conditions; and the employers of these young people have no question as to their value or to the success of the trade-school training. Only those who do not know continue to maintain that trades cannot be successfully taught in properly equipped and officered trade schools. In a few years this claim will be heard as infrequently as the claim that schools of medicine cannot properly educate doctors, or law schools fit lawyers for successful practice at the bar.

A good illustration of the money value of the training given in a good trade school is the showing made by fifty of the fifty-one members of a class (the fifty-first did not report) which graduated in March, 1910, from the Williamson School of Trades. Six months after graduation fifty members of this class, 12 bricklayers, 13 carpenters, 4 steam and electrical engineers, 11 machinists, and 10 pattern-makers, were earning an average wage of $16.60 per week. Incidentally it may be noted that all but one of the fifty reporting liked the trade, and all but two were working at it. Of these two, one, a carpenter, owing to temporary dullness in his trade, was inspecting material in an automobile factory, intending to return to work at his trade as soon as possible; the other, a pattern-maker, was working as draftsman. One year later, eighteen months after their graduation, the fifty were receiving wages averaging $18.05 per week. Another incident may also be of interest. Up to last April the Milwaukee School of Trades for Boys had graduated 12 pattern-makers, 12 machinists, and 10 plumbers. Of these thirty-four boys, 2 were working as draftsmen, 1 was working in a foundry during the dull season for plumbing, 1 was taking postgraduate work at the School of Trades, 1 was a student at the university, 1 in business with his father, 1 was just graduating; the other 26 were working at their trades. Of these the average wage of the ten pattern-makers, counting the same number of hours as in case of the graduates of the Williamson School, was $17.41 per week; the wages of the nine machinists was $17.89 per week; the wages of the seven plumbers, $29.43 per week. These twenty-six young men were earning an average weekly wage of $20.81. The average time these young men had been working at the trade since graduation was eighteen months. Only casual consideration of the matter is required to make clear to anyone how the wages of the graduates from these two trade schools compare with the pay of the average young man under twenty years of age who has entered

some unskilled employment to work with his hands. The Milwaukee School of Trades for Girls has been in operation a trifle more than two years and only seven graduates have been sent out; but some facts are already established. The girls from the school who have completed only a part of the course in millinery are in demand in the shops and wholesale houses at wages from 50 to 100 per cent higher than girls of similar age who are at work in various unskilled employments; girls who have only passed two or three of the six parts of the course in dressmaking are now able to go out and earn, either in dressmaking shops, or as dressmakers in private homes, wages that compare well with those of girls from the millinery department.

It is objected to trade schools that they are expensive, that is, more expensive than most other schools supported by the public. It is even alleged that it costs $200 or $300 a year to educate a boy in such a school.

Probably trade schools are more expensive now than they will be by and by, when plants are built and equipment installed, the most effective and economical plans of administration and instruction ascertained, a sufficient supply of well-prepared teachers at hand, young people and their parents educated to the value of the education which the schools offer, and the school plants filled so as to utilize them up to their capacity. But it may be that even a cost of $200 or $300 a year, for some two years, is not an exorbitant price to pay for the making of a first-class mechanic.

Someone has said that "to pay out $2,500 to make a $1,000 boy" is educational waste. Is it, if by "a $1,000 boy" is meant a boy who can earn at his trade $1,000 a year? I have recently been looking up some manual-training instructors. Several intelligent mechanics have applied for these positions. I have found that all of those who measure up at all to the requirements in their ability as mechanics are able to earn from $900 to $1,100 a year. Perhaps a skillful, steady mechanic is about "a $1,000 boy." If so, at 4 per cent he might be capitalized at $25,000. It is doubtful if the average unskilled laborer earns more than one-half of $1,000 a year. His earning power, say $500, if capitalized at 4 per cent, amounts to $12,500. If an investment of $2,500 in a couple of years would increase the capitalized value of a man by $12,500, it would not be so bad. But when that cost is not more than $600, and in two years can increase the capitalized value of a man's service by $12,500—more than twenty times the amount of the investment—is such an investment to be denominated "educational waste"? Instead of being rated as an "expense," money paid out for the trade schools ought to be considered as an investment; and if the school is managed with reason, and turns out a product of good quality, the investment should be rated as a good one.

The trade school is not meeting all the need of the community for vocational training; but it is meeting an important part of that need, and meeting it in an effective manner. It is meeting it, too, at a cost which is not unreasonable.

D. HOW SHOULD THE SCHOOL SYSTEM CONTRIBUTE TO AN INTELLIGENT CHOICE OF VOCATION ON THE PART OF THE PUPIL?

GEORGE PLATT KNOX, ASSISTANT SUPERINTENDENT OF SCHOOLS, ST. LOUIS, MO.

The limits of time and the scope of my paper do not admit of a discussion of the question: "*Why* should the school system contribute?" altho the temptation is strong to plead the advantages of the measures I shall propose, but I address myself at once to the proposition: "*How* the School System Should Contribute to an Intelligent Choice of Vocation on the Part of the Pupil."

The fields affected by the proposed activity are the child, the influences which make him what he is, and the life-calling which he is to follow. The public-school system is but one of the organized forms of society, and our problem is to minister to the need of the pupil intrusted to our care by pointing him as successfully as possible on his way. To accomplish the best results we must understand the child, be alert to all the other forces which influence him, know the facts of the vocations which he may enter and by continued instruction and sympathetic interest lead him to choose wisely and stimulate him to do his best.

We must not be content simply to direct the child, find a place for him, and launch him forth on his life-work, altho this process is easy compared with the better way. Our aim must be to bring the child to understand the real values in his environment and to detect the best opportunities open to him for a life-work, and then so far as possible lead him to choose intelligently which call he will follow.

It should not be our aim to determine for the child and his parent what he should do or into what vocation he should enter. Workers in vocational guidance should stand most firmly against the suggestion that we are to force the youth of our land into certain established occupations or trades according to a predetermined schedule or prearranged scheme. If we are true to our democratic ideals, we shall not permit any group of men or any authority to dictate what shall be the occupation of the child, nor should we ourselves make such an attempt. For any organized effort whatsoever to say that so many children may be taught a certain trade, or that this child may learn it and his neighbor may not, is a usurpation of function which must not be tolerated.

To choose wisely one's vocation, an appreciative knowledge of the immediate environment is essential, for altho there is so much movement today from place to place in the pursuit of a livelihood, the vital factors in the environmental conditions are really the same, even if they are more or less colored by geographical influences.

We must help him to understand the vocational opportunities open to

him. It is pitiable to what a large extent choice of vocation is made quite in the dark. If we can only give to our youth a fair understanding of the nature of the opportunities open in professional and industrial and commercial lines, we shall make a great advance over present lamentable conditions.

We must help the child to understand also the responsibilities involved in his vocational life, since they exercise so strong a determinative influence on his larger service as a citizen in a great democracy.

We must urge the value of preparation. One of the surest signs of a lack of wisdom in choosing a vocation is the evidence that the youth and his advisors lose sight of the far-reaching importance of adequate, patient preparation. This preparation should both precede and follow the choice of vocation. The choice will be much more intelligently made if preceded by studies in the relative values of vocations, while it is easily demonstrable both logically and statistically that after the choice is made time and effort devoted to preparation more or less specifically provided for the vocation chosen are most wisely spent. The general public does not see this, and it is a very large part of our opportunity in vocational guidance to lay emphasis on patient and wise preparation. This proposition rings true to the great thought of lengthening the period of infancy, and needs no championship on this platform.

We are not, in this paper, to discuss the propriety of the public school doing something, altho we know that we are hedged about by tradition and deterred by a certain sensitiveness arising from professional obligations fancied and real; we shall not concern ourselves with the feasibility of the scheme, altho we admit that we are restrained by legal rights and restrictions; we shall not stop to argue the question of its advisability, altho we are faced with a popular conception of the domain of the public school which is in many quarters very limited; we are set to consider what the public school *can* do and how best it should do it in spite of the charge so often brought against us that we lack initiative.

What, then, and how should the public school contribute to an intelligent choice of vocation on the part of the pupil?

In the organization of the work, very large attention must be paid to investigation, both preliminary and continuous. Investigation to be adequate must cover three great fields: the child, his environment, the vocations.

The child must be considered physically, mentally, and temperamentally, for not only is the welfare of the whole child at stake in this transaction, but the work will go astray if the factors which spring from these phases of child nature are ignored.

Investigation of the child may best be accomplished by enlisting both the judicious interest of the teacher and the trusting frank assistance of the parent. Neither the teacher nor the parent alone can make up a fair analysis of the characteristics of a child which will fit or unfit him for certain

occupations or professions. Ignorance of these characteristics is fatal to a wise choice. This work should not be haphazard and unorganized, but it must be made very definite and specific as to the points to be noted and the results must be made permanent and accessible to those who have a right to use them. This information should be gathered only by qualified persons and prepared and used only by competent parties. Efficiency is promoted by the employment of expert investigators who will secure from parent and teacher the information desired, but if this is impossible, at least the questionnaire should be prepared by the expert. With this chart as a guide, the teacher can evolve the information in conjunction with the parent. I wish it were my privilege to plead here and now for the propriety of placing this work in the hands of a public-school worker carefully chosen, who would bring to it the devotion of a teacher and the skill of a trained student of child nature, and at the same time be armed with the confidence of the public, without which there can be no large success.

Not only must the child be studied before he makes his choice of vocation, but he must not be lost sight of in case the school can hold him for better preparation. For the sake of the extremely valuable information to be gained only by experience, the youth who has passed out into his vocation must be carefully and persistently followed up, his successes or his failures noted, and his trials and efforts made a part of a record which shall guide those who later come to choose, to make their choice more wisely. For this work, a central office more or less specifically designated is desirable. It may be done by the principal of the school last attended, or by the teacher who knows the pupil best. The exact method depends upon the complexity of the school system, but the information is too valuable to be allowed to slip by unnoted.

Children who go to work by permit can be followed up by securing legal requirement upon the employers of such child labor that every case of discharge or of voluntary withdrawal shall be by them reported to some designated office. Such action also prevents the child thus quitting work from drifting about in idleness or loafing.

The environment must be investigated and should include a careful study of the usual factors: the home, the church, and the unorganized social influences. It may or may not be wise to have this portion of the study conducted by organized activities and made to take the form and nature of a general "survey" of economic and social conditions of the community. Such work is invaluable, altho it does not entirely meet the need of careful study of these phases of the environment of the individual child who is to receive guidance. A general survey conducted scientifically serves as the best basis for the rounding out and interpretation of the facts ascertained in the consideration of the individual case. We must have knowledge of the home conditions in which the child has developed. Are both parents living, are both present in the home and ministering to its

welfare, how many children in the family and how many already at work, the occupation of the father and other wage-earners, something of the nationality and school training of the parents, the present economic pressure bringing real or apparent need of early entrance of the child into his vocation, locality and housing of the home, its moral and spiritual tone, recreational habits of the family and of the child—these and other inquiries are most pertinent if the counselor is to assist the child understandingly.

Conditions of the church and larger spiritual influences on the child are commonly considered as outside the realm of proper inquiry, but careful consideration develops salient factors, altho they function indirectly.

Unorganized social influences have tremendous weight on the growing child. One scarcely knows where to begin. The street influences, in which all too often the child moves from school until bedtime, vary all the way from legitimate occupation, such as paper-selling, down to loafing and gang rowdyism. Then, the cheap amusement places claim their great army and with or without proper supervision our school children frequent popular amusements and absorb their not carefully chosen lessons so vividly presented.

A knowledge of the vocations is essential. The opportunities offered vary greatly with geographical and political influences reacting to make varying economic conditions, so that a study of the opportunities offered in one locality does not at all suffice for another community more or less distant. Here is where the local color comes in and necessitates a great amount of work before a fair grasp can be had on the problem. The points to be covered include the temporary and relative openings in the various professions and industries, and the conditions, physical and moral, which impose demands upon the time and strength and health and morals of the worker who enters. This investigation should include questions of wage, initial and future, of the opportunities of advancement to positions of commanding influence, the hours of labor, the sanitary conditions, with their effect upon the physical and moral health, the helps and hindrances in the opportunities for individual initiative and invention, and many other factors familiar to all who have watched the development of the problems in vocational guidance.

Present points of contact between the seeker and the opening offered must be investigated, such as the activity of employment agencies, official and unofficial, maintained from philanthropic motives or for private gain.

The provisions open for specific vocational training, such as professional schools of law, medicine, dentistry, etc., the so-called business "colleges" with their short-time courses, the plumbing schools, automobile schools, millinery colleges, dressmaking institutes, schools for the training of barbers or waiters, and the like, must all be critically examined and necessitate careful discrimination. Note must be taken of those occupations in which training is provided by the industrial concerns and by public utilities, such

as the telephone and street-car companies. Recognized institutions of college, university, and technical standing are, of course, most worthy, and the opportunities they offer must be included in a fair knowledge of avenues of training for the occupations.

All this material covered in my too brief survey must be collected by experts who are trained to see clearly and to judge wisely. It must be brought together, organized, and systematized also by experts. Further, it must then be recast into popular form so that those who are in immediate contact with the child—the teacher or the parent—shall be able to use this information effectively as tho it were a matter of their own investigation and knowledge. This organization and adaptation following after the investigation is a vital point, for it is a large part of the equipment of the counselor.

Before leaving this question of organization, we must consider the linking-up of the forces at work. There is room enough for all who care, but all the workers, philanthropic, official, and parental, should be organized and brought into co-operation so that there shall be no duplication of effort, no work at cross-purposes, no stumbling blindly in the dark when the saving information may be ready prepared, close at hand, and yet not known to the needy one. Here is one of the greatest points in favor of the organization of vocational guidance under the care of the public-school system, because without an authorized head to the work, the agencies interested fail of mutual appreciation and support and there is much loss of time and effort. With such an organization, the person in control not only gives specific direction, but communicates inspiration, disseminates information, and provides for the correlation of the workers as can be done in no other way. As I have said, there is room enough for all, but no effort should be wasted, and the energies can best be conserved and efficiency promoted by the single director who shall have behind him all the power and the prestige of the public-school system.

The complexity of the organization of the particular system must determine the specific office of this director. Whether the system be that of a state or county or of the rural schools, successful conduct of the work demands some *one directive mind*, who shall be able to see clearly the entire field of activity, and both vitalize the work and safeguard its efficiency. In the large system, the ability and strength of a director of vocational guidance will be severely taxed even with all of his time devoted to this effort, while under other conditions the county superintendent or school principal may well care for this in connection with his other duties.

Let us now pass to the consideration of the specific vocational guidance of the child. Simple direction or dictation may be accomplished in one interview, but not true guidance. Either the teacher knowing the child and informed about the vocation, or a worker knowing the vocation and informed about the child can in one interview accomplish much that is

desirable, but the guidance of the child vocationally is a matter of education as well as of information. Education takes time and involves training, and the preparation of the child for a wise choice of vocation can be done best by the schools.

Well down in the grades, even in the kindergarten, the life-work interest must be developed in keeping with the advancement of the child. Industry, commerce, and the arts are the sources of material, while number work and reading in the lower grades, arithmetic, geography, and history in the intermediate are the main processes thru which the child is equipped. Handwork plays a large and ever-increasing part in prevocational training. Supplementary reading and the library furnish rich food. The museum with its illustrative material makes its unique contribution. Classes from the schools should visit local industries, centers of trade and transportation, public utilities, etc., while from all these, and from the professions as well, competent persons should be secured to come to the school and there present vividly, either with or without illustration, the salient factors and conditions of their own vocation.

With all this material worked out in adequate methods and the teacher alive to her opportunities, even the child who must enter an occupation at the earliest permissible moment will leave the school with a considerable equipment for wise choice of life-work. Those who remain for the upper grades and the high school—and their number should be much increased when the life-motive is infused into all their work—will receive a larger view of vocational opportunities, especially looking toward the professions.

Such vocational content will be welcomed by the teachers, but its preparation must be accomplished by the supervisory office of the school system, preferably by the vocational director, who must be well trained in school work.

A further necessary equipment for wise vocational guidance is the preparation and dissemination of literature setting forth the facts secured by investigation. Some of the work already done in the gathering of material into printed form and published as charts and pamphlets has proven to be of greatest value. This printed information can never take the place of personal consultation between the teacher, the child, and the parent but it is essential as a preliminary source of information for teacher and parent.

Who shall serve as counselor to the child and parent when the time comes for decision? By all means the teacher, and by teacher I mean either the one in the classroom or the principal of the school, but in either case it must be one who knows the child, the vocational content in the course of study, and the material prepared from the investigations. It has been proposed to give over this personal consultation to an expert called in from the particular vocation, who, knowing the vocation, shall advise (and doubtless induce) as many children as possible during the visit. An address

to the students by such expert may be decidedly illuminating, but only one who knows the child can render the high service of properly guiding him in his choice of a life-work. As our school systems are at present organized, either the school principal should act as counselor or else a teacher in the upper grades who knows all the pupils and who is by virtue of the school work in closest contact with them should serve in this important capacity. In the high school, a carefully selected group of teachers may be given the work. Those teachers should be selected who *care most*, and who are temperamentally best fitted for this delicate task. For more is needed than simple advice—the pupil must be aroused, steadied in his choice, and then set on his way of preparation or, if it must be, inducted into the work with high purpose, clear vision, and large enthusiasm.

At this time of decision regarding the course to be pursued, the counselor should make every possible effort to urge upon the parent and the child the value of adequate preparation. One of the best results which it is hoped will accrue from vocational guidance is that children shall be held longer in school, and better still, with an added interest in their school work. Vocational guidance to be worth anything must, so far as consultation goes, be individual in character—one child at a time, with the parent in conference with the counselor. This process is necessarily very expensive, but if it results in markedly lengthening the school life and ministering to the school interest in the child, who shall say it is not worth while?

The conferences between child and counselor should be frequent, with the parent present at strategic times. The best place is the school building, the time to be arranged to suit the local conditions. In some schools, a vocation office is maintained with announced hours for consultation. For those parents who cannot come to the school or who are free only in the evening, opportunity must be offered for them to secure information and advice from the office of the vocational director who is in charge of the work thruout the system.

This central office must, in the nature of the case, be maintained by the public schools. From this office the work should be guided and the records of investigation should be kept here after they are prepared for use. It may well be the workshop of the experts in the preparation of the material gathered and the point of issue from which the investigators daily go forth in their work.

The teacher who is intrusted with the privilege of meeting the child in his guidance, vocationally, must add to a ready interest and abundant enthusiasm a certain amount of skill. While much can be gained from experience only, one of the strongest avenues of effective work on the part of a vocational director's office is the systematic training of the counselors, either by regular meetings or by repeated conferences, or still better by both. The directive head of the work should minister to the worker by a consistent course of training and a never-failing source of enthusiasm. The

counselors may well be organized into committees for mutual assistance, and general meetings for discussion of problems have proven to be of inestimable value.

Possibly thru the avenue of the interest of the child we can best touch the parent and enlist his co-operation. The parent must be reached, and only when we interest all those who have children in our schools and influence them effectively, can we feel that we are really occupying the field. Printed literature does much good if carefully disseminated. The vocational director can give splendid service thru enlightening the community and arousing enthusiasm by means of addresses, illustrated talks, and popular press articles.

Employers must be enlisted and their co-operation enjoined in vocational guidance. The experience of the workers who are already engaged proves almost without exception that employers are easily interested and are glad to co-operate, both for the help they can give and from the fact that their own welfare is advanced by such activity. This also requires careful planning and wise direction of the details involved.

The central office of vocational guidance, appointed and sustained by the public-school system, may or may not engage in the actual work of placing the child. The question of the maintenance of an employment bureau by this office is debatable, and with the advantages and disadvantages so nearly equal, no solution is yet ready. But the employment bureau either should be maintained by the school system, or, if by private parties, should be in some way absolutely under the control of the public-school vocation office. If the state maintains an employment bureau, it should work in harmony with this vocation office, either by legal enactment or by official agreement.

Either with or without an employment bureau, careful attention must be paid to "follow-up" investigation, as earlier outlined. Some of the most valuable information can be secured by watching closely and recording the careers of the individuals after they have entered their vocational life. Questions of permanency, of advancement, of adaptability, of advisability can best be considered in the light of information thus gleaned.

The great American public believes in its schools and trusts its school officials. Activity in vocational guidance will be welcomed by the community at large and it is easy and advantageous to organize committees of public-spirited men and women to co-operate with the school vocation office and give assistance which is invaluable in the way of advice, sympathy, and support. Here again local conditions must determine the form of the organization.

Finally, experience only will give us the wisdom best to conduct this work. I believe very strongly in the advantage of a central office maintained by the public-school system in which all parties at work in vocational guidance or in investigation leading thereto shall be sympathetically and

organically connected. True vocational guidance includes consistent training of the pupil in the school and at the critical times personal consultation with the sympathetic teacher his counselor.

Investigation, organization, co-operation, devotion: these four, and the greatest of these—devotion! The youth of our land call us to ever renewed effort in their behalf. The wide-open door of opportunity for us public-school workers is today labeled "Vocational Guidance." Let us thoughtfully, carefully, bravely, and devotedly enter in!

E. THE EDUCATION OF GIRLS

LORENZO D. HARVEY, PRESIDENT OF STOUT INSTITUTE, MENOMONIE, WIS.

A generation ago discussion waxed warm upon the question of the physical and mental ability of the girl to do the work prescribed for her brother in the higher educational institutions, in the same time and in the same way that he was to do it. The opening of the doors of these institutions to women on the same basis as to men, and the success of the girls in them, is a sufficient indication of the answer to that question. The discussion has practically been closed. The girl has demonstrated and is demonstrating her ability to achieve success in the highest fields of educational effort. But the settlement of that question has not settled the other—whether the girl needs and should have the same education as the boy. Until very recently, the organization of school systems, the framing of courses of study for elementary and secondary schools, and of the curricula of higher educational institutions have proceeded upon the assumption that the needs of the boy and the girl in education were the same, and to be met thru the study of the same subjects. These subjects were chosen and their scope determined almost solely with reference to the boy. It was left for the girl to proceed along the same line if she were to proceed at all. Some men and many women have argued effectively for the right of the girl to follow in the educational footsteps of her brother—until that right has been conceded. In recent years, the question as to whether this is the only right to education possessed by the girl has been coming to the front, until today it is one of the most important questions to be considered in connection with the development of our educational system. Some concessions have already been made—the introduction of sewing and cooking as subjects of instruction in many public and private schools is a slight recognition of the fact that the girl needs for her training something that has no place in the training of the boy.

The elective system in the higher educational institutions, coupled with the conservative admission of subjects that might be attractive to girls, if not to boys, and the election of these subjects by many girls, is a further recognition of this difference in needs. A serious consideration of the question discloses the fact that an adequate differentiation of the materials,

means, and methods to be employed in the education of girls and boys has not yet been made. We have been for years multiplying special, technical, and professional schools of varying aim and scope to fit boys and young men for the active duties in life, growing out of changed industrial, social, commercial, and political conditions. These schools have come into existence because of the demand for that kind of education which shall fit young men to do what, by reason of their manhood, they may do, and by reason of the requirements of society, needs to be done. Many of these schools throw their doors open to women, and a few women have availed themselves of the opportunity thus afforded. They have not proved attractive to girls in the same measure as to boys, for the reason that the world recognizes certain classes of work as peculiarly men's work, and other classes of work as peculiarly women's work. That some women and fewer men do not recognize this distinction does not alter the situation. If a woman conceives herself able to do the work which society at large has regarded as the work of a man, she has an opportunity to fit herself for it, and if she can find employment, she is at liberty to engage in it, but the fact remains that her entrance upon this field of activity is only an incident. With the man it is a life-work—with a woman it is liable to be interrupted at any time by the demands of her womanhood for home and family life. Few women have the physical and mental strength to meet the demands of the home life and the demands of a vocation or a profession outside of the home, and win success in both. That one occasionally does, is no warrant for assuming that it is a general rule. That she wins success outside the home at the expense of the home life is an admission of failure.

The immense broadening of the field of educational effort for men in recent years is not an accident. It has come because we have been studying the needs of the individual, of society, and of the state. We have been finding out what a man needed to know and do in order to measure up to these demands, and have been framing courses of instruction to more definitely fit men to do this work. We need to study the question of the education of girls seriously, and from the same standpoint. What a boy needs to know and to do to fit him for success in any of the useful activities of life upon which he desires to enter is the basic element in determining the character of his education. What a woman needs to know and to do in order to meet the responsibilities that come to her in life is the basic element in determining what her education shall be. There is an immense amount of work needed to meet the needs of society that a woman cannot do and ought not to undertake, but which a man can and ought to do and do well. He should be fitted to do this work. It is a waste of time and energy to try to educate a woman for that work. There is an immense amount of work needed in the world which a woman can do and which a man cannot do and ought not to undertake. The absurdity of trying to educate him to do the work for which he is unfitted by reason of his sex has been recognized, and

it has not been attempted. There are many lines of work needed to be done in the world which men and women may do equally well. Equal opportunities should be given for the education of each in the direction of efficient performance of these lines of work. In the lines of general culture and training, the education of men and women may be the same—but in so far as their work varies and demands special knowledge, differing in one field from that in the other, in so far as effectiveness in action depends upon special training required in one and not in the other, the necessity for differentiation exists.

Today we are realizing as never before the lack of efficiency in the vast majority of those who do the work that society demands. If the possible efficiency of the farming population were realized, the products of the soil now under cultivation in the United States would be increased at least 100 per cent. We are beginning to realize this fact, and hence the demand from all parts of the country for the sort of education for the country boy and girl that shall hasten the development of this efficiency. The manufacturers realize the inefficiency of their employees of every grade, and these employees, if they do not fully recognize their own inefficiency, see the lack of those kinds of educational facilities necessary to develop efficiency in their children, and they unite with the manufacturers in demanding a place for industrial education.

The great transportation companies are admitting the lack of efficiency among their operatives and are providing the educational machinery for securing it. Workers for civic and social uplift find themselves handicapped by the inefficiency of the agents thru whom they must work, and in response to their call for help, educational agencies are being provided to develop competent workers in these fields.

The impulse of this awakening to the call for efficiency is felt everywhere thruout the length and breadth of the land, and the demand is becoming more insistent every day for such a broadening of educational means and ends as shall make it possible for those who are to do the work that society needs to have done, to acquire the knowledge and training essential for efficiency in the doing. The demand is no less for the cultural element in education, no less for the highest professional and technical training for those who have the ability and inclination to secure it, but there is an added demand for the millions who have neither the ability nor the inclination to secure this training—a demand that educational effort shall be directed toward preparing these millions to do something well that needs to be done in order that they and society may both be benefited by their increased efficiency in doing. A narrow range of useful knowledge coupled with efficiency in its use is better for the individual and for society than a wider range of knowledge, useless or useful, without efficiency in action.

The home is the unit of society: within it are found influences and forces that are most potent in shaping the life of the individual, in deter-

mining the state of society and the character of the national life. From it have come the millions who constitute the population of this country. From it come every year more than two million new-born citizens. Within the next decade there will be born more than five times as many children as there were souls in this country when we became an independent nation, and two-thirds as many as there were people living in the United States when the Civil War began. Thru infancy, childhood, and early youth, the care and nurture of the individuals composing this vast army is a most important part of the work of the home. The physical condition, the shaping of tendencies, the character of habits formed, the mental and moral development of the child, the promise and potency of later life are influenced most profoundly, one may say are determined almost exclusively, by the influences of the home life. Are these influences and forces of sufficient importance to demand intelligent effort to prevent their being left to be the sport and play of ignorance or accident?

How much is involved in the two words *care* and *nurture* of the child! For its proper care, there must be intelligent action, and intelligent action must be based upon a knowledge and proper care of the physical organism of the mother and her child; of what is essential for both for the best physical development of the infant, and later, of the child considered solely as a healthy animal.

It is thought to be necessary for a farmer who would raise hogs or poultry successfully to study the structure and organism of each type, the properties of foods best adapted for their development, the preparation of these foods, the proper times for feeding, and the variety and amount of food to be given at different times and for different purposes. Few realize how much more difficult is the problem of feeding the child. It comes into the world perhaps the most helpless of new-born things. Of the two million children born annually, one in six dies before the end of the first year; one in three by the fifth year. Boards of health, physicians, and scientific experts who have investigated this subject unite in declaring that a large percentage of this death-rate is due solely to ignorance on the part of those responsible for the feeding of the child.

It is impossible to say how large a proportion of the illness of adults in the home is due to the same kind of ignorance—ignorance of what is proper in food, of what is proper in its preparation and care, and of what is essential in amount and kind to meet the varying needs of the older members of the family.

Connected with this single problem of feeding the family is another of no small importance, and that is the economic problem. The bearing of this problem on different members of the family is one of vast social and industrial importance. Proper feeding of the family, when no account has to be taken of expense, is a simple proposition compared with the proper

feeding, when at every moment the lack of money makes wise choice and proper preparation of food a much more difficult problem.

The health of the different members of the family as affected by other causes than incorrect feeding is a matter of vital importance. Knowledge of the proper means for the prevention of disease thru proper sanitary conditions in the home, proper care of the person, and of means for the prevention of bad effects from unavoidable exposure, immediate treatment in cases of accident, and the proper nursing in case of illness are essential for the proper discharge of the responsibilities of the homemaker.

Sanitary conditions in and about the home as related to heating, lighting, ventilation system, water supply, sewage disposal, and care of drainage system, are factors affecting the health of the family.

The clothing of the family, involving wise choice with reference to economy, adaptation to needs, durability, care, and pleasing effect, is another subject demanding a wide range of knowledge and skill in order to secure the best results.

The housing of the family, involving wise selection of furnishings and decoration, is another responsibility devolving upon the homemaker, requiring special knowledge of wide range in order to secure the highest degreee of comfort and æsthetic effect at a minimum cost.

The development of the child's mental power and spiritual nature while in the home, in such manner as to fix tendencies and develop characteristics essential for the best and most complete later development, is a problem that may well tax the mind of the wisest individual.

This is a brief tho fairly comprehensive statement of what may be regarded as the most important of the duties devolving upon the homemaker. That these duties may be discharged with efficiency is essential for the well-being of the home, of each individual in it, and of society at large.

Who is the homemaker? She is the girl who is to be educated today and who, as the woman of tomorrow, is to assume these responsibilities. The home is a universal institution; it is found everywhere; practically every human being has come from it, and has been affected for good or ill by its influence, its direct or indirect teachings. More than three-fourths of the women of marriageable age assume sooner or later the responsibilities of the homemaker. It is the one occupation which is most universal for the woman. The perpetuity and well-being of the race depend upon the maintenance of the home and upon the proper administration of its affairs. Practically every woman looks forward to the time when sooner or later she shall assume the responsibilities of the home, and, for the great majority of them, that time will surely come; and considering their importance to the race, it seems an inevitable conclusion that no education for the girl is adequate which does not take these responsibilities into account and

provide for such instruction and training as shall insure their effective discharge.

It is sometimes argued that the place for the girl to secure this knowledge and training is in the home. The complete and sufficient answer to that argument is that she does not there secure it, and that her mother is not competent to give such instruction and training, even if she had the time and inclination to do it, and if her daughter had the time and inclination to secure it. Every phase of knowledge indicated as essential for the proper discharge of the duties of the homemaker is capable of being organized for instructional purposes and it may be taught in the school. If it is not dealt with there, it will be dealt with nowhere in any adequate manner.

The woman's instinct is sometimes spoken of as a safe guide in all these matters, but in view of the results obtained, and in view of the truths of biological science, such a claim is too absurd for consideration. Not all of these matters have as yet been properly organized as pedagogic material, but this is rapidly being done. The great problem is to find a place in our present school organization where that work may be done.

It will doubtless mean the elimination of some subjects from the curriculum which girls have been required to study, not because the study of them best ministered to their needs, but because of tradition, harking back to the time when courses of instruction were organized for boys upon the theory of general culture and training.

We do not meet the situation by providing means for general culture of which at best only a limited number of girls can avail themselves. We recognize the need of special education of the masses to fit them to do something well. We are pressing vigorously for the development of this special education for efficiency in action in the agricultural, commercial, and industrial world, but we are practically ignoring the claims of the most important vocation in which human beings can engage and in which a larger number are sure to engage than in any other vocation that can be named. We hear on every hand the claims for special education for the eight million wage-earners, women and girls, to fit them to earn a larger wage and to better their social and industrial condition. Too much cannot be said upon this point and yet we are ignoring the fact that by the majority of these eight million wage-earners, the present vocation is regarded as temporary, a mere makeshift until the opportunity presents itself to assume the responsibilities of home life, and that for the assumption of these responsibilities they have had practically no preparation whatever. The woman is the homemaker, the wide range of activities demanded of her in this field of effort, the vital importance of these activities to all concerned demand special preparation which she is not now receiving. The welfare of society, the well-being of the nation depend upon the efficiency of the woman in the home, and that efficiency depends upon special education for such efficiency.

VOCATIONAL GUIDANCE

MEYER BLOOMFIELD, DIRECTOR OF THE VOCATION BUREAU, BOSTON, MASS.

Vocational guidance is not a new thing. What is new about it is the intelligent and energetic effort now going on thruout the country to organize such counsel, information, and safeguards as shall adequately protect the young people of our land during the critical passing from school to work.

The widespread interest in this matter of better bridging the transition period from the shelter of school life to the strange liberties of wage-earning indicates an appreciation of what is taking place and a deep-seated desire that the present waste shall cease.

At the time in life when our children most need watchful care and wise assistance a vast number of our boys and girls leave school in the various grades and take their plunge into working life.

There are kindly teachers, of course, whose personal help has started many a boy or girl up the ladder of success; there are homes which still help shape the future of the child. But nobody acquainted with the heavy professional duties of the modern teacher, the difficulties and the struggles of the parents, particularly in our cosmopolitan centers of population, and the technical complexities of modern commerce and manufacture, with all their specialization and subdivision, can for a moment believe that the chance advice and help of the average parent, teacher, or busy man of affairs is at all adequate to deal with the present situation.

That thousands of children drop out of school, thru no economic pressure, to go to work as soon as the law allows, we well know. An intensive study typical of what is going on everywhere is to be found in Volume VII of the United States Bureau of Labor reports on the women and child wage-earners in the United States. It is entitled "Conditions under Which Children Leave School for Work." This study of seven carefully selected towns in the North and South proves that only about one-third of the children who left for work needed to do so. The other two-thirds could have remained.

In many cases the parents have had no voice in this decisive step. Indeed, we all know of instances where the parents did not even know that their children had left school and were at work. If any fair number of those so leaving were in occupations where they could develop, learn something, amount to something, matters would not be so serious. But this is not the case. How can untrained and unguided children find their best opportunity? How can they possibly know where they are going to come out in a few years, there being nowhere at hand the information which can spare them years of drifting, waste, and too often tragic demoralization?

To understand an occupation from the vocational-guidance standpoint is no longer the simple matter it was in the days of Benjamin Franklin,

when his father took him on a round of inspection of shop, factory, and other workplaces in order to influence the boy's choice of a life-pursuit.

Were such excursions more common today, an inspection such as this would not necessarily reveal the facts one needs to have in order to judge an occupation intelligently. In the first place, consider that the making of a coat in a highly organized clothing establishment involves twenty-five and more different workers, each of whom is specializing in his own partial operation. This is true in the making of watches, pins, shoes, and other commodities; it is true in retail business, and it is the process now radically modifying professional pursuits.

But even an understanding of these subdivisions does not begin to tell the whole story. There is a growing literature on occupational diseases, industrial hygiene, public-health reports, actuarial statistics, and monographs dealing with the relation to the worker of certain operations, work conditions, fatigue, nerve-exhaustion, and general enervation. There is a considerable body of economic literature dealing with the changing demands of certain articles, and with the changing conditions and opportunities, the displacement of manual labor by machinery, of child labor by adult labor, boy work by girl work. There is a mass of social literature dealing with the moral influences of certain employments, their mental and ethical consequences. All these things and more need to be understood by somebody somewhere in order to end the present gambling in their own futures by so many thousands of our children.

Equally necessary is it to realize what the training should be for those who would enter the desirable employments. Nothing can be more misleading than the initial high wage often paid to the fourteen-year-old in occupations which take so much out of their young workers. Our studies in the vocations open to Boston boys prove that the occupations which hold out any future to their young workers often start them at a fraction of the wages paid where advancement is practically impossible. We further learn that the most desirable employments want better-fitted and more mature workers than do those which teach but little. Would not many parents sacrifice even more than they do could they be shown just where their children would come out after three or four years of work? Would they not co-operate with the schools in keeping their children longer under a system of training carefully planned to start their boys and girls on a higher plane?

Over three thousand families in Massachusetts told the investigators of the Commission on Industrial and Technical Education that they could afford to give their children vocational training.

Sixty-six per cent of the families investigated said that their children could have continued in school; 33 per cent of the children were found in unskilled industries; 65 per cent in low-grade industries; less than 2 per cent in high-grade industries.

This is not at all surprising. The boys leave for a job, not for a vocation. They leave one job after another, attracted by all sorts of reasons except that of fitting themselves for a life-work. This drift from place to place spells sheer waste to the employer, the child, and the community. And at the time of life when serious responsibilities of life begin these youth are unfitted for permanent and profitable employment.

If we need statistical evidence of the consequences of this aimless entrance into wage-earning, thru the only open door of undeveloping jobs, we need only read some of the evidence before the Royal Commission on the Poor Laws. There is unanimous testimony to the effect that the chaotic state of affairs which confronts the young people who drop out of school is daily manufacturing that most pathetic class of English poor, the unemployables. We have them here too; they are in the poolrooms and street corners of our towns, they are before the courts daily, they are crowded about the want-ad bulletins of the daily papers and drifting about the employment agencies, both public and private.

I have described only what is occurring among the fourteen-year-old children; among those who get their working papers as soon as they can. To a marked degree there is a similar want of plan and intelligent choice among high-school and even college students. Until the precious years of schooling minister more definitely and aggressively to the life-work interests of the pupils, until we awaken in telling form the motive and provide the material for a better launching into bread-winning pursuits, we shall see continued the present human waste.

What has vocational guidance to suggest as a practical way to cope with this situation? Every intelligent school official, parent, and teacher admits the value of scientific educational and vocational information. There is no argument as to the need of wise and well-informed assistance.

How shall we organize this most effectively? Doubtless there are more right ways than one for helping young people to find themselves, and I shall describe the Boston plan as a suggestion toward one way.

First, as to what we are not attempting to do. We do not prescribe or decide a particular occupation for anyone. This is the business of the parents and the natural protectors of the child at home. Decision must come from within and not from without. We are not trying to divert anyone from any class of pursuits or to direct particular attention toward them. It is not the business of vocational advising to favor or disfavor occupations. It is primarily its function to know the facts, analyze, classify, simplify, and apply them, where they will do most good. Let the facts speak for themselves, but drive them home. The responsibility rests on the shoulders of those who make the decision. But knowing the facts is no child's play, neither is their skillful dissemination.

In Boston we have made up our minds, first of all, that the public school is the logical starting-point for vocational advising. Here the best

preventive work can be done; here there is the best foundation for that co-operative decision in deciding upon a life-work which brings the various child-welfare agencies into service for the individual child. Moreover, the child is under constant observation here and family problems make themselves known in countless ways.

The first step was to appoint in each school some teacher or assistant principal as the vocational adviser for that school. This fixed a certain responsibility and made a point of contact between our vocation bureau, a philanthropic body, and the teacher. For two years we have met regularly to hear the best representatives of various trades and professions tell in an intimate way about their particular callings. Many questions were asked, and the notes taken by the counselors at these meetings were often used for classroom work. The range of employments thus presented has positively enlarged the teacher's visions of the world of work, and the child and its endowments are better understood thru this concrete study of occupations and the types of employers presented as speakers. In all cases the educational foundations for success in this or that pursuit were definitely brought out, and the close of the last school year showed an unusual amount of educational advising, counsel as to the kind of high school or other training opportunities to choose in order to advance in this or that desired calling. A wider range of choice, a wider sympathy with a larger variety of employments, has resulted. There can be no question that the work thus far has directly enhanced the appreciation of what more education could offer.

Supplementing this work we began to put into booklet form our studies of the typical vocations open to Boston boys. Here is concrete and practical material for choosing a life-work. Here is a navigating chart for youth seeking a port. Again the educational foundations of efficiency and success are clearly analyzed and brought out. So far from directing the children's minds away from school to work, the very opposite is the result achieved and intended. We join here with school and employer in helping to lift the boy or girl from a drifter to a learner. These booklets cover a number of points of interest. The Boston superintendents are now planning to incorporate this material into the regular courses under a heading to be called "Contemporary Boston—Civic and Vocational."

Actual placement is not yet attempted because it will take some years for these principles underlying vocational guidance to find themselves in such common practice that there will be little danger of opening the doors to a new form of child exploitation. Some time will be required to produce an adequate vocational survey of the community, and some time will be required before we can develop enough trained vocational advisers who can be intrusted to do this work on full time. In Boston we believe that the time has come for specially preparing those who are to serve the schools as vocational advisers. Thru Harvard University we are laying founda-

tions for a training course in this service. The Boston teachers as the result of two years of study and thought in this subject now recognize the need of a body of expert auxiliaries to do this particular work. Indeed they now openly and generally ask for the appointment of special counselors and the establishment of a vocational-guidance department. Note that this demand comes from within, from the rank and file, from the children's most devoted friends who want to co-operate and who realize the size of this task of counseling.

Three picked teachers from the group of counselors are detailed this year to give their time to the needed investigations preparatory to such a vocational-guidance department. One is planning a new organization of the employment-certificate department. The superintendent has assigned her to study the methods of granting working-papers. The thought is to do this work in a way to help the child who must go to work with advice, medical examination, and vocational information. This work will not stop here nor begin here. Back in the grades children who are likely to leave will be discovered and helped in every way to stay longer, or to continue their development if they do leave. The other two are investigating the careers of those who left in certain schools five years ago, and those now leaving and why.

Vocational guidance does not proclaim itself as a solution of all the serious problems confronting the child at work. But it has within its possibilities hitherto unused relationships between the employer and the school. The changes going on in schools are no more significant than are those in the field of employment.

How does the business man view this movement? More and more the public-minded employers are realizing that the high percentage of constant turn-over of employees, the incessant shifting and restlessness, are an economic waste for all concerned. While changes on the part of beginners often lead to slightly better pay and opportunities, in the long run the results do not indicate any substantial gain in the direction of permanent life work. Most of the drifters find themselves at the threshold of manhood at an *impasse*. To the industries which are learning the value of a permanent and progressive body of employees these continual replacements of employees count up in definite losses and inefficiency.

How about the dead-end or blind-alley occupations, which cannot provide in their operations for stimulus or development of any kind? Here we must stand squarely for the proposition that so far as law and public conscience can avail, no youth shall be permitted to suffer an arrest of growth because of industrial maladjustments. In these employments above all others, compulsory training opportunities must be provided during the only hours when a night school for the young should be in session—the daylight hours. In Massachusetts the State Board of Education is investigating the educational needs of working children between fourteen

and seventeen in certain typical employments where a large number of young people are in work not particularly educative.

Whatever may be the final solution, whether thru compulsory continuation schools, drastic reduction of working hours, improvement of work conditions, social scrutiny of employment, and the exclusion from all industry of the fourteen to sixteen-year-olds who are admittedly unprofitable to the employer in legitimate callings and unprofitable to the community in parasitical callings, we must hold fast to the proposition that no occupation shall "graft" on the service-resources of our youth.

We go to great pain and sacrifice to fit our boys and girls for the job; we want the job to be fit for the boy and girl. We want to give the world of work the best trained, best advised, and best prepared corps of workers we can turn out; we ask that this investment and this equipment shall be not ruined, even if not enhanced.

We stand with the employer in a demand upon the individual for efficiency; let it be social as well as individual. The employer will ask more and more of the school; the school will ask more and more of the employer. School life and working life must co-operate to make of the student an efficient producer, to make of the efficient producer a responsible consumer and a serviceable citizen.

THE SCHOOLHOUSE AS THE CIVIC AND SOCIAL CENTER OF THE COMMUNITY

EDWARD J. WARD, UNIVERSITY OF WISCONSIN, MADISON, WIS.

"This is going to make the neighborhood feel like home in spite of telephones, newspapers, trolley cars, and all the modern improvements."

He was a banker who spoke and the occasion was the opening of a schoolhouse as a social center in a middle-western city.

"When I was a young man," he went on, "back in Licking County, Ohio, folks used to meet like this in the old drab, weatherboard schoolhouse. We called it the 'Literary'; in some places they called it the 'Lyceum' and in some it was just 'schoolhouse meetings.' The old double seats weren't any too comfortable; the light from the kerosene lamps, with their tin reflectors, wasn't any too good, but there was a human spirit in those gatherings, a man-to-man frankness and democracy that *made America mean something* to us young fellows. And there was a spirit of neighborhood there—not only in the sociables, the spell-downs, and singing school, but in the meetings where folks just listened to speakers, and talked. Getting together about things we had in common, whether it was what kind of a bridge we should have across the creek, or the tariff, we felt a first-hand responsibility for being citizens.

"I came away to the city. I got into the scramble. I've been at it as

hard as anybody, and I've succeeded fairly well. But all the time there has been something missing. I know a lot of fine people, but I don't know my neighbors. I obey the laws and vote at election time, but somehow I don't get the *feel* of being a citizen. The fact is, I've lived here twenty years and it has never felt like home. But tonight when we're getting together, not as a party nor a sect, nor as a particular social set, but just as folks, as citizens, as neighbors, in this building which embodies the greatest of our common interests, that old feeling comes back, and as we go on with this —I tell you—even the city is going to feel like home."

Unlike most of the great significant movements in modern days, the movement to make the schoolhouse the civic and social center of the community appeals most strongly to the older, more conservative American.

The statesman, recognizing the fundamental importance of making the schoolhouse the citizens' common-council chamber, the working-center of an alert and self-informing common citizenship organization, welcomes this movement by as much as he recognizes the truth of Washington's words: "In proportion as the structure of government gives force to public opinion, it is essential that public opinion should be enlightened." And Justice of the Supreme Court Charles E. Hughes says, "I am more interested in what you are doing and what it stands for than in anything else in the world. You are buttressing the foundations of democracy."

The religious teacher—the priest, the minister—grasping the vital relationship between the leisure activities and the moral life of the community, welcomes the movement to make of the school building a common center of wholesome recreation. And we find not only that religious associations officially indorse the opening of the school buildings for use in the evening, but in many communities the chief promoters of social center development are the clergymen. For instance, in the little town of Stanley, Wis., the use of the high-school building as a "Peoples' Club House" came as the result of the united leadership of the Lutheran pastor, the Roman Catholic priest, and the Presbyterian minister. The Rev. Richard H. Edwards says, "It is unthinkable that the churches should oppose the social center movement."

The artist, recognizing that the worthy expression of the American soul in forms of beauty can come only with the cultivation and expression of music and the drama in an atmosphere democratic and free from the merely commercial motive, sees the vision of the use of the common schoolhouse as a democratic center of artistic culture and expression for the whole people. And Forbes Robertson says, "This is a program worthy of America."

School superintendents, principals, and teachers recognize that this movement to make the schoolhouse the comprehensive common center of the community means improved architecture, better equipment, more

vital interest, and increased support for the school in its present service. The National Education Association has unanimously indorsed this movement; and in a hundred communities school principals and teachers are lending their service in promoting community gatherings of one kind or another which look toward the full community use of the schoolhouse.

But not even the youth, for whom the social center means gymnasium, games, and club opportunities which otherwise he might not have, welcomes the social center with more keen appreciation and zest than do the older men and women in the average community, for to them it is not only an advance, it is also a restoration.

Two generations ago, in the average community in the Middle West, and quite generally thruout the country, the schoolhouse began to be used, not only as a center for the education of the children during the day, but also in the evening as a center of democracy, a center of recreation, a center of neighborhood.

Histories have to be rewritten continually as our viewpoint shifts from that which regards only military exploits as important, to that which emphasizes constitutional changes, and then to that which looks for industrial developments, and finally to that which gives full recognition to the social life of the past.

When an American history shall be written from this more intimate point of view, it will be recognized that nothing in our national life has done so much to foster the American spirit of democracy, of spontaneous community feeling and sense of solidarity as this free association of citizens upon the common ground of civic interest, of recreation, and of neighborhood in the schoolhouse in the early days.

Only in a time of social strife and strain can we fully value the common ties of civic unity and friendliness. It was at the verge of the Civil War that Lincoln used these words:

> We are not enemies but friends. We must not be enemies. The mystic chords of memory stretching from every battle-field and patriot grave to every living heart and hearthstone all over this broad land, will yet swell the chorus of the union when again touched, as surely they will be, by the better angels of our nature.

In those words Lincoln recognized, as the strongest force that made for unity, the memory of how the fathers united in the common cause of the nation's independence. If in the face of the straining social and economic problems of our time, of the divisive, separating tendencies, we take account of the uniting memories of democracy and good-will, there is none so powerful, so characteristically American, so all-inclusively friendly as this common tradition of how we used to get together in the schoolhouse evenings for spell-downs and singing schools, and for first-hand discussion of common problems. In this memory today is most vividly expressed

> the true democracy that batters down the walls that separate us from each other, the walls of caste distinction and prejudice, and hatred and religious contempt.

In this common tradition is brought to us

the proof that we are all of one blood, one bounden duty, that all these antisocial prejudices are as shameful as illiteracy and that they will disappear as soon as ever we shall come to know each other well.

The schoolhouse in the simple primitive community began to be the focal center of the common life. But as the community grew older, and especially as it grew more populous, there came in the wedge of division, of separation, of specialization.

Instead of assembling to talk about political questions as matters of common interest, we separated into mutually antagonistic partisan organizations. We gave up the use of the schoolhouse as a citizens' common-council chamber. We gave up the common ground of friendly man-to-man understanding in politics. We gave up the real headquarters of popular government in a democracy. And instead of meeting to reason about and understand politics, as "the science of government," the field of common interest, we have made that word synonymous with partisanship.

We separated also in the pursuit of pleasure and the use of leisure. We formed the specialized library and art gallery, the specialized dramatic center and music hall. Failing to develop our recreational life as a community expression, by expanding the use of the schoolhouse where it began, we gave over our recreation largely to commercialized exploitation and the wholesome play instinct became the prey of the saloon and the vice resort.

And with the civic cleavage and the recreational diversity, came the utter break-up of our community social organization and we went apart to satisfy our outreaching friendly instincts by various sorts of exclusive cliques and circumscribed brotherhoods and fellowships. Abandoning the use of the schoolhouse as a common social center, we lost the power to think in terms of the community, the very word society became restricted in its use, and we began to develop pride in the myopia of exclusiveness.

In other words, we yielded to the centrifugal force which flung us apart in the following of special party leaders, the pursuit of special recreational interests, the development of special association tastes, until these things which would have been the means of binding us together and unfolding our unity, had we kept them in co-ordination, have become means of our separation, our mutual exclusion and misunderstanding.

So, from being a common civic and social center, this community building became simply the education place of the children.

If instead of abandoning the civic, recreational, and social evening uses of the schoolhouse by adults and older youth, these uses had been promoted and developed and the use for the children had been given up, we would be wise to ask whether this common social machinery half used would be doing its full service, just as, having developed the children's part of this building's use, we are beginning to ask whether this half of a community institution is making good.

A few years ago, before the Connecticut State Teachers' Association, President Eliot said that compared with what was hoped would result from the establishment of the common school, this most important of all our institutions is a failure, and he gave a catalog of some ten of the common evils of our time, which the public school fails to right. These evils may be grouped under three heads: misgovernment in place of intelligent democratic efficiency, dissipation and idling in place of constructive use of leisure in recreation, cleavage and class feeling in place of social order and public spirit.

This is a tremendously serious charge, for the distinctive success or failure of America lies in our efficiency or failure in collective self-government, our waste or good use of free time, our capacity or failure to weld a harmonious whole out of the varied elements of our population and to produce a race of socially conscious men and women, the maxim of whose choices shall be the common good.

But before we lay the blame for failing to develop citizenship capacity, power for better use of leisure, and social consciousness upon the teaching of the children in the schools, it is well to see whether the public school as simply an education place for the child is not so limited in its essential nature that it cannot meet these needs.

The public school as an institution for the education of the child has, of course, its great service to perform, than which nothing can be more important, but granting all possible improvement in personality of the teacher, in equipment, and in method, the public school as an education center for the child does not and cannot meet these civic needs.

The public school as simply an education center for the child does not and cannot produce "good citizenship," for in its nature as such it is and must be a monarchy, a place of training in obedience. We may veil and soften the authority into the most careful fostering guidance, as Froebel did and as Madame Montessori does, but the authority must be there and the law of the school must be obedience. Now "good citizenship" is more than obedience. Good citizenship in a democracy is the consciousness of responsibility not only for obeying the government, but for participation in *being* the government.

It is only thru the use of the school building as a civic center, that is, thru its use as a citizens' council chamber, a legislative assembly place, and a final supreme court room, that this common institution can serve America's greatest need in the development of a positive consciousness of democracy. Years ago, John Stuart Mill said, speaking of such public association on a common ground:

> Where this School of Public Spirit does not exist scarcely any sense is entertained that private persons owe any duties to society except to obey and submit. There is no unselfish sentiment of identification with the public. Every thought and feeling, either of interest or of duty, is absorbed in the individual or in the family. The man never thinks of any

collective interest, of any objects to be purchased jointly with others, but only in competition with them, and in some measure at their expense. A neighbor not being an ally nor an associate, since he is never engaged in any common undertaking for joint benefit, is therefore only a rival.

This responsibility for the use of the schoolhouse for the development of civic capacity cannot be shouldered off upon the child. We shall not cease to regard the government as being located at Washington, at the state capitol, or at the city hall—we shall not get the democratic point of view and sense of responsibility except as we make the schoolhouse the headquarters of an organized citizenship where men frequently assemble to discuss together and with their public servants the problems of democracy.

Not long since, President Taft spoke before the "Ohio Society" in New York City against the proposed placing in the hands of the citizens of the power to recall the judiciary. No doubt President Taft would agree with Lincoln when he says: "Why not repose patient trust in the ultimate justice of the people? Is there any better, is there any equal hope?" But as President Taft said, the difficulty is that the people have (or rather use) "no machinery" other than the partisan irresponsible newspaper and the biased appeal of the orator, for determining how they shall act. The schoolhouse as a center of civic discussion offers such a "machinery" as is needed to develop intelligent public opinion. "It is no exaggeration to say," says Henry Campbell, "that in making the schoolhouse the forum of the people lies the chief hope of perpetuating the republic and perfecting its institutions." The legislature of Wisconsin has recognized this fundamental civic use of the schoolhouse as a center of democracy, as a right of so great importance, that the school boards are required to make provision for this use. And this great function of the schoolhouse as a foothold of democracy, a handhold upon government, a working-center of citizenship cannot be met by the school as an education place simply for the child.

Second only to the need of developing the citizens' capacity for intelligent government, in the great enterprise of America's making good, is the development of a strength-building recreational life, "the capacity to have fun without doing wrong."

Francis H. McLean, after a year's careful investigation of the community needs in many parts of America, placed as first in importance the need of wholesome recreation. Does the public school simply as the education center for the child tend powerfully toward the supplanting of vice and dissipation by constructive recreation and toward the free devotion of surplus energy to beautiful expression?

The public school as simply the education center for the child does not and cannot meet this need, because in its nature it is restrictive. The child in the school is not free to do wrong. The attendance is compulsory. There is little or no training in spontaneous play expression.

On the other hand, the opening of the school building as a center of

entertainment to which one is free to come or not as he will, the fostering there of the individual's free self-realization in recreational activities, in musical and dramatic expression, does directly and powerfully meet this need.

In the city of Milwaukee, up to a few years ago, Schlitz Beer Garden on Vliet Street was a popular and much frequented resort. Today if you go there, and, entering the old beer hall, go up to the bar, put your foot on the rail, and ask for something, you will receive a book from the branch public library. Why the change? Simply because the city has begun to furnish music in the parks. Formerly when a man would take his family to hear good music, he went to the beer-garden. He paid the wet tax, not because he wanted the liquor, but because he wanted the music—and that was the price. When music was furnished free in the public park, he went there. The beer-garden ceased to be profitable and was sold at a low figure to the city.

The time of greatest need for recreation opportunities is the time of greatest leisure, the evening. When every schoolhouse is equipped with gymnasium and baths, with bowling alley and games, with music and other forms of entertainment for the evening, the property of the evening dissipation places will be "for sale cheap." And when, as in Richmond, Ind., the community provides the services of a musical director, and as has been begun in New York City, the services of a dramatic director, to develop in the school buildings the latent orchestral, choral, and dramatic resources of the communities, the level of leisure activities, the recreational taste, and the moral character of America will be raised.

There is a phase of this service of the schoolhouse as a recreation center which has a fundamental bearing upon the most vital problem of the future of the family in America. Here is possible the acquaintance, under wholesome environment, of the young men and women who will be the fathers and mothers of the next generation. Today there is for very many no such recreation place which is at once free, attractive, and wholesome.

This common need of elevating the recreational life of the community, the schoolhouse as a center only for the education of the child, does not and cannot meet.

And finally, does or can the public school, used simply as an education center for children, develop that social consciousness, that breadth of human sympathy, that sense of solidarity and power of collective action upon which all those who do not accept the doctrine of "the class struggle" base their hope of human progress?

The public school is a socially supported institution, and yet as a children's education place it is individualistic in the tendency of its training. The main lines of conscious influence, obligation, and responsibility do not run horizontally from child to child, but perpendicularly from the teacher to each child. This is necessarily the case. So long as children are under a

teacher, and, of course, so long as children are children they must in school be under a teacher, the chief feelings of interest and loyalty will be directed upward toward the teacher, rather than outward as social feelings. Moreover, the whole development of child study is the consideration of the child as an individual, and the main tendency of its training is to develop the child's capacities and powers as an individual.

The individualistic training is vitally important, but it is also vitally important that there should be training in, or at least an opportunity for, the development of the community spirit, the social consciousness. The community building used only as an education place for the child is a paternal training-place. Used as a gathering-place for adults for self-education through discussion, recreation together, and acquaintance, it is a fraternal training-place. Both are necessary; each supplements the other, and neither can take the place of the other.

The possibilities in the development of the social consciousness and the power of united action, for whose unfoldment the use of the schoolhouse as a social center makes way, were suggested by Governor Wilson in these words:

> It seems to me that what is going to be produced by this movement—not all at once, by slow and tedious stages, no doubt, but nevertheless very certainly in the end—is, in the first place, a release of common forces now undiscovered, now somewhere banked up, now somewhere unavailable, the removal of barriers to the common understanding, the opening of mind to mind, the clarification of the air and the release in that clarified air of forces that can live in it, and just so certainly as you release those forces you make easier the fundamental problem of modern society, which is the problem of accommodating the various interests in modern society to one another.

The school as a center for the education of the child tends to unfold individual capacity; it does not and cannot awake the dormant social possibilities of a concerted life.

The movement to make the schoolhouse the civic and social center of the community, is, however, not by any means merely the result of the observation on the part of the educator, that the present service of the school is inadequate as a training-place for democracy, for better use of leisure, and for social consciousness; and the decision, following that observation, that the schoolhouse shall become the civic and social center. To be sure this is an important factor, and the welcoming of this movement by school men will help to hasten its realization. But the fact is that the movement to make the schoolhouse the focal center of the community has itself the character of the institution which it aims to develop. That is to say, the social center movement is a focalizing of many movements whose aim is the public welfare.

Men and women form local or national organizations to promote the public welfare along various lines. They work away at their special problems for a while. Then they make the discovery that, with communities as with individuals, that which is really beneficial is not what is done

for one, but what one does for himself, and that the wider use of the schoolhouse offers the convenient, economical means whereby the community can secure for itself the improvements in which they are interested, or by this means the community can protect itself against the evils they are fighting. So the members of one of these organizations start to agitate for the opening of the schoolhouse, and when they do they usually find that other associations working on other lines of public service have made the same discovery.

The fact that eleven different organizations, of various sorts, united to secure the opening of the schoolhouses in Rochester, N.Y., is an illustration of this gathering of forces into a common movement. This is typical of this movement thruout the country. It is a focusing of the efforts of various organizations which aim to promote the public welfare.

For instance, in nearly every community there is a group of men in whom the spirit of revolt against corruption becomes aggressive. When evidences of "graft" appear the first impulse is to catch somebody and put him in jail, and for a time that seems the final remedy. After a while, however, the men who are engaged in this pursuit begin to dig down to find the cause of the condition, and Mr. A. Leo Weil, the prosecutor of the recent graft cases in Pittsburgh, sums up his study of the whole subject by saying that "the indictment of grafters is the indictment of the community." Then he points out the cause in the condition since we left the use of the schoolhouse as a center of civic expression. "With the *increase* of official business there has come to the individual a *decrease* in the opportunity to participate either by the expression of his will or of his opinion, notwithstanding the greater necessity for such expression." So in Buffalo, William Wright, who in that city and in the state legislature for years has fought the corrupting influences of special interests, turns to the schoolhouse for the remedy: "The men who have special interests get together to look out for their special interests. Only as the citizens get together and organize to look out for their interests will the public welfare be steadily protected."

Wherever "reform" movements reach the constructive stage, they tend to become factors in the movement to make the schoolhouse the civic and social center of the community, for their leaders recognize that this is the means of securing that civic health thru civic exercise which will fortify the body politic against disease. Judge Lindsey says: "We have been fighting the beast; you [social center promoters] will make the dirty animal impossible."

Not only the fighters against political evils, but those who are interested in various specific measures of improvement, are turning to the idea of the establishment of the use of the schoolhouse as a citizenship organization center and civic forum. Whether the improvement projected be the adoption of another form of government for the city, the approval of a city plan, the matter of a bond issue, or some other special measure, the men

who seek to wake their communities to take some action of civic improvement are coming to recognize the benefit and the saving of energy that would come if there were the opportunity to present the proposed measure for discussion in established community civic forums; and these men combine their request with that of the "reformers" to open the schoolhouses.

The uniting of the religious and moral leaders of the community in urging the opening of the schoolhouses for clean evening recreation has been spoken of. In one city, during the past year, a leading clergyman said:

> Some time ago, when I began to recognize the need of a recreation place, especially for the young people, I thought of building a parish house in connection with my church. I then thought that it would be more economical to unite forces with others in the building of a Y.M.C.A. Today I see that the money that a Y.M.C.A. plant would cost would go very much farther and benefit a hundred fold more people if it were devoted to the equipment, supervision, and opening of the schoolhouses for physical training, club work, and entertainment.

The Playground and Recreation Association of America began with chief emphasis upon out-of-door recreation facilities, but it is now actively promoting the opening of the schoolhouses for wider use. Dr. Luther H. Gulick, the first president of that association, has showed his perception of the fundamental significance and need of the social center in these words:

> Only upon a basis of personal understanding and mutual confidence is efficient and coherent social action possible. This is the foundation of democracy. Communities must have, therefore, material and social machinery by which various classes shall come to know each other; some instrument that shall cross-section racial, financial, and social strata; something that shall go beneath these and touch fundamental human interests. . . . . The machinery most natural, as well as most available, is the public-school system.

But not only do these and other organizations which are formed to promote general civic, moral, and recreational improvement unite in indorsing and advocating the opening of the schoolhouse as a community center. There is also the active indorsement of those who are engaged in various specific forms of public service. In nearly every city and town the public library stands ready to co-operate by making the schoolhouse a neighborhood branch library. This is now being done in Grand Rapids and other towns. The co-operation of the Richmond Art Association is back of the movement to make the schoolhouses of that city neighborhood art galleries. The movement to make the schoolhouse a community music center has back of it the interest of such men as Walter Damrosch. The National Board of Censorship of Motion Picture Films is promoting the idea of making the schoolhouse the neighborhood motion picture theater. In some cases organizations co-operate in maintaining special extensions of the use of schoolhouses. For instance, the Rochester Dental Society maintained the service of the first dental office to be opened in a schoolhouse in that city. Of course the societies formed to promote the public welfare in rural communities are practically all in agreement with the recommendation of the country life commission looking toward community center development in the country.

But the social center movement has its roots deeper than the recognition of its need on the part of students of public problems in America. It is the expression of the great fact that the tide has turned. The dominant force of this century is not centrifugal but centripetal. We have passed the time of social analysis and are entered upon the time of social synthesis. As Dr. Elmer E. Brown puts it: "The very forces that have been drawing us apart into groups and classes have been making us sick of artificial separations." Little Jack Horner is growing up, and he no longer regards it as praiseworthy to pull a plum from a pie while he occupies a seat in the corner. For fifty years we have devoted our best energy to the construction of a fabric of machinery by which things would work together for good. We are now turning to the development of machinery by which folks may work together, and think together, and enjoy together for good. And the social center movement is assuming the force of a practical American common-sense idea generally held.

There is not space to deal at length with the question of administration. The National Education Association included in its resolution indorsing the social center movement the statement that the administration should be kept in the hands of the constituted school authorities. Obviously, this points the necessity of the school board or trustees having a comprehension of the values in the use of the schoolhouse as a center of democracy, a center of recreation, a center of neighborhood, as well as an education center for children.

The cost to a city of having a school board which does not recognize it as a duty to allow and encourage the largest possible community use of the schoolhouses is illustrated by the experience of Chicago. Twenty years ago, the Chicago School Board refused requests to allow the schoolhouses to be used for evening club activities and recreation. The movement to make provision for community social and recreational needs was then turned to the building of special community buildings to meet these needs. Since that time, Chicago has spent nearly twenty million dollars in securing these duplicate plants. Had this amount of money been devoted to increasing the equipment and developing the use of the existing community buildings and grounds, instead of having seventeen of these recreation centers, the city of Chicago would have an adequate community center developed in each district in the city, and its school system would be a model.

But today the average school board would not take such a stand. On the contrary, there are many school boards whose members recognize the possibilities and benefits of social center development. For instance, Mr. Joseph Scott spoke not only as one of the counsel in the McNamara case, but also as president of the Los Angeles school board, when in an address before the Southern California Teachers' Association, just after the confession, he pointed out that the problem of industrial control is the problem of this century, than which there is only one greater; and this greater

problem is, whether in the solution of the economic question we shall preserve our civic unity and our common-sense of justice and good-will, our fundamental human friendliness, and, said he, the possibility for the right solution of this greater problem lies chiefly in the use of this community institution—the school.

It may be said that the responsibility for promoting social center development lies back of the school board, that this body as a rule has no funds for this extension. In view of the fact that the school board is, in most cases, free to make out its own budget, it has within its hands the power of correcting this lack, and as a rule is able to make a beginning with funds in hand.

The first step is, of course, the engagement of a man as an assistant to the superintendent, to take charge of this field of the wider use of the school plant. The average superintendent has his hands full with the regular work of the school. This office is that of a social engineer. The man who occupies this position should, in the first place, be familiar with the beginnings that have been made in social center development thruout the country. He should grasp, of course, the idea of the use of the schoolhouse as a center for community organization of citizens, for this organization is the democratic foundation of the social center. He should recognize that he and his assistants in the various neighborhoods are not teachers, but servants of these neighborhood civic clubs, aiding in the preparation of programs, the work of publicity, and otherwise serving the owners of the buildings. He should be familiar with the methods found successful in the use of the schoolhouse as a lecture center, as this has been developed in New York and other cities. He should know the experience of Los Angeles, Worcester, and the other towns which use the schoolhouses as polling-places. He should be familiar with the use of the schoolhouse as an art gallery and music center as it has begun in Richmond, Ind. He should know the use of the library as it is in Grand Rapids, and should grasp the possibility of making the librarian's desk the local employment office and information bureau as this was begun in Rochester. He should be familiar with the school museum system of St. Louis. He should know the methods of boys' and girls' club organization worked out, for instance, in New York. He should be familiar with the gymnasium equipment and methods of direction which have been found satisfactory in Cincinnati, and he should know the various methods in the recreational use of the schoolhouse as these have been developed in New York, Chicago, Columbus, and other cities.

But the man who is qualified for this position must recognize that the beginnings that have been made are only fragmentary and that the opportunity in this field is for constructive pioneering.

The training for this position should, of course, include an understanding of the technique of the school in its present use, so that there may be a correlation between the day and evening use of the community building.

He should, of course, also have a thoro practical grounding in sociology But while the work of a social engineer is like that of a mechanical engineer, or a civil engineer, in requiring technical knowledge for efficiency, unlike these, it chiefly demands qualities of personality.

Obviously, the first requirement of the head of a staff of social center secretaries, boys' and girls' club directors, gymnasium directors, librarians, musical and dramatic directors is the capacity for organization and selection.

Some materials are conductors of electric currents and some are non-conductors. Some men are conductors and some non-conductors of social currents. A social engineer is a human being serving other human beings as a "social missing link." He must not only be common in his sympathies and understanding, free from all pettiness and bias; he must also be a "conductor."

But above all he must have the consciousness, and be able to inspire in his fellow public servants in this work the idea of *social service*, not at all in the usual sense of these words, but in the frank recognition that he and they are the hired men and hired women of the people who pay their salaries.

And finally, he must have a grasp of the social center idea in its big significance, that deep significance which was suggested by the banker quoted at the beginning of this paper, in the words, "This is going to make the neighborhood seem like home."

For this is the fundamental significance of the social center movement.

The education of the child is a family function. The man and woman began to be human when they got together for the education of the child. It was thru their association together upon the common ground, and under the common roof of the child's education that they learned co-operation, mutual consideration, affection. It was thru their association together upon this common ground under the common roof, consecrated to the education of the child, that they learned to think in terms of each other's welfare, that they developed the home feeling within the little unit group of the family.

Now, out from the household have gone the industries and the arts, out into the street and shop and store. And out in that realm the rule is *caveat emptor* and suspicion, and selfishness. We have not learned to think in terms of the larger group. But out there in the public school is that claim-stake of our faith that the larger group of the neighborhood has in it the potential quality of a household. Out there is the education of the child. As we get together under that common roof, upon that common ground consecrated to the education of the child which made us human in the smaller group, we shall develop, thru association and acquaintance, the household sense of common interest, of mutual consideration within this larger group, which will make the neighborhood, even in the city, seem like home, not only to the old folks who remember how we used to do, but to all of us.

Only as the social center movement is organized and developed in a spirit true to the democracy, the freedom, the all-inclusive good-will and tradition of the "way we used to get together back home," will this development fulfill its promise and be worthy its place as the characteristic institution of America, an efficient means for fundamental human progress.

THE BOOKMAN IN HIS RELATION TO THE TEXTBOOK PROBLEM

FRANK A. FITZPATRICK, MANAGER, AMERICAN BOOK COMPANY, BOSTON, MASS.

The textbook publisher in this country is of comparatively recent origin. He came into existence when schools began to demand that every pupil in the same class should use similar textbooks. Dealers in school furniture, heating, ventilating appliances, and school supplies developed as industries somewhat later. Seventy-five years ago in New England, outside of a few cities, schools were greatly hampered by their inability to require and procure uniform textbooks. As the West developed, settlers brought with them their old schoolbooks, and trouble and confusion resulted therefrom in the schools. The practice of giving an exchange price for old books was a concession on the part of publishers to aid the school authorities in getting out of the hands of pupils the diverse textbooks in the schools, which, remaining in the community, made classification impossible. The entire volume of the textbook business of every grade and description in the United States and its dependencies is under rather than over twelve million dollars per annum, divided among more than one hundred publishers. Briefly stated, the cost of textbooks of all kinds in any town or city never exceeds fifteen cents per capita of the population in such community.

Publishers advertise their new and forthcoming books in educational journals, in circulars, by mailing books free as samples to thoughtful and able teachers, that school authorities may know these books and ascertain for themselves the merits of the plans therein presented. When some publishers have sought to limit this advertising expense by cutting their number of donated sample copies, they have been so deluged with letters from teachers and school officials threatening them with loss of future business, that this expensive advertising practice still continues. Yet these agencies are feeble in comparison with personal presentation of the merits of a textbook by a skilled and tactful bookman.

A textbook first appears in the method of treatment of some excellent teacher in the schoolroom—friends, visitors see its merits and get in that way some of the ideas. The next step is to ask for all phases of the treatment, i.e., have the teacher write out a copy of his presentation. This finally becomes a serious task and the author works out his plan in detail and presents his manuscript to some publisher. It is criticized by editors,

referred to other critics, its adaptability considered—and accepted. His manuscript may be rejected; neither editor nor readers may get the idea or thought of the author; because the author's ideas run counter to the views of those who read the manuscript; because the manuscript is believed to be so contrary to prevailing usage in the schools that the sales would be small. In the beginning, authors and founders of publishing houses were both printers and salesmen. When Professor Davies, of West Point, wrote his series of arithmetics he found a publisher in a young man, the founder of a great business, who took the risk of printing, and personally canvassed teachers and boards of education. As business increased, it became necessary to delegate the sale of textbooks to other hands than those who wrote, published, or printed them. To market a new idea, or article, salesmen of a special character are needed. They must be able to demonstrate the value of this article. To sell a new type of locomotive, its merits must first be explained to officials; its advantages must be pointed out to engineers who will have charge of it; future orders depend upon the way the new engine stands the tests made by the railway people.

The general introduction of music in the schools is largely owing to the personal efforts and demonstrations, years ago, of two bookmen, who, against great indifference on the part of school officials and more skepticism, in frequent contests with each other and others, proved that music could be taught just as other subjects. Similar services have been rendered to the schools in their time by many other bookmen. At present, any new idea affecting the schools, their well-being, such as results from better heating, lighting, ventilating, must be virtually taught and demonstrated to school officials and authorities by the representatives of such industries, much the same as other topics are taught in the schools and in the world. The commercial world thus becomes an important factor in bringing about better conditions. In a recent article Professor Duncan quotes a famous chemist, Professor Bernhard of Paris:

> Former discoveries of mine I gave to the world and they have practically died. The last one I have patented because only by making it an object to some commercial interest to make it, can it be brought to man's attention and the world benefited.

An article that anybody can make, a book not protected by copyright, is not likely to be made by anyone. Any publishers can publish the great debates between Lincoln and Douglas. The copyrights on numerous books of great literary value have long since expired, but if you want to purchase a copy, the only place that one can be found is probably in the stock of the dealer in second-hand books.

The bookman, in his first relation to the schools, exists, directly, to point out and exploit the aims and methods of the author of the textbook that he is trying to sell; indirectly, to help the schools thru betterment of methods of teaching. For these purposes he needs opportunity to lay his facts and points before teachers and superintendents; otherwise, it might

be months and years before these busy people would discover what this author has to tell them. The cost of textbooks of all description does not exceed 3 per cent of the appropriation for running expenses of the schools. Yet to the pupils in the schools it may be a question of 50 per cent of their time and opportunities, to have this problem thoroly studied and solved, to the end that the tools used by them shall be of the best quality and latest pattern. Therefore, teachers and superintendents must and do take all the time that they can spare from their other duties to acquaint themselves with the contents, methods, and aims of textbooks.

The bookman, coming into contact with the schools at various points, is quick to find excellent teachers, teachers with inventive minds, and to encourage them to express their powers in the line of authorship. Thru the bookman a very large number of the best textbooks come to be written and published. He is, therefore, an important factor in the growth and maintenance of good teaching and the consequent uplift in the schools, even tho the immediate results of his work are not so visible as those resulting from the efforts of others. Another function of the bookman is to secure and insure a high quality of workmanship in the manufacture of textbooks. He is an important factor in this because he witnesses in the wear and tear of books in the schools shortcomings in binding and printing, and learns of defects in methods of treatment from the criticisms of teachers and patrons. These faults he is more anxious to correct than anyone else. This causes him to be alert at all times in the interest of his customers—the schools.

Bookmen are not interested particularly in any one system or plan of adopting textbooks. They are in favor, as a rule, of the existing plan in their respective fields. They cannot see, however, why teachers and superintendents with their interest in the well-being of the children in the schools can fail to oppose the form of state adoption; for under this plan the influence of the teacher, principal, or superintendent is practically destroyed. Where the town or city is the unit of adoption the trend is more and more to place the decision of textbook questions in the hands of teachers and their responsible superior officers. In my opinion, "Massachusetts is in advance of any other state in its solution of the problems involved in a representative government." The textbook law in Massachusetts, on the statute books over forty years, is as follows: "Changes may be made in the textbooks used in a town at any time, notice having been given at a previous meeting and two-thirds of the members of the Board voting in the affirmative"—simple, compact, progressively conservative, affording opportunity for changes, requiring careful consideration. Last year the legislature passed an act requiring the superintendent of schools to make his recommendation of textbooks to the Board of Education, as a prerequisite to action on the part of the Board of Education. The bookman always welcomes the trend of the question of selection of textbooks to the skilled

teacher modified by the judgment of principals and superintendent. By that method he escapes the influence of the politician, of the relative of some board-member's wife, of the enthusiasm for a rival's wares because someone belongs to the same college fraternity, or went to the same preparatory school.

Strange as it may seem to some, publishers of textbooks and their employees, the bookmen, are leaders in the development of better methods and higher ideals in the conduct of business. Yet this paper would be incomplete without some discussion of the faults and misdemeanors of some few members of the profession. The bonus system—postdating of bills, extra discounts, cutting of prices when times are dull, etc.—is a common practice in many lines of trade. Banks are still soliciting depositors' accounts by promising interest on monthly balances. Dealers in pianos, automobiles, certain kinds of new machinery, continue the practice of paying commissions directly and indirectly for new business. Publishers of magazines offer premiums in various forms to new subscribers. It is an axiom in the business world that a business cannot be developed on any other basis than that of absolute and unswerving honesty. But there is always a small percentage of business men who are not built right actually always to do what they believe is right. A salesman knows that if he misrepresents an article, hides defects in it, exacts too high a price for it, overstocks his customer by an inordinately large order, that the doing of any one of these acts will react upon himself and work an injury to him and his future prospects. Yet some salesmen, who have not been consciously disciplined by experience, will still take a chance. Man's moral fiber has not yet been sufficiently strengthened in his struggle upward, always to withstand temptation. The ability to put aside an apparent immediate benefit, even when one's intellect tells him that in the long run such decision is right, is an attribute not universally possessed. Happily for most of us, life is not a tragedy but a comedy. The conflicts in the sphere of duty which constitute tragedy, in a comedy, are always modified by happenings which mediate these conflicts. It is like a bad dream which, enmeshing us in its horrible chain of circumstances, is suddenly ended by an awakening. We are told by the moralists that this course is right and that is wrong—why hesitate a moment over your decision? In actual life, however, such a clear proposition is seldom presented—usually there is always some wrong mixed in with the right and some right with the wrong—and one's decision in such cases is not so easy as the professional moralist would have us believe.

Now, the oftener a man is required to act, exercise his judgment and the number of different planes in which these actions lie, bear a relation to the number of errors he will make. As bookmen need to act on inferences oftener and on more fields than teachers or principals, they ought certainly to make more mistakes. When such error or mistake in judgment is com-

mitted by a bookman who has a quasi-public position in his world, it is likely to have much more publicity than similar shortcomings on the part of other business people. The author, the editor, sees his mistakes in black and white, but the errors of teachers, superintendents, managers of businesses, bookmen are not so definitely chronicled. Yet some bookmen have been guilty, in prosecuting their business, of errors, faulty judgments, and indiscretions. Teachers, principals, college professors, ministers too, have erred in our time to such an extent as to bring some few individuals within the meshes of the law. But you cannot successfully indict a whole people, nor a whole class, nor a whole profession because some individual member has erred. On the whole, bookmen, in their methods, their line of action, their life in and out of their business, challenge comparison with any other class of business men.

For this present purpose I assume that teachers may group our errors under four heads:

1. Discrimination in terms—giving to one place better rates than to another in order to secure business, some phase of the bonus system, etc.
2. Undue activity in the politics of the National Education Association and state teachers' associations.
3. Meddling in the affairs of the school—assisting teachers and superintendents to secure places; the use of political influence in or outside the schools.
4. Personal criticism of competitors for imagined business gain.

First. In over twenty-five years' experience in the business I have known and been informed directly and indirectly of not more than twelve instances of irregular practice on the part of bookmen. The motive in each case was intense personal feeling against some rival bookman and the desire to win at all hazards. Of course such actions are reprehensible and should be frowned on by everyone inside and outside the business. If this is true, it will be asked why does the publisher not promptly discharge the offending bookman and publicly disown the wrong act? For the same reason that in the family we do not publicly disown one of its members; for the same reason that a superintendent of schools does not recommend the discharge of a teacher who does some stupid thing or gets tangled in the maze of questionable action. Again, the spirit of the age no longer permits the penalizing of employees for errors or faults which can be eliminated thru wise counsel of superiors.

Second. Undue activity at meetings of state teachers' associations or at the National Education Association. If bookmen are members of said association, or associations, they have as much right as other members to express their convictions on matters relative to the policy of the association. As a matter of fact, bookmen rarely take any interest in either the program or the politics of such associations. They never do unless solicited by superintendents or teachers. In such cases the votes and support of bookmen are as various and diverse as the votes and action of any other class of voters. Publishers themselves have no interest in such matters.

Third. Meddling in local politics or use of political influence. In communities where such influences control school affairs, such as the election of a superintendent, the appointment of teachers, the selection of janitors, the choosing of school sites, the erection of buildings, etc., it can hardly be denied that they may also affect the adoption of textbooks. Here are conditions into which the bookman is thrown, and for which he is in no way responsible. A man of ability and character, who has worked long in a limited field, has acquired an extensive acquaintance; he comes in personal contact with leading people in the various parts of his territory. He must be politic and tactful, as well as energetic in the prosecution of his business. Under such conditions he may be tempted to use the local political forces; the high-grade bookman never does, because of the ultimate danger to his business from such an alliance: because such aid becomes a burden on him and his business. No one regrets more than do the publishers and the bookmen interference in educational matters thru politics or politicians. But I know of no ground which justifies any general accusation against the bookmen of resorting to politics in the prosecution of their business. Probably such charges in nearly all instances originate in the attempt of an unsuccessful rival to account for his failure. Superintendents in search of competent teachers for an immediate vacancy seek the advice of bookmen at times because of their large acquaintance. If a bookman commends some worthy teacher, in response, isn't it ungenerous to intimate that he has other motives than serving the schools and a worthy teacher? Personally nothing gives me greater pleasure than to serve an excellent teacher or superintendent, because I feel that by so doing I am helping the schools—no one ever suggested to me that I had an ulterior business motive in such action. In my own case I am as careful in recommending teachers as I was when superintendent.

Fourth. Personal criticism of competitors for imagined business gain. The evil of "knocking" one another, in the slang of the day, is more or less prevalent in every line where there is intense competition. It occurs in the professions and thruout the commercial world. Echoes of such misrepresentation are heard from small people in college faculties. The business of publishing school books and selling them ought to be above and beyond this sort of thing. It is with great regret that I admit that this is not always the case. We are too prone to gossip and to criticize others, to the loss of our own dignity and the consequent impairment of our business. This practice, however, brings its own punishment. The lawyer who indulges in personal insinuations or reflections upon his opponent fails to rise very high in his profession. The doctor of medicine who is prone to point out the weaknesses or incapacity of his rivals loses caste. The practice comes from a low view of business ethics by the publisher, and from a futile tendency to magnify himself, which is sometimes a by-product of acute business rivalry. There can be no question that such

habit is very objectionable, contrary to sound business principles, and should be frowned upon by all right-thinking people. Bookmen are, in effect, the attorneys of their respective houses; though cordial in their treatment of each other, when not engaged in contests, the intense personal antagonism between rival bookmen in heated and long-continued rivalries sometimes presents a demoralizing picture when viewed by a spectator who is not conversant with conditions. Rival real estate agents buying a particularly coveted property, newspaper reporters on track of an important news item, all men engaged in a fiercely competitive business go thru similar experiences. That the large majority of bookmen waging war against each other, living their lives in a small territory, nearly always in the limelight, can carry on their business efficiently and successfully and continue to receive the respect, the confidence, the friendship of practically every high-class man or woman with whom they come in contact in the schools, is a high tribute to the integrity, honor, and character of the profession.

When suitable opportunity to meet teachers and superintendents is given bookmen, only good can come from their visits. It is a maxim among bookmen that the busiest, ablest, and most prominent school officials and teachers are always the easiest to see. It is so rare when a bookman is denied an interview or prevented from prosecuting his missionary work that such occasions are a negligible quantity. An insistent, ill-mannered individual may, it is true, place himself outside the pale of even the great courtesy of the school world. Of course there are some narrow-minded, self-centered, all-knowing school officials who look upon the bookman as an unnecessary evil. Such men are rare; such attitude being reflected in their school activities elsewhere usually brings about a proper point of view. Trade, commerce, and science are interwoven together. Nothing is more anomalous, illogical, and unjust than antagonism between publishers, bookmen, and teachers. There should be complete sympathy and understanding between them. The bookman should express this policy in his actions at all times. Courteous, respectful but not apologetic, anxious to perform his principal duty as salesman, reasonably jealous of the ethics and responsibilities of his profession, but conscious that he is a factor in the cause of education.

To my mind, therefore, the bookman belongs properly in the system of education. He has a necessary function to perform. He will perform that function until other parts of the system develop so that the work performed by him can be better performed by them. Then, in accordance with the law of progress, he will pass away. Until that time it is to be hoped that he will live his life with the agencies for good in the schools and do his part toward reducing the number of his shortcomings, that thereby the efficiency and well-being of the schools may be increased.

THE EFFECT ON EDUCATION AND MORALS OF THE MOVING-PICTURE SHOWS

JOSEPH R. FULK, SUPERINTENDENT OF SCHOOLS, SEWARD, NEBR.

The moving picture has developed a form of public entertainment that has within the last few years spread itself over the entire civilized world. It seems that at last a universal means of communication has sprung into popular use everywhere.

The still picture has in all times exerted great influence with cultured and literate humanity. The magic lantern and its modifications enlarged very much the influence of the still picture, but language, written or spoken, was required to give to it anything like complete meaning. The moving or living picture is universal. It carries much meaning without language. Interpretation of action is an instinctive tendency.

This paper is part of a general study of the moving-picture show. Altho the topic limits the discussion to the effect of these shows on education and morals, some of the facts concerning the development, financial aspects, and control of the business are given to point out the magnitude of the new problem.

In their report for the year ending December 31, 1911, the Bureau of Moving Pictures of the City of Chicago gives the following figures:

Total number of films approved.....3,255
Total length of films approved.....2,604,000 ft.
Total number of 5c and 10c theaters that exhibit moving pictures...400

Here are five hundred miles of original films released in one city in one year. During the same period the censors of the bureau rejected thirteen miles of films.

At present there are at least thirteen thousand moving-picture theaters in the United States. The increase is about one thousand annually. Conservative authorities place the daily attendance at five million. The attendance at the fourteen hundred regular theaters is about seven hundred and fifty thousand a day.

The film-manufacturing business has grown to enormous proportions. The great film companies employ studio "stock" players, and send groups of actors to all parts of the world to secure films with natural and historical settings. Films are made depicting life, industries, and scenery in many parts of the earth. The business has its trade journals, film bulletins, magazines, and state and national exhibitors' associations. Within the last year several schools have been opened for the purpose of teaching how to write scenarios or motion-picture plots.

These facts indicate that this new form of public entertainment is neither a fleeting fad nor a mental epidemic, but is a sociological force that must be reckoned with.

There is great truth in this assertion of Maeterlinck: "It is the way in which our hours of freedom are spent that determines, as much as war or as labor, the moral worth of a nation." The American people spend about one-fourth as much time in moving-picture shows as is spent in the public schools by children from fifteen to eighteen years of age. Authorities estimate that at least 25 per cent of those who attend are children. A careful investigation of the attendance in thirty-six towns and cities of Nebraska shows that 35 per cent of those attending are children under fifteen years of age. Children and adults of all classes sit side by side in the dim light of the motion-picture theater. The public school and the moving-picture show seem to be the only truly democratic institutions in the United States.

The control of the output of films is by far the greatest factor in the motion-picture problem. The Board of Censorship of New York City was formed in 1909, and was recognized by the film manufacturers as national in 1910. The report of the National Board issued in May, 1911, asserts that more than 99 per cent of all pictures publicly exhibited in the United States are censored by the board, and that the board's verdict is carried out with approximate completeness in all parts of the country. Reports from various cities testify that the board has done much to place cleaner and better films on the market. The board has also aided in developing the educational possibilities of the motion picture. However, comparatively few educational films are produced. The 630 films released by the "Licensed" and "Independent" manufacturers during November and December, 1911, are listed in "Motography," a magazine whose purpose is exploiting the motion picture, as follows: dramas, 86 per cent; scenic, $6\frac{2}{3}$ per cent; current events, $2\frac{1}{2}$ per cent; educational, 5 per cent.

"Motography" for January, 1912, in reviewing the year 1911, says:

> The year has been marked by a general increase in the output of films, most of the licensed, and many of the independent, makers adding one or two reels to the weekly product. It is to be regretted, however, that a large portion of the new product has not been devoted to scientific, educational, and travel subjects.

Some of the film manufacturers have educational departments. In reply to an inquiry one of the large companies answered as follows:

> We have in course of preparation a Moving Picture Library of America, which will embrace trips treated in a comprehensive manner, covering all the states, and showing the principal attractions; points of interest in cities, and along railroads; rural and city developments; views of the largest industrial institutions with data pertaining thereto; historical scenes and topography of each state. It will be possible for a school to obtain a single film of one state or films of all the states.

In his catalog which he calls "An Educational System by Visualization," George Kleine of Chicago lists over one thousand films. This he claims includes all available films on educational topics. Many in this list, however, are very loosely called educational.

The Edison company will soon put on the market a moving-picture machine designed especially for school and home use. This machine, which is to sell for about fifty dollars, will use a special film costing about twelve dollars. This is about one-tenth of the cost of the ordinary trade film. These special films will be rented to schools at a reasonable rate.

A few schools, churches, and other organizations are now using the motion picture as an educational and moral help. These uses, however, are comparatively rare. At present, it is the motion picture in the public show that is yielding the influence.

The popular motion picture is essentially dramatic. In some respects it is a modern development of the pantomime. As a rule film manufacturers use educational material only when it contains a dramatic story in some form. The drama in its various forms has always played an important part in civilization. The moving-picture show has done for the drama what printing did for literature. It has brought a form of dramatic art into the daily life of the people. The photoplay holds and affects an audience in very much the same manner and degree as the regular drama. It may have fifty or one hundred scenes if needed; may follow a character from place to place, and may present scenes and circumstances that are not possible on the stage. But it has its limitations. When action is subordinated to an element of character the film is inadequate. What people are may be suggested only by what they do. The appeal is thru the eye, and is chiefly emotional. This omission of language and of the direct intellectual appeal weakens the motion-picture drama, and renders it less moral, because it stirs primitive passions and does not arouse highest mental activity.

Anyone who has observed moving-picture audiences when educational films have been thrown on the screen must be convinced that people do not go to these shows to be instructed. It is the dramatic short-story film that appeals to them. The films that give the thrills of the "yellow back" novel without effort or exertion are most popular. Indians, cowboys, domestic troubles, daring deeds, elopements, the love story, these are the common popular themes. There is much display of the sentimental. Many of the situations and experiences of life that are more or less sacred or private are shown again and again to audiences of both sexes and of all ages. The moving-picture show does not recognize the child and the adolescent. Special shows for children would remove many of the objectionable features. At present the question is not, "What shall my son or daughter read?" but, "What moving pictures shall my son or daughter *see?*" The sensational and emotional novel is *seen* these days, not read.

This constant playing upon the emotions of the child and adolescent tends to overexcite, and to dull the finer feelings, and to prevent the normal development of the emotional life. The overexcitement creates an ever-increasing desire for something that stirs and thrills. Whatever holds

attention determines action. This growing desire for emotional excitement is apt to lead children, and adolescents especially, away from right ideals and morality. Here lies the greatest moral danger of the motion-picture drama. The possibilities for evil due to the dim light of most of the moving-picture theaters add much to this danger.

The direct educational influence of the moving pictures in the public theaters is very difficult to measure. No one doubts that under proper supervision the motion picture can be made a valuable help in formal instruction. Certain phases of many school branches, such as historical events, industries, transportation, and customs of peoples, may be taught more effectively with their aid. But it seems to me that the educational value and possibilities of the motion picture have been unduly emphasized.

Attention to moving things is instinctive, and is not apt to be accompanied by real mental activity. If the moving objects are constantly changing in form and position there is continuous change of ideas. The mind cannot rest on any object of thought. The "stream of consciousness" becomes a torrent, in which things may be recognized, but not accounted for nor reasoned about. The film of the moving-picture show moves very rapidly. There is very little given in the way of explanation. The mind is hurried from one thing to another until the picture becomes little more than a fantasy or day-dream, unless it has a strong emotional appeal. If there is *impression*, there is no chance for *expression*. Posed educational films often misrepresent, and some films advertised as taken on the spot are evidently posed. All frequenters of moving-picture shows are acquainted with the New England buildings and background of the cowboy and western Indian films, and many have seen a lion hunt in Africa or a jungle scene posed in a film plant in Paris, New York, or Chicago. Travel and geographical films give about the same conception of a region as is obtained by viewing it from a railway train.

The headliners of the newspapers interpret the facts for the busy or mentally indolent readers. The cartoonists do much to mold public opinion. In London there are three daily papers which contain practically nothing but news pictures with short explanations. *The Animated Gazette* is a London film organization that furnishes a daily service of moving pictures of the news to a circuit of theaters having audiences of two million daily. Weekly current-event films are now used by many of the moving-picture shows of this country.

All of these organizations and forces tend to weaken thought power by furnishing to the people ready-made interpretations and conclusions. The same influence is being exerted in the field of literature by the photoplays based upon standard literary productions. The standardization of the interpretation of a poem like "Enoch Arden" robs the poem of its chief value, and takes from those who have not read it the joy of the reading. Such a poem cannot be seen except in the imagination of the reader. The

usual crudeness of the acting and the inadequacy of expression make the photoplay of such a poem a serious obstacle to real interpretation and appreciation.

It seems to me that under the most favorable circumstances the public motion-picture theater has very little educational value, and that these shows as now managed are often detrimental to education.

My investigation has led me to believe that on the whole the motion-picture shows are less harmful to education and morals in the large cities than in the small cities and towns.

This conclusion is based to a great extent upon an investigation carried on in Nebraska, and also on my own observation of the shows themselves. I sent a questionnaire on the motion-picture show to the superintendent or principal of the public schools of every city or town in Nebraska having a population of seven hundred or more. Reports are tabulated from 68 towns. Of the towns reporting, 20 have a population of less than one thousand each; 27 between one and two thousand each; and 11 between two and three thousand. The list includes one city with a population of ten thousand, and five between five and ten thousand each.

There are 95 moving-picture shows in operation in these 68 Nebraska towns. The average attendance in the 36 towns reporting that item is 40,000 per week. Thirty-five per cent of those attending are children under fifteen years of age. The previous business of the managers of 54 shows was reported. Among these, seventeen had been in the merchandise business; six loafers or no business; six farmers; five showmen; three billiards and pool; two barbers; two editors; two students. Eleven other callings were represented. Few especially fitted men were in charge of shows. The business is strictly commercialized.

Of the 64 towns answering the question: "Are shows open on Sundays?" 57 reported "No"; 7 "Yes." Sixty-one out of 65 reported no local control of pictures shown.

"Are there any local restrictions or ordinances regarding the attendance of children?" was answered in the negative by each of the 64 towns reporting. One town reported a movement to pass an ordinance refusing admission to children, after the first evening show, unless accompanied by parent or guardian.

Forty-one towns reported no local opposition to the shows; 11 some or very slight opposition; 12 organized opposition. The organized opposition was by churches, good-government clubs, and public schools.

In 40 towns all classes of people patronize the shows; 10 report attendance chiefly young people and laborers; 5 name the rowdy element as prominent.

Thirty-seven schools reported that the shows were harmful to school work; 6 helpful or not detrimental. The commonest causes of harm given were: "neglect of home study"; "diffused attention and dullness"; "wrong

ideas of literature, geography, and history"; "frivolity and desire for cheap entertainment"; "general tendency toward the coarse and low, the rude and disrespectful." The only helpful influence named was, "Creates interest in geography and history."

In answer to the question, "What is your opinion of the influence of these shows upon school children as regards character formation?" 38 replied "bad, detrimental, harmful, or no good," 10, "good, no bad effects," or "very little influence." Some of the causes of evil influences were: "Numerous love scenes foster too much familiarity among boys and girls"; "desire for excitement"; "at shows children mingle with all classes, hear indecent jokes, etc."; "take children away from home"; "the music never elevates"; "wrong impressions of life created"; "lessens capacity for earnest, persistent work"; "cultivates habits of careless spending"; "many pictures suggest evil to boys and girls." The good influences were not named.

Forty-seven reported the shows harmful to the physical welfare of school children; 8 no injurious physical effects noticed. "Injury to eyes," "bad ventilation," and "loss of sleep" were most often given as physical harm.

Thirty-eight reported that they considered the shows more harmful than beneficial to the community; 13 more beneficial. The chief harmful causes given were: "Deprave public taste"; "trivial waste of time"; "appeals to sensational side of life, and ruins better class of public entertainment"; "causes children to want to be entertained"; "engenders idleness." Some of the benefits named were: "wholesome amusement at low cost"; "much better than ordinary cheap shows"; "keeps young men from pool halls"; "comparatively harmless for a class that would spend money for dance or drink"; "supply considerable information."

In a few cases superintendents showed very little interest in the subject, and their replies indicated very slight knowledge of social conditions in their communities.

My general study of the motion-picture problem and the special study of conditions in Nebraska seem to justify these conclusions:

1. The moving-picture show has come to stay, and will increase in numbers and influence.

2. The character of the films shown and the general influence of the shows have improved much in the last three years.

3. There are important possibilities in the educational film, but the public motion-picture theater has very little, if any, educational value. The people want to be thrilled and amused, not instructed.

4. The moving-picture show yields a tremendous moral influence, that is not generally understood or considered. At present this influence is decidedly detrimental.

5. At present the public motion-picture theater is doing more harm than good, especially in the smaller towns.

THE STANDARDIZATION OF JANITOR SERVICE

G. M. WILSON, SUPERINTENDENT OF SCHOOLS, CONNERSVILLE, IND.

The physical basis of our school work is in charge of the janitor. We look to him for proper temperature, proper ventilation, proper humidity, and proper cleanliness. These matters are related very directly, not only to the health and happiness of the child, but to his progress in school work as well.

Dr. Putnam says:

> Methods of precision are as practicable and as necessary for caretakers of a school as for nurses in a hospital; their routine practice is entirely possible with reasonable instructions.

Janitor service being physical and manual would seem to lend itself readily to standardization. But my investigations show a general absence of standards and a resulting inefficiency and neglect. This is wrong, for compulsory education means compulsory contagion and disease unless physical conditions are kept right. No good homemaker has the dirty floors and foul air with which we shut up children and teachers.

The desire to improve the janitor service in my own system led me two years ago, under the inspiration of ex-Commissioner Brown, to attempt a study of janitor service. It became evident early in the study that there was little agreement as to definite standards. The facts gathered with reference to *cleaning* will illustrate the situation. Out of 40 manuals of rules and regulations examined, 24 made any reference to the duties of janitors. With a possible mention of and agreement on 288 points in connection with scrubbing, sweeping, dusting, and other simple points in cleaning, there was an actual mention of 58 points and a practical agreement on 13. Two of the 40 manuals indicated how the scrubbing was to be done. Two indicated how the woodwork was to be cleaned. Three indicated how the walls were to be cleaned, but the practice even among the three varied from cleaning the walls once in two months to once a year. Six of the 40 manuals indicated how often the windows were to be washed, but even among the six mentioning the point the frequency varied from one month to three months. Cities whose manuals of rules and regulations were examined were scattered thruout the following states: New York, New Jersey, Pennsylvania, Maryland, Ohio, Indiana, Illinois, Minnesota, Nebraska, Iowa, Montana, California, Texas, Louisiana, Georgia, and Kentucky. The cities are fairly representative of the country, but even among cities in close proximity there is no more likelihood of agreement than among these widely scattered cities. The following illustrative table (p. 463) shows the distribution on a few of the facts considered.

The study of rules and regulations was followed by sending out a questionnaire in July, 1910, in which the chief points covered were the following: How are the floors dressed? How often in halls, in rooms? Are floors

scrubbed or mopped, and how often in halls, in rooms, and in toilets? How is the sweeping done—with broom, with brush, with dust-down? How often is the sweeping done? And in like manner details as to cleaning the woodwork, dusting, washing windows, and caring for the blackboards were called for. Not all of the returns from this questionnaire were summarized, but a number were selected at random, which from all appearances were fairly representative. The cities selected were distributed thruout the following states: New York, Ohio, Indiana, Iowa, Kansas, Florida, and Illinois. In 17 cities selected at random, with the possible mention of and agreement on 476 points, there was an actual mention of 274 points and a practical agreement on 155 points, which is 56 per cent of the points mentioned or 32 per cent of the total points. The 32 per cent of agreement on total points is the significant figure, as omission in the questionnaire means the absence of any definite standard. The word "practical" in this study was inserted in order to get agreement where there was very little evidence

	Floors—How Dressed	How Often	How Scrubbed	How Often Rooms	How Often Toilets	How Often Swept	How Cleaned Woodwork	How Often	Cleaned Walls	Dusting	Often Cleaned Windows
Number mentioned out of 40	0	0	2	10	6	9	2	9	3	11	6
Largest practical agreement	..	..	2	6	4	8	2	3	2	9	2
Range of practice	..	..	"Mop"	Monthly to twice a year	Daily to yearly	Daily to twice a week	"Wash"	Monthly to twice a year	Two months to yearly	Daily to twice a week	1 month to 3 months

of agreement. For instance, woodwork cleaned from two to five times a year was considered as agreement. The real agreement is in having no definite standard. This is further illustrated by some of the details. Woodwork was cleaned variously from daily to once a year. The baseboards were dusted in some places daily, in other places yearly. The windows were washed in a few places weekly and other places less frequently to twice a year. The illustrative table (p. 464) shows the distribution on a few points studied in the questionnaire.

It seems reasonable to conclude from the study of rules and regulations and from the returns based upon the questionnaire that there are no well-established standards in the matter of schoolroom cleaning. The large number not reporting or reporting very indefinitely is stronger evidence of the absence of standards than the lack of agreement among those reporting. The two lines of investigation point to the same conclusion. Variations may be due to conditions, but under any conditions there should be a standard. Some of the sources of error in the foregoing investigations are: (1) The difficulty of getting at actual practice thru a manual of rules and

regulations. (2) The desire of superintendents to make a good showing in a questionnaire, especially when in doubt as to facts. (3) The difficulty of comparing situations that may vary as to important factors.

About two years ago Dr. Ayres studied a few of the facts with reference to schoolroom cleaning in 1,038 cities scattered thruout the United States. In his fine optimistic way Dr. Ayres notes the tendency toward better sanitary conditions and methods as applied to cleaning. Yet the other side of the situation shows that there were 395, or nearly 40 per cent, of the 1,038 cities where moist cloths were not used for dusting purposes. There were 144 cities, or over 10 per cent, not using dust-absorbing compounds for sweeping. The median frequency of the washing of schoolroom floors was $3\frac{1}{2}$ months, the variation being from one day to never (which doubtless means eternity). The median frequency of the washing of windows among the 1,038 cities was four months, the variation being from once a week to once a year, seven again reporting never. In order to test out to an extent

	Floors—How Dressed	Often Rooms	How Cleaned	Often Halls	Often Toilets	Often Swept	How Cleaned	How Often	Often Walls	How Dusting	Windows Often Washed
Number reporting out of 17....	11	8	10	11	10	15	14	14	12	14	13
Largest practical agreement.....	7	2	6	4	4	14	11	5	3	8	10
Range of difference (underscore prevalent).....	Oil	1 month to 5 years	Mop	Daily to yearly (monthly)	Daily to yearly (monthly)	Daily	Wash	Monthly to yearly (3 times a year)	2 to 5 years	Damp cloth	Weekly to 4 times a year

the statement made by Dr. Ayres that "these most encouraging signs of progress with respect to the cleansing of schoolrooms indicate that the day is not far distant when our schools shall be as clean as hospitals"; in order to learn to what extent we were approximating these conditions, I secured from Dr. Ayres, under promise of strict secrecy, the names of 50 cities where dust-absorbing compounds were not used in sweeping, and the names of 50 cities where moist cloths were not used in dusting. To these 100 cities letters were sent including a self-addressed postal, ready for reply after inserting the word "yes" or "no." This reduced the effort on the part of those responding to a minimum and insured a large measure of accuracy in the returns. The returns indicate that the optimism of Dr. Ayres is not without some foundation. Twenty per cent of those responding have in the last two years adopted the plan of using dust-absorbing compounds in sweeping, 80 per cent are persisting in their former insanitary methods. Thirty-six per cent of those responding indicate that they are now using moist cloths in dusting, while only 64 per cent persist in the use of former methods. Not

all responded. It is possible that those who could respond favorably responded a little more promptly and therefore a little more surely. The replies indicate that progress is being made slowly and that much remains to be done, for the smaller, less fortunate schools were not included in the inquiry.

The further study made recently thru the courtesy of the educational journals, in printing a questionnaire, does not add in any material way to the information as gathered in former studies. Window-washing, for instance, continues to vary from once a week to summer showers. Thruout it is noticed that it is with rare exception that any definite standards exist with regard to cleaning. While I do not know with any definiteness that the same conditions exist in other lines of janitor work, yet I will venture that many of you are ready to agree that the same conditions do exist and that there is a general absence of definite standards with regard to lighting, heating, ventilation, and practically all of the lines of janitorial service.

Now for a few minutes I desire to defend the thesis that it is possible to fix definite standards and thereby to increase greatly the efficiency of janitorial service. As regards ventilation, we know that each pupil is entitled to 200 cubic feet of air space with an inflow and exit of 30 cubic feet of air per minute. It is possible to measure and insist upon this standard of fresh air. We know that foul air is conducive to catarrhal and pulmonary diseases, and that contagion spreads under such conditions. We know, on the other hand, that fresh air is very closely related to a fresh mind, to progress and success.

In the matter of lighting we know that clear, clean glass should equal one-fourth the floor space, that the light should come from one side of the room only, that no light should come from the side of the room opposite the teacher's desk, that the width of the room should not exceed 30 feet from the left side, that chipped glass reduces the amount of light from 25 to 50 per cent, that the upper one-fourth of the window furnishes one-third of the light, etc. We know also, that this is directly related to cleaning, that dirty windows mean a reduction in light varying from 10 to 50 per cent. Knowing all of the foregoing, it seems possible to determine a definite standard for lighting and in any particular locality a definite standard for cleaning the windows. It is just as surely known that this will not be secured by a direction to wash the windows "when dirty" or "as often as needed."

As regards humidity, we know that enlarged tonsils, catarrhal diseases, generally nervous and anæmic conditions follow the failure to humidify the air properly. We have a definite standard fixing a lower limit as 60 per cent and the upper limit as a relative humidity of 70 per cent. We know the methods by which to secure the proper standard of humidity. So here again it would seem possible to fix and to carry out a definite standard.

With reference to the temperature of the schoolroom, we know that a

uniform temperature of 68 degrees means from 25 to 50 per cent less coughing and colds in the schoolroom than a temperature of 72 degrees. We know that excessive temperatures mean a weakened condition, rendering the child susceptible to disease and impeding progress in school work. We were told by the Science Department of this Association last year that the temperature should never under any circumstances be permitted to pass 70 degrees Fahrenheit, the lower limit being 66 degrees. In regard to temperature there is certainly one standard which can be fixed with confidence. And yet we find a wide variation from this standard and a prevalence of high temperatures.

The foregoing brief discussion calls attention to the fact that in addition to cleaning there is a possibility of definite standards of janitorial service in connection with ventilation, light, humidity, and temperature.

Now permit me to return to my own situation and to report what we have accomplished during the past two years in regard to schoolroom temperature and cleaning, and the means employed to secure the results.

The schoolroom temperature has been reduced from a variable ranging from 70 to 75 or 80 degrees to a close approximation to a constant at 68 degrees Fahrenheit. This has been accomplished thru special attention to the matter and requiring a report on alternate weeks showing the temperature at five chosen times thruout the day. The record is made by pupils in upper grades.

A janitor's schedule fixing standards and organizing the work at each building has been most effective in securing results in cleaning. The schedule varies slightly with different buildings. The janitor's schedule for our central building is given herewith.

JANITOR'S SCHEDULE

1. *Yard.*—Papers picked up daily, walks swept daily, morning. Ropes for may poles and swings put up before 8:00 A.M.

2. *Scrubbing.*—Scrub all toilet floors and urinals twice per week. Wash seats with warm water, gold dust, and coal oil—Wednesday and Saturday. Scrub gymnasium once per week—Monday A.M. Once every *six weeks* scrub halls and schoolroom floors—Monday.

3. *Woodwork.*—Once a week wash door knobs, hand rails, banisters with warm water, gold dust, and coal oil—Saturday. Once every *six weeks* wash other woodwork—Thursday.

4. *Walls.*—Brushed down every six weeks. Downstairs third week, upstairs sixth week.

5. *Sweeping.*—All schoolroom, hall, toilet, and basement floors swept *daily* with dust down and brush—evening.

6. *Dusting.*—Done with cloth dampened with water or coal oil. Desks, doors, window sills, and baseboards dusted *daily.* Pictures, doors, and window casings once a *week*—Friday evening.

7. *Blackboards* cleaned each Saturday and troughs swept out daily.

8. *Windows* washed inside and out *twice per month* with bon ami or alcohol.

This schedule secured decided improvement immediately. Any janitor who took an interest and pride in his building welcomed it. It set a standard and systematized his work.

It is not effective to require that the building be kept "in sanitary condition." Whether it is original sin or an acquired tendency, janitors, when left to do things "as needed" or "as often as necessary to insure sanitary conditions," show a decided preference toward toasting their shins in front of a furnace rather than cleaning windows, walls, woodwork, and floors—in halls, closets, and unoccupied rooms. They prefer to leave this work for the annual cleaning period on extra pay during vacation. As janitors are usually paid there is no objection to the extra remuneration, but objection is made to the filthy, disease-breeding conditions resulting, in which children must live.

Recently the plan of requiring a regular report on the cleaning was begun. The report is made at the close of each six-weeks period. It covers washing windows, scrubbing floors, cleaning woodwork, etc., and requires the signature of the teacher in the room. This report keeps the work constantly before the janitor, teacher, and principal, and brings a summary regularly to the attention of the superintendent. It is safe to say, that in the cleaning phase of our janitor work we get fully twice as much work from the same force of janitors with no increase in cost of service.

These measures—definite schedule and regular report—have brought results "of which we do know." Dr. Dresslar of the Bureau of Education has called my attention to a recent development in the way of further improvement and standardization of janitor service. It is the selection of a head janitor centrally located who shall instruct other janitors in details of the work with the notion of bringing the poorest up to the standards of the best.

My investigations and experience justify the following conclusions: First, there is a surprising absence of standards in janitorial service. Second, being physical and manual, almost every phase of janitorial service lends itself readily to standardization. Third, increased efficiency of janitor service and more sanitary conditions for the child follow quickly upon standardization. Fourth, a regular system of reporting aids in maintaining the efficient service required by the established standards.

THE RELATIVE COST OF EDUCATION OF HIGH- AND ELEMENTARY-SCHOOL PUPILS

E. O. HOLLAND, SUPERINTENDENT OF SCHOOLS, LOUISVILLE, KY.

What proportion of the school revenue should be devoted to the care and instruction of the elementary pupils and what proportion to the education of secondary pupils? In glancing thru the annual publications issued during the past ten years, by the National Education Association for its various departments concerned with public-school work, I was unable to find any detailed discussion of this important subject.

At one time, not many years ago, the traditional elementary- and

secondary-school work seemed to meet the demands, if not the needs, of the general public. At that time, too, a more careful analysis of the relative expenditures of public money devoted to the elementary and the secondary divisions of a public-school system was not of great importance, since these expenditures could be roughly estimated and a fair proportion maintained. Even with the introduction of kindergarten work in many of the school systems, the danger of weakening the efficiency of one large department of the school work was inconsiderable, especially where the superintendent was given reasonable freedom of initiative. But today, with the establishment, for example, of continuation schools for the pupils who abandon the traditional classroom work at an early age, and with the creation of special schools for the anæmic, the foreign-born, the defectives, and the incorrigibles, the task of maintaining the proper equalization in expenditure is much more difficult and requires a more careful analysis.

This is obvious since most of the special types of schools, recently established, care for children that belong to the general elementary field. Consequently there is a decided tendency to maintain all these special schools from the funds that have usually been set aside for the maintenance of the elementary schools alone. Another additional drain on the elementary-school funds, which should be considered here, is due to the larger enrollment in the grades for which our more effective compulsory-education laws are directly responsible.

So far as I have been able to learn, there is no school system in this country that today is spending too much money on its graded schools, but it is not difficult to give the names of several large cities that are spending entirely too large amounts on their secondary schools.

Unfortunately the more intelligent forces of a community do not wait for an analysis of school expenditures to make known their wishes; they are especially insistent in their demand that the high schools be properly cared for. Generally speaking, only a small group of these same individuals will visit a ward or graded school and demand that more money and effort be expended upon the younger children. As a consequence, the greatest disproportion in expenditure can be found among those cities where expert educational leadership has been ignored and where disproportionate expenditures follow the wishes of a small but powerful group of citizens who do not understand that the granting of their demands by the school authorities will entail hardship upon hundreds of teachers in the grades, lower the efficiency of the whole public-school system, and will be the direct cause of increasing the school mortality at an alarming rate.

The expenditures in the city of Louisville for secondary education have been and are still out of all proportion to what has been spent on the elementary schools in that city. I shall give the details concerning this situation, since I am familiar with them and they serve to emphasize the need of establishing some general standard to determine expenditures.

Louisville is a city of slightly less than a quarter of a million inhabitants, and yet a year ago it was attempting to maintain seven separate high schools. Three of these schools were for girls, two for boys, one—the commercial high school—for both boys and girls, and a colored high school for both boys and girls. When we consider that the city of St. Louis, with a population of 687,000 inhabitants—three times as large as Louisville—is today maintaining but five secondary schools, we can understand that, relatively speaking, Louisville has been neglecting her elementary schools, in which 90 per cent of the entire school enrollment is to be found.

Very recently the members of the Louisville Board of Education began to make an investigation to discover how much of a disparity there was in these expenditures. In comparing Louisville and Indianapolis, cities of the same size, they discovered that the enrollment in the two Indianapolis high schools was in excess of 3,600, while the seven Louisville high schools had an enrollment of 2,700 pupils, or 900 less. Furthermore, they found that, based upon enrollment, it cost $58.77 to educate a high-school pupil in Indianapolis, while in Louisville the cost was $76.76 per pupil. It should be stated here that the Louisville high-school buildings and the laboratory equipment are not superior to the buildings and general high-school equipment found in Indianapolis.

But the discouraging and unfair part of the high-school organization in Louisville was discovered when a further analysis was made, showing that Indianapolis spent on its high schools but 17.7 per cent of its total revenue, while Louisville spent 27.3 per cent. At the same time it was found that Indianapolis expended $34 for every child enrolled in the elementary schools, while Louisville expended but $23.32. This difference between these two cities in expenditure for the elementary schools would be more than $250,000 or approximately $450 for every graded schoolroom in the city of Louisville.

As soon as the above facts were discovered the Louisville Board of Education began to take steps to reduce the abnormal cost of its high schools, and by the middle of this scholastic year, an addition had been erected at the Central Girls' High School building and the three girls' schools combined. At the same time, the Commercial High School was abolished, and the girls in that school were sent to the Central Girls' High School and the boys to the Male High School. As a result of this consolidation, the saving at the Central Girls' High School in salaries of teachers, janitors, matrons, and assistants will be this year in excess of $20,000, and the saving at the Male High School will not be less than $8,000. Furthermore, the enrollment of girls due to this consolidation has not decreased as some predicted; in fact, there has been an increase in the enrollment of between one hundred and fifty and two hundred.

But even yet the expenditure of 23 or 24 per cent of the school revenue on the high schools in the city of Louisville is abnormally high. If the two

high schools for boys could be consolidated and a new building erected to accommodate them, it is estimated that between $10,000 and $15,000 could be saved each year. This saving in Louisville is essential to the development of a modern elementary-school system, such as can be found in many of the cities of the Middle West. If this were done additional money could be devoted to the elementary schools, and thousands of boys and girls in the intermediate grades of our public-school system would not then be tempted to abandon their educational opportunities at the end of the compulsory age period. Instead, hundreds of our children would be induced to continue until the seventh or eighth grade, and better still, many of them would find it possible to complete the high-school course of study.

This disproportion in expenditure for elementary and secondary education in Louisville is probably no greater than it is in many other cities of this country, and therefore it will be of interest to boards of education in other places. This disparity in the expenditure of school revenue of course can in no sense of the word be considered typical but will serve to emphasize the need of a more careful estimate of our expenditures for the various school departments.

Certainly we cannot assume that a child in the elementary school is not just as important to the welfare of a community, or to a state, as is a child enrolled in one of our high schools. It is true that the leadership of this country comes from the young men and women who continue their education thru, if not beyond, the high-school course, but the foundations of our social structure are dependent upon the education and guidance of the thousands upon thousands of boys and girls whose economic efficiency and whose social and civic ideals are based upon the work of elementary schools.

Fortunately it will not be long until we shall have some definite standards to set up in estimating the relative amount of money that should be spent for elementary and secondary education, and even on the newer phases of public-school work. Dr. Harlan Updegraff, specialist in school administration of the Bureau of Education, has just made a careful study of the expenses of school systems in cities of 30,000 inhabitants and over. This publication will be ready for distribution within a few weeks. In it Dr. Updegraff states that the object of issuing this publication is primarily "to provide those charged with the administration of public schools in the largest cities of the United States the means of making exact comparisons of cost between any two or more cities." In my opinion this is a most valuable contribution in the field of school administration.

Of the 184 cities in the United States in 1910 with a population of 30,000 or over, Dr. Updegraff has made a minute study of the school expenses of 103 of these cities. In order to make more careful estimates, he has divided these cities into four groups, according to size. Two of these tables "show in detail for each city the annual cost per pupil, based on enrollment,

of each kind of expense for instruction, operation, and maintenance of elementary and secondary schools."

After presenting his data, the author raises the question, "What is the range of a proper ratio between average costs of elementary and high schools?" Taking the detailed facts concerning the school expenditures in the 103 cities he studied, Dr. Updegraff states that the best, or at least the most representative school cities—those within the middle 50 per cent of the distribution—spend from $1.80 to $2.60 per high-school child as against $1.00 for every child enrolled in the elementary schools. The median city spent $2.16 upon its high school for every dollar spent on the grades. If this standard could be enforced in many of our leading school cities, the question of elimination and retardation would not give us so much concern, for certainly more children would be saved to the schools and advance more rapidly in their work. Most of us will agree with the author of the bulletin when he asserts:

> In some cities it would be a far better distribution of public funds to take away from high schools having high average cost and high percentage of funds devoted to them and add the same to the broadening of courses in the elementary schools in order to meet the needs of those who are backward or who are losing interest in the present curriculum.

ROUND TABLES

ROUND TABLE OF STATE AND COUNTY SUPERINTENDENTS

TOPIC: AGRICULTURE IN THE RURAL SCHOOL

THE EDUCATIONAL VALUE OF AGRICULTURE

EARL BARNES, LECTURER ON EDUCATIONAL TOPICS, PHILADELPHIA, PA.

Education is everywhere today turning from the predigested forms of knowledge found in books to the real things found in life, from an exclusively intellectual training to developing and disciplining all the powers of the individual. In this movement new groups of activities are being selected and organized as educational instruments. Nature-study, industrial or vocational education, plays and recreation centers, practical civics, and agriculture are among these new lines of study now being urged upon the attention of educators. Of these subjects, nature work and the activities gathering around recreation centers have been pushed forward primarily because of their supposed immediate value to the children. Industrial or vocational training, practical civics, and agriculture have more commonly been urged because of community needs, tho they have also been supposed to possess educational value for the children.

The aim of this paper is to ask what agriculture, as a subject of study, really does to the children who pursue it. And by the study of agriculture we do not here mean the working-over of textbooks or lecture information about climate, soils, plants, and products —we mean, instead, lessons under competent direction, mainly out of doors, in which the children work with real soil; prepare it for planting; select, test, and plant real seeds; cultivate, water, fertilize, and protect the plants that spring from their seeding; and gather and use the products of their labor. If pets and domesticated animals can be added, the possibilities of training are greatly increased.

As a subject of study for children, agriculture has an evil record which it must outgrow. Children all over the world are fleeing from the farms to the city. Isolation, monotonous drudgery, lack of social and spiritual stimulus have made work on the land a thing to be dreaded by all who long for life more abundantly. But we are not here discussing the evils associated with farming for profit, nor the desirability of farming as a business, nor even the need of the community for intelligent and happy farmers. We are discussing the effect of lessons, planned for educational results, not for farm profits, conducted in pleasant school gardens, and on neighboring farms, and stopping short of the empty weariness that makes many of us remember our childhood with pain and regret.

In the first place, then, such a study of agriculture as we have indicated commands from the start a wide range of the interests most common to children. School children are active, concrete, and personal in all that they think and do, as compared with adults. Planting and cultivating things appeal at once to all their native interests. There is something doing all the time; the children are studying concrete things that can be seen and handled; and each child has a steady personal relation to the things he plants and protects or neglects. Even the child's native desire for struggle and contest is amply satisfied thru rivalry with his fellows, and the incessant fight against sterility or overgrowth, drought or excessive moisture, pests or thieves. In most of our older school studies, these interests have to be awakened by indirection and maintained by artificial expedients. In agriculture, they spring to the front at once and the teacher has only to use them. In a word, the study is deeply attractive to normal children of all ages.

Probably all thoughtful educators will agree today that sound education consists in receiving impressions from the external world thru end organs of sense, passing them along afferent nerves to ganglia of nerve cells, where they are registered as images, and generally also compared and associated with other memory images, and then the impulse is passed out along efferent nerves to muscles, producing activity in some way corresponding with the impression originally received. To put it differently, good education, especially in the earlier years, should give the children a body of significant impressions, should lead them to register these as memories and work them up in associated groups and reasoned sequences, and should then pass them over into appropriate expressions.

In the study of agriculture the child is compelled to repeat this cycle again and again. When he walks into the school garden, he observes the soil of his plot, and probably feels it with his hands; he registers these impressions as memories, compares them with impressions of adjoining plots, and then these registered and associated impressions pass over naturally into expressive action with spade or hoe or rake. Again, when he examines the seeds, he gains a body of agreeable impressions thru eyes and hands; these impressions are mentally registered, compared, and associated with memories of other seeds just used or about to be used, and then the impressions pass over into vital expression thru planting.

These cycles are repeated in endless variety across the period of growing a crop. Think of the varied experience from plowing, or spading, thru planting, thinning, transplanting, watering, fertilizing, fighting pests, to gathering and using the produce. When used only for educational purposes, each process can be maintained long enough to give drill and discipline, and yet stop short of the physical weariness and monotony that would destroy the best effects of the training. Meantime, each of these cycles grows out of those that preceded it; and all form a deeply significant series.

Ordinary school tasks give the fundamental cycle of impressing, registering, and expressing only most imperfectly. Even nature-study, so far as it is not agricultural education, whether it is conducted in the museum or in the field, must fall short of actually growing things in which the child is so personally interested. And it is only by passing thru this cycle again and again that the child is prepared, when he becomes a man, to examine, judge, and act.

To approach the whole subject from a different point of view, while the work is new, and before any of the processes have become habitual, a very wide range of mental powers is called into use. As the child digs in the soil, he is forced to observe the hard and the soft, the wet and the dry of loam, clay, sand, and gravel. He sees, feels with his hands, and works in impressions thru the play of his muscles. The inevitable slowness of the process gives time for the impressions to sink in and become permanent. Impressions received while spading up the garden bed are more liable to remain in the mind than those gained in most classroom recitations. So when he comes to plant the seeds, the child sees and handles attractive objects, having definite shapes, agreeable colors and lusters, striking or agreeable tastes. He watches, that is, observes, the earth intently, waiting for the first shoots to come forth. Increased growth and new leaves multiply the impressions. Pests call out intensive observation; he watches the sky for rain; and the final crop rounds out a wonderful series of significant, graduated, related, repeated, and varied observations.

Measures and comparisons are forced upon the child in the agricultural lessons at every turn. In the world of nature, law is supreme, tho no two things are ever the same; and the differences in richness of soil, in rapidity of growth, and in size of products are backed by desire to gain or fear of loss which quicken the processes of the mind. The surface of the plot must be measured, the length of the rows and their distance apart, the rapidity of growth, the part that survives and bears fruit, the quantity of products, and the amount of work, all call for exact statement.

Passing judgment on these observations and comparisons is also forced upon the child. Shall he grow beans or corn? If corn, shall he plant it on this end of the plot or the other? Near his neighbor's corn or away from it? Has he watered it enough or would more be better? Will this plant bear transplanting? How can he do better next year? In working with real and growing things, in which he has a personal relation, all of a child's mental powers are called into play to an extent hardly possible in the artificial exercises of the schoolroom.

With the older children, the problems of soil composition, proper fertilizers, development of useful varieties of plants and animals; fertilization; food values; geographical distribution of plants and animals; working-up of agricultural products, and economic and social problems offer an endless field calling out all the powers of the mind.

On the moral side, lessons in agriculture can admirably train a child in all the humbler virtues of life. He must be careful, exact, patient, and persistent if he would eat of the fruits of his labors. He must work beyond the point of pleasure; and he must wait beyond the span of a child's vision. He must protect his own plot and respect his neighbors'. Above all, he must bow to eternal law. When he neglects to water his plot and his plants fail, there is no chance to complain of unfair discrimination and shift responsibility to others' shoulders. Nature has marked his recitation with a zero and against that decision there is no appeal. He is taught to worship at the shrine of Necessity, and he thereby finds his place in the universe.

So on the artistic side, he may make his plot a perfect oblong or a square. He may have the rows straight or round, the soil free from weeds, well worked, and evenly distributed. He may surround his plot with a good walk, well kept. He may arrange the plants in agreeable groups and he may beautify it all with flowers. All the elementary problems of form, color, and proportion may be realized in the individual gardens, and in the groups of gardens; and so the foundations of a sense of beauty may be laid.

On the social side, too, there is abundant opportunity for emulation and co-operation. Plants will be started in a common hot-bed. The children will lend or borrow each other's seeds, plants, tools, and labor. It is a place where each for himself and each for all wins. The older children will see, too, the relation of their crop to the life of man. They will see that the earth is the mother of us all; that all we have comes from her bounty; that no child born on the earth should be shut away from the use of the earth.

And yet, as a training for life, agricultural education has very definite limits. It gives most superior training in elementary processes of mind, feeling, and character, but it needs wide supplementing. The farming population has always furnished strong basal energy for higher civilization; but the arts and sciences, social sensibility, and power of co-operative action have been developed in the towns. The Roman Cato is the type of agricultural product in the past; hardy, unbending, persistent, frugal, and just, but lacking in imagination and sympathy, he and his kind lay the foundations of empire; but such energy must be passed thru Athens to develop the higher life. Of course, the application of science to farming will lift the level of agricultural life; but the elemental forces of nature cannot yet be sufficiently brought under control by science to prevent their shaping those who deal with them to their own qualities.

Agriculture teaches boys and girls to work, but they also need to learn how to play. School gardens are laboratories of conduct, but the playground is a more advanced class. In the school garden Nature rules with an iron rod, but in the playground the child's spirit finds the open. Soil will be just; but the leader in the games may be generous. Hence every school garden should have as a neighbor a recreation field.

Agricultural education trains observation, comparison, and good judgment; but it discourages pure reasoning. Whatsoever a man soweth that shall he reap, if he does. Storms, drought, or blight may determine the conclusion as well as a major premise of intelligent care. Any farmer who thinks must be a pragmatist, with strong tendencies toward determinism. But meantime the children have minds that are rational and that move independently of storms or drought. Hence they should have pure mathematics, logic, and languages.

And on the moral side, Nature is carelessly fecund, shamelessly prodigal, or niggardly. Of man's higher justice she knows little; and of his mercy, nothing. From his lesson in agriculture, the child should turn to the Sermon on the Mount if he would see the whole circle of man's possibilities.

In fact, for all the larger and freer vision of life the child must leave his garden and go to the mountains and the sea, into man's heart thru history, biography, and literature, into his dreams thru philosophy, music, and the arts.

Our trouble in the past has been that we have tried to take our school children directly into this abstract world of exact thinking and exalted feeling without passing them thru the preliminary stages of concrete experience, elemental virtues, and active self-expressions. Lessons in agriculture will give this fundamental training on which all the higher development of the faculties must rest.

THE NEXT STEP IN TEACHING AGRICULTURE IN RURAL SCHOOLS

E. C. BISHOP, SCHOOLS SECTION, IOWA STATE COLLEGE, AMES, IOWA

There is no common next step in the teaching of agriculture. There is no common next step in teaching any subject.

Dr. Gulick says that there is no common normal condition which may be applied to all children. Associations, hereditary influences, temperament, environment, previous conditions, past experiences—these combine in the determination of what constitutes a normal degree of development which might be called a measurement of human development at any particular period in the case of each individual.

The "next step" implies a step already taken. The next step has direction, speed, form, and objective point. These are determined largely by the previous steps taken, by the condition of the pathway, and by the existing weather and other environmental influences.

The teaching of agriculture has experienced a wonderful development in the short time in which it has been given general recognition. But that development has not been

uniform in kind, quality, or rapidity. The development has been sporadic. It has been by individual teachers and other leaders, by school districts, by counties, by states, and by sections of the country.

Agriculture teaching so far has been largely a community affair, depending for advancement upon the number of local or community supporters, their enthusiasm, their powers of persuasion, and the disciples and help they have been able to gather about them and put to work.

Each succeeding community can and sometimes does profit by the experiences of other communities in the development of agricultural education. But up to this time, each community has had to pass thru much of the evolutionary stages of the work to be at the point where the best things in agricultural education might be applied. The ordinary stages of development are somewhat as follows:

1. Recognition that there are some facts, experiences, processes, and applications in agriculture practice which are worth knowing by all engaged directly or indirectly in agriculture as a business, and by those who have an associated interest.
2. Recognition of such knowledge and skill as real education.
3. That such education has economic value and cultural value.
4. That education in agriculture can be given in the public school.
5. That it has a defined body of knowledge and that it has a relation to other branches of learning.
6. That a place can be found for it in the public school without detriment to the teaching of the time-honored required subjects in their old theoretical forms.
7. That the subject merits the support it needs in order that it may be effectively presented.
8. That even tho it upsets some of the time-worn applications of pedagogy, it must have a place and a hearing in schools which train for citizenship, service, and happiness.

For the purpose of securing information which would help me to define the steps already taken in teaching agriculture and the direction and form of the next step which will help the teaching of agriculture to proceed in a direction and with a force that will reach some desired point, I sought opinions from some of those persons who are especially interested and acquainted with the subject by reason of personal experience or official position. I asked opinions of all state superintendents, a large number of progressive county superintendents, some directors of high-school agriculture, and from deans of colleges of agriculture. The replies were prompt, generous, and varied. I had thought of the next step as somewhat plainly defined. But the replies caused me to experience a somewhat dizzy sensation.

Taking thru imagination the next steps suggested, I found myself endeavoring to elect between forty-six different directions, kinds of steps, and styles of stepping. I found myself first stepping evenly from one position to the next, then leaping over a number of paces or turning backward somersaults; sometimes alighting in a dignified position on a footing at first seeming solid, then wabbling or falling off my mushroom support. Sometimes I was stretching for a forward reach or a backward extension or a side step both ways. However, it was very good exercise. I have some new pace measurements and know some new stepping values.

Recollecting my experiences with horses, of which I am more fond even than of teaching, I was caused to reflect that the short-legged Shetland, the prairie broncho, the well-rounded coach, the solid Percheron, the massive shire, the Hambletonian horse, and the Indian pony each have their ways of stepping—first, next, and afterward; that in the evolution of his kind, the horse yet furnishes us varieties—graduated in a more or less irregular scale from the wild horse who goes it alone to the groomed, trained beauty which requires the constant attention of a man who draws a salary as large as a house full of us pedagogs who do nothing more important than train boys and girls.

Returning to the evolution of agricultural education, I am led to reflect that, strange as it may seem to those who have been in the midst of the struggle for two decades, some communities in the, so to speak, unexplored parts, are yet enjoying the freedom of the

wild, free horse which neither supports nor is fed by man. Some communities are in the breaking-broncho stage and the tenderfoot riders are having trouble to keep their seats without "pulling leather"—sometimes not then.

I saw three women riders out at the Custer County fair in Nebraska last year. They were in a three-mile relay race. Two stayed on; one tumbled when the horse fell. An unkind man on the side-lines said that women should not try to ride horses. Only men can know how to keep going around a race track, which might be injured by French heels. Perhaps he was a school officer who yet thinks that only a man can teach agriculture.

Some communities are in the race-horse stage, some in the big draft-horse stage, some the family horse, and some no horse at all. Some ride in autos and some go thru the air.

The step differs according to the speedway, the furrow, the drive, or the pavement; according to the load, the driver, and the stage of evolution thru which roads, horses, loads, and drivers have passed, before the present combination arrived.

Agricultural education is just now growing surely but in patches, as the cocklebur and thistle of the field. It is in some places in the quack-grass condition, where a solid growth of healthy quack grass is disturbed by the plow and its seedling pieces scattered over the whole field, where it develops according to immediate relationships of nourishment and care—sometimes into healthy quack grass, sometimes just quack.

The replies received from more than a hundred school administrators indicate to some extent the stage of development of the respective communities represented. They include the first step, the beginning stages where the work is the arousing of an interest among the people thru farmers' institutes, extension work, contests for young people, county fair exhibits, and state and national aid as an inducement.

The next steps described are those leading to demonstration and experimental work, working with things, not books; providing better-prepared teachers, better-equipped schools, and workable courses of study with state, county, and township supervisors of public-school agricultural education. Some steps lead to the establishment of strong departments of agricultural education in state colleges of agriculture and in state normal schools, and to normal-training departments in high school with elementary courses in agriculture directed and taught by well-prepared men and women.

The replies so generously made to my inquiry are very interesting reading. They indicate conditions or degrees of advancement as well as opinions of procedure. Analysis of the opinions reveal two striking peculiarities: first, the diversity or variety of different next steps suggested—there were forty-six of these; second, the uniformity of opinions coming from communities which are enjoying the same comparative degree of development in agricultural education. I regret that I cannot read to you many of these well-worded, carefully thought-out opinions, offered by men and women who have great interest in this subject.

The next steps suggested include everything in agricultural education from a boys' corn contest to a college course in agriculture. They include method in all its stages from story-telling to well-equipped laboratories and field experiments. They include activities from the dainty teacher who must put her hands into the soil, to the township, county, and state special directors of agricultural education work.

They include equipment from an empty crayon box to fully correlated and equipped, specialized courses of study from the kindergarten to the college-graduate work. They include reorganization work all the way from timidly asking for a hearing under an assumed name in the nature-study, geography, physiology, botany, physics, chemistry, zoölogy, spelling, language, reading, and arithmetic classes to the urgent demand for a complete reorganization of the entire courses of study so as to give agriculture its proper place in the great scheme of education.

These opinions ask for assistance all the way from a rural-school officer's friendly attitude to state and national aid and drastic legislation which would force the teaching of the subject all at once everywhere whether teachers are prepared or not and without

the consent or the interest of the parents. They include desired literature all the way from picture cards and ready-made charts to impeachable textbooks and encyclopædias which never become out of date.

But I have already given you the summary which indicates as great a diversity of steps as there are conditions of advancement in the work of communities.

Each community is ready for the next succeeding step as previously indicated. Some communities take two or three of these steps at once, then proceed forward with a backward form of step for a distance in order to slacken their pace with dignity and prevent retreat until the foes in front grow weary (and wiser) and the good folks in the rear catch up.

But the general onward march is with about the same formation and speed except in those places where an especially strong leader breaks away with his followers and enters the newer field on his own initiative and responsibility.

But I was to point out the next step. This next step is the one for which the most advanced communities are now ready. The other "next steps" demanded have already been taken somewhere. The step called for by far the greatest number of educators whose opinions I sought is the important step which must now be taken if the teaching of agriculture in rural schools or in high schools is to be given properly. It is that of the better preparation of teachers for the work. Better teachers with better training in agriculture is the crying need just now which must be met if the work is to be advanced, or even saved from disastrous affliction.

The demand for the teaching of agriculture in the communities where the preliminary work has been done is already much greater than the present number of properly prepared teachers can supply. We cannot, and would not if we could, stifle the demand for agriculture teaching. It is a healthful cry for hygienic educational nourishment. We must provide the required teachers. These teachers must come from strong departments of agricultural education in colleges of agriculture to supply high-school and normal-school teachers of agriculture. They must come from normal schools to supply grade teachers in towns and cities and village high-school teachers. They must come from normal-training high schools to supply teachers for the rural schools. The rural schools' greatest hope just now is the courses of normal training provided in high schools for the elementary training of those persons who are to become rural-school teachers. New York state, Nebraska, Kansas, Minnesota, and Iowa are some of the states already doing this and the good work is spreading and growing within.

While we are preparing these needed teachers, we may well be working out better courses of study in agriculture not only for rural schools but for all public schools. Agriculture as a subject has not yet settled down into its proper place in the public-school curriculum. A shifting of the entire science course and a better correlation with other branches are the movements under way which will require the second next step after we take the one now needed in the better preparation of better teachers for the rural schools.

DISCUSSION

Reed B. Teitrick, deputy superintendent of public instruction, Harrisburg, Pa.—The growth of agriculture has modified the civilization of the world. It has been a factor in abolishing cannibalism, producing slavery, and modifying governments. The "nest places" of civilization and the homes of the classic nations have been the garden spots of nature. This morning more than ninety-two million people in the United States awoke and turned their faces to agriculture for their breakfasts. How many domestic animals—mute partners of toil—were fed from the same source cannot be accurately stated. Can such a subject be without some educational value? Comenius said that as far as possible men are to be taught to become wise not by books but by the heavens, the earth, oaks, and beeches; that is, they must learn and examine the things

themselves and not the testimony and observations of others about things. Children are raw material waiting to be developed. Agriculture is one of the chief subjects which links man to mother earth. It employs the hand as well as the head.

Nature has been man's teacher. Nature-study is the starting-point in teaching agriculture. I do not mean a weak sentimentalism about nature-study. I mean that power which comes from seeing, handling, and making things and drawing proper conclusions from the impressions gained in these ways. Whether agriculture shall have an educational value or be mere speculative theory depends wholly upon the way it is taught. There must be a sharp distinction between teaching city children the most elementary fundamentals which they need, and the classification and application of scientific principles based upon facts which rural children already possess.

There are two basal laws of teaching and they are equally applicable to theoretical and to applied education. They are, first: that the learner must be taught on the basis of what he knows, and second: on the basis of what he does. Teachers of today are not satisfied to fire blank cartridges; they want to hit the bull's-eye. We *must* look to those forms of education, then, which end in something and express themselves in some form of human activity. Agriculture does this. It relates the student vitally to nature and to life. It is active and constructive. It is rich in human interest. It is only by appealing to a child's knowledge and interest that mental growth can be accomplished. The old speculative problems of metaphysics are gradually being supplanted by the tangible methods of the laboratory. The study of agriculture not only affords opportunity to make use of the principle that interest in life-forms precedes that of interest in inanimate nature and abstractions; but it also accomplishes another important object of modern pedagogic endeavor—that of increasing the unity and joint interest of the rural school and of the home. Agriculture employs the time and claims the attention of more than one-third of our population. It feeds us all; and as we have already observed, the future of a people depends upon the productions of their soil.

If the teaching of any subject is to be effective it must bring about a close adjustment to life. If it is real it will be educative. If it is educative it must have to do with real things. The student soon learns that cause and consequence are inseparable and certain; that the forces of nature are allied with him in his struggle for mastery and that results cannot be doctored. I believe the study of agriculture will bring about a changed attitude toward life. It will broaden and deepen the channels of thought and instead of walking as heretofore, blindly amid the great forces of nature, we shall see order and beauty and law in the origin of the soil, in the summer shower, in the plant, in the flower, and in the fruit. Can a mind be brought into close touch with nature day after day, feeling the influences of its beauty and grandeur and blessings, without being lifted to a higher plane of thinking and living? Improvement of mind comes from the exercise and expansion of the power to perceive and reflect, from habits of attention and application, from self-control and self-respect. How shall we have a harvest of thought unless we have a sowing of sense impressions?

Culture stands for the ability to appreciate the beautiful in art, in literature, and in nature; and the dignity of labor and true nobility of human conduct. Agriculture taught by competent instructors with suitable equipment, combining thinking with doing, is therefore one of the best means for mind-training, especially to those who have faith in the farm and rural life. To them in this subject the arts of the school are related to the arts of life, and aside from its economic value which certainly is not least, there are also the greatest possible educational and disciplinary opportunities. It not only awakens interest and gives purpose but it teaches industry and self-reliance. These are virtues that underlie all culture, character, position, and power.

Dean Davenport, of the College of Agriculture of the University of Illinois, gives seven reasons for teaching agriculture in the public schools. As they have an educational value I quote the following from them:

First: To cultivate the active and creative instinct, as distinct from reflective and receptive, that are otherwise almost exclusively exercised in our schools.

Second: To give practice in failure and success, thus putting to the test early in life the ability to do a definite thing.

Third: To train the student in ways and methods of acquiring information for himself, and incidentally to acquaint him with the manner in which information is originally acquired and the world's stock of knowledge has been accumulated.

Agriculture is well adapted to build up true American citizenship. It blends literary, ethical, scientific, and industrial training into a strong, sensible, inspirational scheme of education. It is social as well as scientific. It is unquestionably as stimulating to manly endeavor and moral civic excellence as ethics and kindred subjects which deal exclusively with the formal studies of education.

M. P. SHAWKEY, state superintendent of free schools, Charleston, W.Va.—The assumption is fair. Important beginnings have been made. Experiments have been conducted and reports printed and distributed. Books have been published. Laws have been passed requiring the science to be taught. Still the results have not been as big as we desired.

The great trouble with our teaching thus far seems to be that its effects have been confined to the towns and cities and to the colleges instead of its taking root in the country where it must operate if it is going to produce crops.

To reach the country we are now turning to the rural schools. We find, however, that to reform the agriculture of the centuries is a big job for so small an institution as the single-room country school. That school does not seem to get hold of the problem in such a way as to do the work. Yet no other school can do the work if it is to be done in the country.

What then is lacking in the country school? Evidently something, and we need not go far in an investigation to discover *one* cause of the trouble, and to my mind the chief cause of it.

So long as a majority of the teachers in the rural schools are girls merely graduated from short dresses, spending a few months in the schoolroom in waiting for their wedding gowns, we need not expect any very serious instruction in farming in those schools. Such conditions must be changed. We are laying a good deal of stress on the importance of training teachers to love their environment. We want them to appreciate country life. But we must never expect them to prize country school teaching more than life in their own home. If we teach them to prefer the veil to the wedding gown, we shall commit a grievous mistake. Great as is the need of these girls in the schools, greater is the need of them in the homes. Moreover, they are moved by a higher impulse and one which we could not change if we would.

The thing which we can and must change is the condition. Managing a school plant, whether it be an institution of a hundred rooms or one of a single room, is a man's job or a woman's job—not a girl's. We should not expect a young girl or boy, single handed and alone, to handle such a problem. When we equip the country school on a scale commensurate with the work we expect it to do and pay a salary that will justify a man or a woman in making a life-job of teaching, then we may hope to revolutionize the country; but we cannot reasonably hope to do so until a radical change is effected in the provisions made for the country school.

The average salary of teachers in the rural schools and grades thruout the United States is $50.00 per month for a year of less than eight months. Such standards are too low. We should provide a minimum salary of $75.00 per month for a minimum term of eight months. When that is done the country school will show more solidity, more vitality, and more influence in the community. It will be able to teach agriculture or literature or anything else for which the public exhibits a great need.

So long as we pay the chauffeurs, the janitors, the saleswomen and office girls, the mill hand and the miner, the policeman and the hotel clerk, more salary than we do the teacher, it will be necessary for us to continue asking, What shall we do to be saved? So long as we continue to pay the barber and the hairdresser more to shape up the outside of our heads than we do the teacher to mold the inside, just so long will the outside work be done better than the inside. We must not expect more of our schools than we put into them. As a nation we felt rather proud of ourselves that we spent $400,000,000 on our schools last year. But we forget that we spent a fourth of that amount for candy and chewing gum, three-fourths that amount for tobacco and cigars, and one and one-fourth that amount for alcoholic liquors. That is, we are proud that our schools are worth four times as much as our candy and chewing gum, one and one-third times as much as our tobacco, and 80 per cent as much as our Tom and Jerry.

While we have done well, yet I want to assert that there isn't a state in the union that has invested in its schools up to the maximum of profitable investment. But if you get down close to the taxation district you will hear a complaint about taxes and the people will ask, Where are we to get the money? It might be to the point to answer, give up a little of your candy and chewing gum, your tobacco and your gin and toddy, but possibly that would be asking an unreasonable (?) sacrifice, so let us say, give up a battleship or some of your extravagance in federal buildings. Perhaps we might act on Professor Bagley's suggestion and reverse the process by supporting our schools for awhile on tariff revenues and run the government by direct taxation. Soon after we do that there will be a volcanic eruption, but the schools will come out of the turmoil bigger and stronger than they have ever been before.

As a step in the right direction, let us have a federal appropriation of at least one dollar per capita for every child of school age in the nation. Make it contingent upon each state, raising a fixed sum per capita also, if you please, but at all events let us have the money and invest it in our schools. Then we may justly ask those schools to do the greater work for the nation for which economists declare there is so great need at present.

As a second step let the taxes on railroads and other public-service corporations be collected by the state and distributed thruout the state on the per-capita basis instead of being bunched in the districts where such corporations happen to operate, as is the case now. These two plans would fill up the country treasuries and enable the rural districts to pay such salaries as would attract and hold strong, experienced teachers. They would be enabled to provide proper equipment and proper supervision with the result that the schools would take a potent part in teaching agriculture, in promoting the good roads crusade, and in fighting the battle for public health.

ROUND TABLE OF SUPERINTENDENTS OF LARGER CITIES

TYPES OF SPECIAL SCHOOLS IN THE LARGER AMERICAN CITIES

ANDREW W. EDSON, ASSOCIATE SUPERINTENDENT OF SCHOOLS, NEW YORK, N.Y.

Your chairman invited me to make a summary of the movement in the large cities of this country during the past ten years toward the establishment of schools for the education and training of special groups of children.

In complying with this request I confine myself largely to a consideration of the so-called exceptional children, partly because of the time allowance—twenty minutes—and partly because of the magnitude of the problem.

At the meeting of the National Council in 1907, the president appointed a committee of five, Messrs. Van Sickle, Edson, Pearse, Wolfe, and Fitzpatrick, to make a report on the provision for exceptional children in the public schools of this country. At the Cleveland meeting of the Council in 1908 a preliminary report was presented with the

recommendation that a committee be appointed and an appropriation made to continue this tentative study, but owing to a real or imaginary scarcity of funds the appropriation was not made and the work of the committee ceased. The work, however, was taken up two years later by Messrs. Van Sickle, Witmer, and Ayres under the auspices of the United States Bureau of Education, the result of whose efforts is embodied in *Bulletin No. 14*, 1911, recently issued.

In order to secure the latest information on the progress made in this line during the past few years, I addressed a circular letter of inquiry a month ago to the superintendents of one hundred of the leading cities in the United States. The following is a copy:

1. Does your city make provision for the education and training of (1) truants, (2) incorrigibles, (3) mental defectives, (4) the backward, (5) rapid advance, (6) blind or sight defective, (7) deaf or hard of hearing, (8) crippled, (9) tuberculous, (10) anæmic, (11) stammerers, (12) epileptics, as a part of its public-school system? In what year was provision made for each?
2. Which of these classes are cared for in buildings apart from so-called normal children? Which in school buildings with regular grade work?
3. What special equipment is provided?
4. What special course of study is provided?
5. What special preparation is required of the teachers? Is any additional compensation offered?
6. What success has been attained in this work so far as you have observed?
7. Is the sentiment in your city favorable to an expansion of this work?

From the 75 answers received I find that 32 cities are making special provision for truants, 31 for incorrigibles, 31 for mental defectives, 32 for the backward, 19 for the rapid advance, 9 for the blind or sight defective, 15 for the deaf or hard of hearing, 7 for the crippled, 14 for the tuberculous, 14 for the anæmic, 6 for stammerers, 2 for epileptics, as a part of their public-school system.

The point of special interest in these returns, however, is the surprising fact that in 25 of these cities no provision whatever is made for the education and training of any of these exceptional children, while 12 cities confine their attention specifically to but a single class, as follows: 5 to truants and incorrigibles (classifying them together), 5 to backward pupils, 1 to advanced pupils, and 1 to tuberculous. This confession is a sad reflection on the superintendents of the cities where the exceptional children are so neglected.

In a few cases truants and incorrigibles are committed to country truant schools (as in Massachusetts) and in most cities, as yet, mental defectives, the blind, and deaf are committed to state or private institutions.

Some of the replies to the question, "Does your city make provision for the education and training of exceptional children as a part of its public-school system?" were as follows: "This city has no schools of any of the classes named in the circular—*wish it had*." "The matter has not yet received much consideration." "This city should probably be classed as 'backward,' I regret very much to say." "There are no indications of any sentiment in favor of the expenditure of money for the education of these exceptional children—it surely would be favorable if aroused." "There are hardly enough of these exceptional children to warrant the organization of special classes." "Our board of education has recently adopted a system of medical inspection which will probably lead up to some special instruction of defectives." "We expect to make a beginning soon."

The problem, therefore, is not yet fully solved. A good beginning has been made—only a beginning, however. In cities where any provision has been made for the education of these children, it is clearly evident that but comparatively few as yet are cared for in our public schools. The children are with us, and public sentiment can be aroused easily if the superintendent is at all interested.

From the answers to the question, "Which of these classes are cared for in buildings apart from so-called normal children, and which in buildings with regular grade work?"

I find that where provision is made by the school authorities for the education and training of these exceptional children, there is a wide difference in the plan of housing them. Some are in regular school buildings and some in separate buildings apart from normal children as follows:

	In Regular School Buildings	In Buildings Apart
Truants	10	22
Incorrigibles	12	20
Mental defectives	24	10
Backward	27	5
Rapid advance	16	1
Blind	7	2
Deaf	8	8
Crippled	4	4
Tuberculous	5	10
Anæmic	9	6
Stammerers	6	0
Epileptics	1	1

In a few cities both courses are followed, some of the exceptional children being cared for in school buildings where the ordinary grade work is carried on and others cared for in separate buildings.

It is clearly evident here that in many cases the ideal is obliged to yield to the feasible. In many places the regular school buildings are crowded, children by the hundreds, even thousands, obliged to be content with part-time instruction. In such cases it is a grave question whether rooms in the present school buildings should be taken for any of these exceptional children and thus increase the congestion. On the other hand, if some rooms or buildings under the control of the board of education cannot be secured where a beginning may be made at once, that beginning possibly may be deferred for years. The part of wisdom, therefore, seems to be to utilize for these exceptional classes vacant rooms in regular school buildings wherever found, or to take rooms already occupied, even if it necessitates part time in the first and second years. The first step to be taken is to find a room for the purpose. "Where there's a will, there's a way."

The argument for the segregation of truants, incorrigibles, and tuberculous children is based upon the protection and good of the other children. This argument will not hold in the case of other special classes.

In the case of mental defectives—and by this term is meant those children who are somewhat subnormal and yet capable of mental improvement (all imbeciles and idiots being institutional cases)—the advantages of providing for their instruction and training in regular public-school buildings are many. In the first place, these defectives are of all grades. Some of them are but a little off from normal, cases of slow development it may be, some of them are behind in only one subject, so that with individual attention in their studies and with much attention given to physical and manual training, they may soon gain enough to be allowed to go to regular classes at certain periods each day for instruction in the subject in which they show the most interest and greatest aptitude. Again, the opportunity to associate with normal children on their journeys to and from school, on the playgrounds, and in some of the general exercises of the school must be of the highest value to the handicapped. The fact that they are with normal children for a portion of the time must have a much more tonic influence on their mentality than would the realization that they are set apart as dullards. And, again, the education of these classes in regular school buildings provides accommodations for the children near their homes and is also an economical arrangement for the city.

The great argument in favor of having the blind and deaf instructed in the regular school buildings is that parents may not be obliged to make a choice for their children

between ignorance and institutional life. The training that they get in their intercourse with normal children is of the highest value. When parents understand the matter, they invariably choose the public school to an institution for the education and training of their handicapped children.

It takes but a short time for a blind child to learn to read and write by a system of raised dots and to use the Braille slate and typewriters. He is then assigned to a regular grade class with sighted children and does all the work except in writing and drawing. His written work is interlined by the special teacher and returned to the teacher of the sighted class for correction. Additional lessons in handwork and special exercises in corrective gymnastics are given by the special teacher. These children often skip grades and lead their classes. Their progress is marvelous. In the case of the deaf and blind the classes must be small—not exceeding ten—if the best results are to be obtained. The expense in carfare for these exceptional children, if the distance from home to school is great, is usually borne by the city. In the case of the blind the carfare of a guide must also be included.

In several cities the school buildings are used during the summer months for giving the boys and girls who remain at home during the long vacation an opportunity to engage in some form of vocational or industrial work, or of making up back work, gaining promotion to an advanced grade, or of strengthening themselves in their regular grade work. The plan of utilizing the school plant during the months of July and August is growing in favor from year to year.

The replies as to special equipment provided were varied, some of them being, "Such as necessity dictates"; "Material for handwork and constructive work"; "Largely manual and physical"; "Whatever the expert asks for"; "That is still one of our problems."

In nearly all of these special classes emphasis is and should be placed upon manual and construction work. The special equipment usually provided for a class of fifteen mental defectives, as large a class as can well be handled, is fifteen movable and adjustable seats and desks, four or six work benches and equipment, physical training equipment, a piano, and running water and porcelain sink if possible.

For classes of the blind there are usually ten adjustable seats and desks, type slates, drawing cushions, grooved rulers, a typewriter, textbooks with embossed Braille.

For classes of the deaf there are usually found ten or twelve movable and adjustable seats and desks, hand mirrors, a large mirror, vibratory tube, a guitar, tuning fork, Northampton charts, or some equally good for the classification of elementary sounds and for word drill, and many objects to aid in developing the sense of touch.

For the crippled there should be provided adjustable chairs of a special pattern, foot and leg rests, reclining chairs, and a couch.

For the open-air classes there are needed adjustable and movable seats and desks, reclining chairs, a scale for weighing and measuring, chair bags, leg blankets, soapstone foot warmers, worsted toques, woolen gloves, outside coats, and equipment for a simple kitchen.

For the crippled, tuberculous, and anæmic children, provision should be made by the school authorities or by outside organizations for medical treatment and nourishing food, and for a nurse to assist the school physician and to visit the homes. By this visitation the home condition can often be greatly improved.

The replies to my inquiry as to the course of study provided seem to indicate that in practically every city the greatest liberty of interpretation is allowed. Some of the replies were, "No special course of study is provided, but liberal modifications of the regular course are allowed"; "The work is adapted to meet the needs of each individual"; "The course is largely discretionary with the teachers of the classes, the health and mental ability of each child being the guide"; "Freedom of interpretation"; "Special attention given to the fundamentals"; "Manual training and industrial work predominates."

From these replies it would seem that in these classes the child rather than the subject is the center of interest, and rightly so. What a fine thing it would be to have this idea prevail in grades with normal children!

More flexibility, more liberty of interpretation, greater study of the needs of the individual, are the demands of today in schools where intelligence is at the helm.

The answers to the inquiry as to the special preparation required of teachers and the additional compensation granted indicate that skillful teachers from the regular corps are usually selected for the teaching and training of exceptional children. In this particular work the measure of success attained depends upon the teacher in charge, even more than with normal children who will make fairly good progress even when handicapped by merely passable teachers. In many cities the teachers of mental defectives are required to take summer school or extension courses at institutions for the feeble-minded, or to spend a few months in a careful study of the work of these institutions. The fact remains, however, that a large majority of these teachers have had little special preparation for the work.

Teachers of the blind and deaf must of necessity have had a special preparation, or at least must have studied for some months with teachers at work in such schools. Teachers of the open-air classes can readily be found from among those who have a slight inclination toward pulmonary complaints and need open-air work. Teachers of truants and incorrigibles must have in a marked degree firmness and a strong personality. In fact all teachers of these special classes should have a natural aptitude for the work—infinite patience, tact, resourcefulness, intense human sympathy, an appreciation of effort, and unbounded faith in the young people intrusted to them. Such teachers should also be students of the latest literature on the subject—which is abundant—and should make frequent visits to other schools where special instruction is given. As Dr. Johnstone well puts it, "We need above all else forward teachers for backward pupils."

In most cities additional compensation ranging from $50 to $150 per year is allowed teachers of special classes. This extra compensation, the small classes, and an interest in a special line of activity serve to bring volunteers to the front whenever teachers are needed.

The inquiry as to the success attained in the work undertaken met with the following responses: "The success is twofold—better individual progress and the rooms freed from the hampering influence of pupils who cannot be reached in the ordinary way"; "Marked gain physically, mentally, and morally to all pupils, and especially to normal pupils because of the segregation of the submerged tenth"; "Coaching of backward pupils caused 50 per cent to be promoted"; "Results with mental defectives have more than met our expectations"; "Some surprising results noted with pupils in every special class organized"; "Discipline thruout the system improved"; "Success has warranted a slow but steady expansion of special work, as the needs have been more clearly seen."

A few responses showed a little hesitation in claiming much success in training truants, incorrigibles, and mental defectives, but the answers as a whole indicated a deep interest in the problem and satisfactory results.

And to the last inquiry, "Is the sentiment in your city favorable to an expansion of this work?" the following replies were received: "Favorable to making provision for all classes named above"; "I have heard no adverse comment; newspapers are generally very much interested and give more space to our special schools than to any other"; "Sentiment growing gradually"; "Practically all of the parents are eager to have their children take advantage of the special schools, while practically all of the pupils do more than normal work in these grades"; "Some of the women's clubs and improvement clubs are quite enthusiastic over the care of these special classes of children"; "Strongly favor open-air classes, doubtful about truant schools"; "Yes, consistent with the tax rate"; "The only objection advanced is the expensiveness of the work"; "Finances and lack of room have retarded the movement"; "Conservatism has dominated here"; "The only

obstruction is an antiquated charter which does not give the Board of Education authority to include these activities"; "A few people are very much in earnest, the large majority are indifferent."

These replies state fairly well the efforts that have been made and the success attained in most of our large cities to provide an education for exceptional children. It is a fundamental proposition, tho not yet fully recognized in many communities, that every child is entitled to all the education he is capable of receiving. This proposition implies that it is the duty of the state to educate the subnormal, physically handicapped truant, and incorrigible child as well as the normal child, *irrespective of cost*. The birthright of every child is a place in the world and a training that will fit him to fill that place as successfully as possible—to be happy, self-respecting, self-supporting.

Time will not permit me to summarize the development of trade schools, commercial schools, manual-training and technical schools as a part of the public-school system.

I wish, however, to dwell for the few remaining minutes on a line of work that is being carried on by the Board of Education of New York City in an earnest attempt to solve the problem of industrial and vocational training for boys and girls who will drop out of school as soon as the law allows. These vocational schools admit graduates of the elementary schools on presentation of their graduation cards, and under certain conditions other pupils who have not graduated, provided they are fourteen years of age. As a matter of fact, only about 60 per cent of the attendance in each school are graduates of the elementary schools.

The school for boys is designed for boys who desire a preparation for industrial work as distinguished from office work. The particular vocational subjects offered to boys are wood work, including house carpentry and construction, cabinet making, and bench work, wood-turning, pattern-making in wood, and the use of wood-milling machinery; metal work, including general machine-shop practice, sheet metal work, forging, plumbing, molding, and pouring patterns; electric wiring and installation; printing, including estimating costs, imposition, composition, and presswork; and bookbinding.

In addition to learning the elements of a trade, the boys are given a thoro course in free hand and mechanical drawing, industrial design, and the making and reading of blue prints.

The non-vocational subjects taken by all are trade mathematics, including arithmetic, the use of symbols as found in elementary algebra, and plane geometry and trigonometry as used in the trades; English, including business letters, reading, drawing of contracts, and written specifications; industrial history, civics, industrial and commercial geography, applied physics, industrial chemistry, simple bookkeeping, and the elements of commercial law. In connection with their regular work the boys are taken to visit museums, lumber and supply yards, industrial plants, factories, and construction jobs; and representatives of various activities are invited to address the boys from time to time on the topics in which they specialize. Thus the work of the school is made eminently practical.

It is probable that the activities in this school will be increased in the near future by the addition of auto-repairing, sign-painting, electric power machinery, photo-lithography, monotype and linotype operating in the printing department.

The course of instruction in this school is designed to increase a boy's earning capacity by giving him a training which he could not hope to secure if he started to work as an unskilled apprentice. It gives him an introduction to all types of machines and so enables him to avoid being a one-machine man.

The length of the course is two years, tho only one year for the printing course. The school is open every month in the year except August. The school day is from 9 A.M. until 5 P.M., lengthened to accustom the boys to the realities of the business world. Trade drawing and the non-vocational subjects occupy about one-fourth of a school day.

Evening sessions in this school were opened this month for the first time and over 750 boys registered.

The Manhattan Trade School for Girls offers an opportunity for girls to learn to be skilled workmen in a short time and in a larger and more intelligent way than thru trade training alone.

The vocational courses offered to girls are (1) electric power operating, including general operating, shirtwaist-making, children's dressmaking and underclothing, women's underwear, kimonos, and dressing sacques; special machines for hemstitching, buttonhole making, and embroidery; dressmaking, operating in lingerie, fancy waists, and suits, and straw sewing in women's and men's hats. (2) Dressmaking, including uniforms, aprons, white work, simple white embroidery; gymnasium and swimming suits, and dresses. (3) Millinery, including elementary work for assistants, improvers, frame-makers, and preparers. (4) Novelty work, by use of paste and glue, in sample mounting, and sample book covers, labeling, jewelry and silverware cases, lamp and candle shades.

In addition to the vocational courses named above, all pupils take a course in elementary and advanced art, adapted to the work of the trade departments, and pursue such non-vocational subjects as business arithmetic, business English, industries, and textiles, civics, ethics of the trade, and the cost of living, and receive physical examinations and treatment, invigorating, corrective, and recreative exercises, and talks on hygiene and health.

A placement secretary advises the girls as to the kind of work they are to take up, keeps a close watch upon the trades in order to know the kind of work for which there is a demand, recommends girls to places, and keeps a record of them after they enter a line of work.

The length of the course is one year. The school is open every month except August, from 9 A.M. until 5 P.M. each day. The school is crowded to its fullest capacity, the maximum attendance being 400.

The main expense connected with these schools is in the equipment. In the school for boys much practical work is done for the Board of Education in printing, bookbinding, wood-working, repairing, electric wiring, and plumbing, which materially reduces the per-capita cost. In the school for girls the sale of articles amounts to more than $1,000 per month which is turned in toward the support of the school in the purchase of raw material and supplies. In fact it is expected that the school will be nearly self-supporting this year.

In view of the progress that has been made of late in organizing special schools, and of the light that has been thrown on the efforts put forth, I beg leave to offer the following suggestions for the consideration of the superintendents of our larger cities:

1. We have but just entered upon a great movement. As yet we have not grasped the problem, merely touched it with our finger tips. On one plea or another—lack of funds, lack of rooms, lack of trained teachers, or lack of public interest—we superintendents neglect our opportunity and content ourselves with providing for the education of normal children only, or at least of a comparatively few of those who need special courses and special training.

In any city of ten thousand or more inhabitants there are pupils enough for classes in all the groups named, save possibly epileptics, pupils that should be segregated and be given attention and instruction that will best meet their needs.

2. With the exception of truant, incorrigible, and tuberculous children, the classes can best be organized in regular school buildings. In this way the rooms can be secured quickly, the expense will be greatly lightened, and the children will be favored in the distance to be traveled and in their association for a portion of the day with normal children.

3. A beginning may be made thru the department of health. Medical school inspectors and school nurses should open the way thru their investigations and reports to the need of special care and instruction of exceptional children.

4. The superintendent should insist upon small classes and skilled teachers for exceptional children, even if the cost is large. In some cases, as in the education of the

blind, the per-capita cost will be increased four or five times, but it will be money well invested. The people will not begrudge the expense when they understand the work carried on.

5. School buildings should be open thruout the summer for the accommodation of those children who remain in the city and desire to make up back work, to strengthen themselves in regular class work, or to take up some line of industrial work. It is surprising how many children will take advantage of the opportunity to attend vacation schools when the opportunity is offered.

6. For those boys and girls who *must* leave school at an early age to engage in some line of industry, the city should establish vocational schools that will offer practical courses in various lines of industrial activity to all who are fourteen years of age without regard to their academic training or to the fact of graduation from any school.

7. If the board of education cannot secure the necessary funds for the support of any of these special activities, there are, thank God, people of means and warm hearts in any community who will respond to any reasonable appeal for financial support of the schools named above. All that is needed is a superintendent of positive ideas, warm heart, good sense.

8. And in undertaking work along any of these lines, we superintendents should do more than be satisfied to care for the few exceptional children on our hands at the time. We should study causes, methods, treatment, progress, results, and inform the public of the same as well as pass along our experiences to our neighboring fellow-workers for their guidance and direction.

A DEFINITE PROPAGANDA TO IMPRESS UPON THE AMERICAN MIND THE NECESSITY OF AN EXPANSION OF THE FIELD OF EDUCATION TO PROVIDE AS AMPLE FACILITIES FOR EDUCATION BY WORK AND EDUCATION BY PLAY AS ARE NOW PROVIDED FOR EDUCATION BY STUDY

M. G. BRUMBAUGH, SUPERINTENDENT OF SCHOOLS, PHILADELPHIA, PA.

(*Abstract*)

I am constrained to present to you as an introductory thought a general statement of the educational outlook today.

The educational mind never sleeps. Year by year it works over its formerly accepted guidance and recasts it. Year by year it reaches out and up for new activities and wider functions. The entire educational world is in constant flux. No traditional processes escape the challenge of honest inquiry. No school law or procedure is so sacred that it is not subjected to new tests and forced to justify itself in the light of changing social, economic, and ethical order. This is a sign of life, and not of decay; of hope, and not of despair; of progress, and not of stagnation. The thing we call education today is a vastly different thing from the concept of a generation ago.

New influences of moment are likely to arise at any time and among any people. There is no zone of exclusive educational propaganda. The world of civilized men is the schoolmaster's workshop. The reporter of educational activities must sit with clear vision and open mind within the educational watch-tower and view impartially the passing pageant. He will see much that is ordinary and commonplace, traditional and unworthy; but he will see here and there the unmistakable signs of activities that hold in their compass rich promise of hope and help to childhood. These he seizes upon, analyzes them, relates them to accepted practice, squares them against great guiding laws, and indicates but does not seek to vindicate their right to be. He wisely submits his evidence to the great jury of thoughtful educators and the still greater jury of human adjustment.

This seems to be the present status of our educational polity. We are asked by the theme under discussion to broaden the day's activities to include not only study but also

work and play. This concept of the school's function greatly broadens the activities of our present-day schools, but it likewise demands a new understanding of the place of education in the life of the individual. This is especially true in great urban centers where, by the refinements of industry and the restriction of free activity, such a type of training is essential to the welfare of the individual.

In one city with which I am familiar, I found that the wise propaganda is the direct appeal to the people. Some years ago the superintendent called to his assistance a group of unselfish and capable citizens to consider the importance of providing play and recreation for the children of the city. In four years this propaganda secured above twenty playgrounds, maintained summer camps, secured from councils funds for a commission to study and report upon needed play provisions for the city, had an act passed by the assembly creating a board of recreation, and influenced the city government to make provision in its loan items, to the amount of a quarter of a million of dollars, for play activities. Today this city is well on the way to as ample provision for play as it has for study. All this was done by appealing directly to the people, and the people demanded and secured the splendid results indicated.

I take it that some such propaganda for industrial training in the schools will produce equally desired results. In Philadelphia we now have such provision for about 70 per cent of our pupils thruout the elementary grades. That the trend of educational thought is in this direction seems obvious to anyone conversant with world-activities in education.

If one were to indicate a movement more radically different and yet more largely promising than another, it is the general movement that in one form or another endeavors to make the school an opportunity not only to study but also to work and to play. The purpose of this movement is to provide by study the essential tools of thought and of expression, and by work and by play to relate the individual definitely with the recreational activities of maturity. The vocational propaganda has achieved substantial recognition. The recreational activity, deep fraught with moral purpose, is steadily sweeping forward. It is just as essential to a stable social order that the individual should know how to spend his recreational hours as it is to spend his vocational hours. The worker is a supporter in most desirable ways of the social order. The idler is a consumer of the social good and a menace, if not a grievous burden, to the social order. In viewing these movements the thoughtful mind will pause long and consider well.

It may be that these activities will speedily bring to pass such cordial understanding of the newer functions of the school as to contribute in no small way to the solution of the mightiest problem of man—the problem of imparting to his followers in the procession of men all that has been bound up and labeled as race culture and knowledge; and at the same time so interrelating this individual to his entire environment and to his inevitable destiny as to make him a worker for his country, a lover of his kind, a reverent believer in his God.

ROUND TABLE OF SUPERINTENDENTS OF SMALLER CITIES

THE SCIENTIFIC STUDY OF ARITHMETIC WORK IN SCHOOL

J. T. GILES, SUPERINTENDENT OF SCHOOLS, MARION, IND.

The subject of arithmetic work in school has for many years been a battle-ground of opinions. Both the content and the current methods of teaching have been assailed and defended by layman and professional alike. Traditional and authoritative methods and courses of study have been supported by the stand-patters, while faddists and progressives have sought to modify the old or to replace it with new methods and revised curricula. "What shall be taught in arithmetic?" and "How?" are the questions over which the opposing forces have contended. Recently, however, another question has presented

itself and has somewhat superseded the others in importance. This question is, "How well are we doing what we profess to do in our printed courses of study?" It is in the solution of these problems that we are now invoking the aid of scientific study as opposed to the rule of authority and opinion.

The final answer to the first of these questions, that of the content of the curriculum, must be sought in the light of the social demand on the school. Society, in whose interest the school is established, is concerned only with the product and not with the processes of education. In arithmetic this demand is mainly a fourfold one. The first thing asked of the school is that every pupil leaving it shall have a certain fund of knowledge—a store of mathematical facts at his command for use in the ordinary affairs of life. Second is desired a moderate degree of skill in the manipulation of these facts—certain habits involving speed and accuracy in a few processes regarded as essential in the life of every helpful member of the community. The third factor of this product is the ability to reason in mathematical terms—to solve the simple problems of ordinary business and professional life involving numerical relations. The fourth factor is more inclusive and more indefinite. It may be expressed as attitude or interest. It has to do with the functioning in life of the habits and tastes supposed to be inculcated by the study of arithmetic.

It is the business of the school first to ascertain the nature and extent of this fourfold social demand and then to produce it as definitely and with as little waste as possible.

As stated above, the content of school arithmetic cannot be determined by the school tself on a-priori grounds, but it must respond to the demands of other social institutions—of the home and of business in particular. This is a slow, self-regulating process, depending much on the locality and the character of the society. Efficiency, however, is wholly within the control of the school, and since the test of method rests in its efficiency, it is with the latter that we are chiefly concerned. The real problem of the school so far as arithmetic work is concerned is to produce with as little waste as possible the changes in the child mind demanded by society.

The factors in this process may also be regarded as four in number, involving (1) the pupil, (2) the teacher, (3) school administration, and (4) outside influences. Each of these is a variable made up in turn of other variable factors. Pupils may differ as to age, sex, native capacity, and previous training. Teachers vary in training and inherited qualities. Administration embraces course of study, supervision, classroom conditions, time allotment, imposed methods, textbooks, etc. The influence of the home and the playground, or the lack of one, is also unknown. Since each of these factors in the process exerts more or less influence on the final product, it is desirable to know as far as possible the effect of varying each of them that is within the control of the school.

It is here that opinion has held sway with the effect that no two schools exhibit the same combination of factors. Until we have a standardized product, however, by which we may measure the efficiency of each system, we must still remain at the mercy of opinion, tradition, and authority.

It is the work of science to create such a standard measure that any teacher or supervisor, by the observance of certain necessary conditions, may easily compare one school with any other school, or with an average attainment in many schools.

A long start has already been made in this direction. Promotion from grade to grade is usually based on the first of the product factors named above, i.e., a knowledge of arithmetical facts. The other three factors have been largely neglected by the teacher. The proposed scientific standard involves two other factors, skill and reasoning power. Attitude, interest, and social functioning cannot be scientifically measured.

The pioneer investigation in this field was made by Rice. His test included the scoring of papers from about six thousand children from seventeen schools of seven cities. From this investigation, he attempted to evaluate twelve possible factors as to their influence in producing arithmetical abilities. Altho his methods have since been improved

upon and altho some of his conclusions were not warranted by the facts presented, Dr. Rice deserves great credit for devising and carrying out with much labor and expense this now famous investigation.

In 1908 Stone tested twenty-six school systems in the 6A grade. He attempted to measure (1) the abilities of the children of this grade by two sets of exercises, one involving the fundamental operations, the other composed of reasoning problems, (2) the time cost, and (3) the comparative excellence of the courses of study used in producing these abilities.

Since this test applies only to pupils of the upper half of the sixth grade, it is of limited usefulness. Its value to teachers lies largely in the refinements of method in giving the test and the precautions against erroneous conclusions in the interpretation of results.

Courtis has more recently devised a series of tests to measure abilities in fundamental operations and reasoning thruout the school from the third grade up. The conditions under which these tests are given insure a very accurate result, when the directions are carefully followed. The objections to this test are (1) that it is too expensive to be used often and (2) that it requires considerable expert knowledge for the manipulation and interpretation of results.

As a further modification of the three tests just mentioned, using what has seemed most valuable in their methods, I desire to propose briefly a formula by which any teacher may at any time measure, within reasonable limits, the ability of any school or pupil in the fundamentals of arithmetic and in reasoning power with abstract numbers. The co-operation of a number of superintendents would be necessary to make such a formula valuable for comparison of different schools of the same grade. The object of the formula is to determine the average rate per minute of attempts and the average percentage of accuracy, together with a measure of the variation in the various fundamental operations and in reasoning.

The conditions under which the proposed tests are to be given are as follows:

1. Time for each test, from four to eight minutes.
2. The tests are to be previously written on the blackboard, plainly, in a good light, and covered by a screen or curtain until the tests begin.
3. The tests are to be arranged in rows and columns, each row containing ten problems and a sufficient number of rows given to supply more problems than can be worked by any pupil in the time allowed.
4. Pupils write on papers previously prepared in cross-sections ten wide to correspond with the arrangement of problems on the board.
5. All pupils to begin writing, giving answers only, as soon as the curtain is drawn and continue until curtain falls.
6. The numbers composing the test to be drawn by the teacher by lot in the following manner: Fifty strips of paper are prepared of uniform size, on each of which is written at regular intervals the natural series of digits omitting 0 and 1. These strips are then cut into pieces of uniform size, each piece containing a digit of the series 2–9. These digits are then placed in a bag and drawn out one by one, as needed in formulating the test. This arrangement insures an equal number of each of the digits to draw from. Zero and 1 are omitted to avoid the possibility of chance combinations of exceptional ease of solution. Tests four minutes long and over, formed in this way, would vary but slightly in the degree of difficulty.
7. Where a chance drawing would result in an absurdity, as in the subtraction of a larger from a smaller number, the order of the last two digits drawn should be reversed.
8. The operation to be tested in each exercise is to be explained to the class by the teacher before drawing the curtain. It should also be written above the test as well as indicated by placing the digits in the positions usually adopted for performing the various operations, i.e., one above the other, with a line below in addition, subtraction, and multiplication and the usual arrangement for short division, omitting all the operation signs $+$, $-$, $\times$, $\div$.
9. Pupils may grade and mark their own papers, which should be checked later by the teacher. From these marks the average or median accomplishment of the school can be quickly obtained and a measure of the variation easily derived.

The subject-matter of the proposed tests is as follows:

(1) Addition in single combinations, also double column with two figures in column.
(2) The same arrangement for subtraction.
(3) Multiplication in which both factors are single digits, also when the multiplicand is composed of two digits.
(4) Short division in which the divisor is a single digit and the dividend two, also with three digits in the dividend.

The reasoning tests include (1) three-quantity one-step abstract problems and (2) four-quantity two-step problems.

The formulae may be expressed by letters which are to be replaced with the digits drawn from the bag. Two letters written together mean a number of two digits, not multiplication as in algebra.

For addition we have:

Find the sum:

$$\begin{array}{cccc} a & c & e & g \\ \underline{b} & \underline{d} & \underline{f} & \underline{h} \end{array}, \text{ etc.}$$

Also,

$$\begin{array}{ccc} ab & ef & ij \\ \underline{cd} & \underline{gk} & \underline{kl} \end{array}, \text{ etc.}$$

For subtraction:

Find the difference:

$$\begin{array}{ccccc} a & c & e & g & i \\ \underline{b} & \underline{d} & \underline{f} & \underline{h} & \underline{j} \end{array}, \text{ etc.}$$

$$\begin{array}{ccc} ab & ef & ij \\ \underline{cd} & \underline{gh} & \underline{kl} \end{array}, \text{ etc.}$$

Multiplication:

Write products:

$$\begin{array}{cccc} a & c & e & g \\ \underline{b} & \underline{d} & \underline{f} & \underline{h} \end{array}, \text{ etc.}$$

$$\begin{array}{ccc} ab & de & gh \\ \underline{c} & \underline{f} & \underline{i} \end{array}, \text{ etc.}$$

Division:

$$\begin{array}{ccc} a)bc & d)ef & g)hi \\ a)\overline{bcd} & e)\overline{fgh} & i)\overline{jkl} \end{array} \quad \begin{array}{l} \text{, etc.} \\ \text{, etc.} \end{array}$$

One-step reasoning formulae:

$$a+b=c \qquad a\times b=c \qquad a\div b=c$$

from which are derived the following problems:

Indicate by the abbreviation add, sub., mul., or div. the operation to be performed in the two given numbers to get the required one.

(1) The sum of two numbers is a, one is b, what is the other?
(2) The difference of two numbers is a, one is b, what is the other?
(3) The product of two numbers is a, one is b, what is the other?
(4) The quotient of two numbers is a, one is b, what is the other?
(5) What number added to b gives c?
(6) What number subtracted from b gives c?
(7) What number multiplied by b gives c?
(8) What number divided by b gives c?
(9) a added to what number gives c?
(10) a subtracted from what number gives c?
(11) a multiplied by what number gives c?
(12) a divided by what number gives c?
(13) a is b more than what number?
(14) a is b less than what number?

(15) a is b times what number?
(16) a is b divided by what number?

The problems in the two-step reasoning test are derived from the formulae:

$$a+b=c+d$$
$$ab=cd$$
$$(a+b)=cd$$

(1) What number added to a is equal to the sum of c and d?
(2) What number subtracted from a is equal to the sum of c and d?
(3) What number added to a is equal to the difference of c and d?
(4) What number subtracted from a is equal to the difference of c and d?
(5) What number multiplied by a is equal to the product of c and d?
(6) What number multiplied by a is equal to the sum of c and d?
(7) What number multiplied by a is equal to the difference of c and d?
(8) What number added to a is equal to the product of c and d?
(9) What number subtracted from a is equal to the product of c and d?
(10) What number multiplied by the sum of a and b equals c?
(11) What number multiplied by the difference of a and b equals c?
(12) What number divided into the sum of a and b equals c?
(13) What number divided into the difference of a and b equals c?

The order in which the reasoning problems are given is also to be determined by lot, two or more sets being used if necessary to provide sufficient problems for the time allowed.

Problems formed from these formulae by chance drawing and given to classes under the uniform conditions named above are open to the criticism that the results obtained from them are only approximate. It is the belief of the author of this paper that they would be sufficiently accurate for the purpose in hand and that they would have the tremendous advantage of easy availability and of universal application. The schools as well as other business institutions must submit to the test for efficiency.

In the hope that such formulae as these proposed will enable us to determine in larger degree what is useful and what is waste in the process of teaching arithmetic, they are here offered for your consideration and for your criticism. Opinions no longer carry authority. Scientific methods of study alone command respect and the time for exact experimental investigation of our educational problems is at hand.

UTILIZATION OF THE SCHOOL PLANT

WILLIAM A. WIRT, SUPERINTENDENT OF SCHOOLS, GARY, IND.

The school idea which I present is not unique and it is not revolutionary. We are trying to put into practice only those things urged for a generation by our recognized educational leaders. In fact, we are extremely conservative and do not wish to take any chances with undigested educational philosophy. The idea that we need an enlarged school to meet the educational needs of the twentieth century is not new. We are agreed that the twentieth-century school must educate for citizenship and character, must develop individuality and efficiency, must develop the power of reflective thinking, form habits of application, and somehow get the child to find pleasure and joy in constructive effort. We are also agreed, I think, that such an education is possible only by giving the child the freedom of self-activity. We are also agreed that the civic care of the child in the twentieth century must include satisfactory public facilities for amusement, play, and work, as well as study.

Personally, I am certain of one thing. We have not realized in Gary the ideal school of the twentieth century. But we are indeed glad to be in a position where we can help in the solution of this problem.

Limited financial resources and a tremendous annual increase in the school population have forced us to attempt an enlarged school activity and at the same time consider the taxpayer. We do not wish to increase our school expenditures, but we do try to get more for our money.

The twentieth-century public school saves the taxpayers money by providing, first, classrooms and libraries where the child can study books and recite from books; second, playgrounds, gymnasiums, and swimming-pools where the child can play and secure a general physical training; third, shops, gardens, drawing-rooms, and laboratories where the child can work and learn to do efficiently many things by doing them; fourth, an auditorium where by lectures, recitals, dramatization, phonograph, player-piano, stereopticon lantern, and motion pictures the visual and auditory education of the child may be done efficiently. Four separate and distinct places are provided for each child, but the total per-capita cost is not increased fourfold. The per-capita cost for classroom study under good conditions is from $100 to $200, for play and physical training from $10 to $25, for work from $20 to $125, for an auditorium from $10 to $25. The total per-capita cost for the four departments is from $140 to $400, or from 40 per cent to 100 per cent greater than the per-capita cost for the study and recitation room alone.

But each child can be in only one of the four places at the same time. The new school so arranges the classes that different sets of children are in the four separate departments all of the time. By this plan the new school accommodates four times as many children, and at a per-capita cost of $35 to $100. By providing facilities for the child's play, work, and recreation as well as facilities for study the per-capita cost of the school plant is only 35 per cent to 50 per cent that of the traditional study classroom school. There is a corresponding saving in annual maintenance cost. Extra teachers and special supervisors are also eliminated, and the per-capita cost for instruction is less than in the exclusive study school.

A much more important feature of the new school is that the children want to go to such a school every day in the year and eight to ten hours each day. The universal problem of keeping the children in school has been solved. The school provides a real life so that the child wants to educate himself at the very moment that he has the opportunity. The play impulse is transformed into a work impulse so that real pleasure is experienced in work. The school life creates a need and desire for the academic and cultural work of the school. There is no attempt to remove the difficulties. The supposed distasteful work of the school is not sugar coated with sentimentalism. The wasted time and the misdirected energy of the street and alley are utilized to awaken ambition, develop initiative, and create power in the child, so that he can find real joy in the mastery of difficulties. The child is busily and actively engaged the year round educating himself.

The worst possible form of an educational plant is a massive brick and stone building with every device perfected for keeping children quiet in a straight-jacket school seat all day long. Children are annihilated in such a school, not educated. The traditional classroom study-school building may answer very well for the mechanical study of textbooks. But real education demands much more than the formal study of textbooks. The new school gives the child one-fourth of his time for the formal study of textbooks and for the formal organization of what he has learned during the remaining three-fourths of his time in real activities. The addition of facilities for real activities in a combined workshop, playground, and school makes real, genuine education possible. The new school does not dispense with books or culture. It provides for a more efficient use of books and a more genuine and thoro acquisition of culture.

When the child is interested in the work and activities of the school, when the child has developed the power of application and concentration, when the child is in a condition where he is capable and anxious to put forth tremendous effort to master the difficulties

of the school, then it is easy and natural for the time and energy of both teacher and pupil to be used efficiently.

Eliminate the plan of teachers trying to teach things that they do not know by means of special supervisors. Permit teachers to teach only the things that they do know and know how to teach. Arrange the size of the classes so that with classes numbering four students or four hundred they are the best possible groups for the work in hand.

Break up the rigid grouping of children in fixed classes. Any child should secure as much time as he needs in any subject or department. If the child is weak physically and cannot undertake for the present formal textbook work, he should use the other facilities of the school as a sanitarium for the recovery of his physical strength. If the child is deficient in percentage because of lack of preparation in common fractions and decimals, he should not be flunked and kept repeating work in percentage. He should go on with his work in the class in percentage and in place of some of the recreation features of the school take extra work in a class several grades below where he can get directly the needed drill in common fractions and decimals. The same principle can be applied in all subjects and for pupils who wish to advance more rapidly as well as for those who wish to make up deficiencies. The retarded, subnormal, and abnormal child can be accommodated without extra teachers or facilities.

Use the great outdoors. Use classrooms, laboratories, shops, auditoriums, gardens, playgrounds, gymnasiums, textbooks, library books, real objects, real activities and occupations; but use each only for that educational purpose for which it is best adapted.

Every part of the school plant can be made an educational opportunity. There is no reason why the school furniture and much of the equipment cannot be made in school cabinet shops under the direction of a cabinet-maker selected for his teaching ability as well as his mechanical skill. There is no reason why the school painting, stage scenery, plumbing, electrical work, carpentry, printing and bookbinding, forging, foundry and machine work cannot be done in the same way. There is no reason why the school engineer should not be selected because of his teaching ability as well as his mechanical skill. The boys can work with this engineer as apprentices during certain hours in the day and learn to fire boilers, operate pumps, engines, generators, motors, heating and ventilating machinery. There is no reason why some of the nature-study teachers should not be selected because of their practical knowledge and skill as well as for their college degrees. A practical landscape gardener can take complete charge of the school garden, lawns, shrubbery, and trees, and the children will be delighted to assist him. Even the stairways and school corridors provide the highest possible educational opportunity, if we will but use them.

The twentieth-century school does the work of the public library and public playground much more efficiently and much more economically.

The school employs specially trained teachers to direct the outside reading of children and cultivate an appreciation for good literature. These teachers meet every child for a thirty-minute period on alternate days. By means of stories and reading from sets of books furnished by the public library, the children are interested in the best literature. This literature teacher's classroom is in reality a library of literature for children, and the teacher is in the truest sense a children's librarian. Many of the books furnished by the public library are supplied in sets of thirty or forty volumes of the same book so that classwork is possible in this directed reading.

Similarly the nature-study teachers have a nature-study library in their laboratory, the music teachers have a music library, the drawing teachers have an art library, etc. The library work is supplemented by pictures, victrolas, piano-players, stereopticon and motion-picture machines in the school auditorium; and by the museum specimens in school corridors. Every child is reached regularly in an organized way. The library maintenance and salary cost per book circulated and read is about one-fourth of one cent, only 5 per cent of said cost in public libraries. The life of a book circulated in sets under

the direct control of the special teachers is ten times that of the usual library circulating book.

In Gary it is hoped to have a branch of the public library in every school, with an assistant librarian from the public library in charge, and with the special teachers in the school co-operating in cultivating and directing the reading of the children.

The unit school plant will accommodate about 2,700 children. The buildings are open evenings, Saturdays, and vacations. Adults use the school buildings as freely as children. The branch library is so placed that it can be entered directly from the outside and without climbing steps. The location of the branch library in the same building with the social, recreation, and study facilities brings to the library many readers who would not otherwise form the library habit. In turn the library helps to promote the other social, recreation, and study features of the school.

The opinion is becoming fixed that we have not utilized the school plants completely unless they are used for recreation and social centers by adults. Fortunately a school plant that provides for the constructive play and recreation activities of children is also most admirably adapted for similar activities with adults. The playgrounds, gymnasiums, swimming-pools, auditorium, club and social rooms, library, shops, laboratories, etc., make a complete social and recreation center for adults. Experience has demonstrated that the facilities for academic instruction add to the attractiveness of the plant as a social and recreation center.

Compared with the cost of such facilities and their use when separated from the school plant, the economy in favor of the combined playground, workshop, and school is indeed surprising. The city of Chicago has a most elaborate system of recreation parks and field houses. Selecting the eleven most successful parks of the South Park Commission, we may compare the total cost and use of the eleven parks with the cost and use of one Gary school plant. Note that the attendance of the parks is the total, not the average for the eleven parks. Also note that the cost of the school includes the furnishing of complete school facilities for 2,700 children, in addition to the social and recreation features.

	Total for Eleven Parks	One School
Population	800,000	20,000
First cost, less land	$2,000,000	$300,000
Annual maintenance	$440,000	$100,000
Annual attendance—		
Indoor gymnasium	310,000	1,000,000
Shower baths	1,385,000	500,000
Outdoor gymnasium	2,000,000	2,000,000
Swimming-pool	725,000	300,000
Assembly halls	270,000	1,000,000
Clubrooms	70,000	50,000
Reading-rooms	600,000	1,000,000
Lunch-rooms	520,000	20,000

The twentieth-century school is planned to secure the highest possible efficiency from buildings, grounds, and equipment, and the time and energy of teachers and pupils. It gives the child not a shop, not a playground, but a life.

DISCUSSION

Harlan Updegraff, Bureau of Education, Washington, D.C.—Educational administration in many of our cities has these three characteristics: (1) the scope of the public schools is gradually extending; (2) increased expenses have accompanied this expansion; (3) the tax rates and the bonded indebtedness are approaching their legal maximum.

Under such conditions any system of school organization that gives increased school facilities without increasing the tax rate is bound to receive careful consideration. The public schools of Gary, Ind., seem to meet this condition. By the utilization of all parts of its buildings and by lengthening the school day to six and six and one-half hours, two sets of pupils are accommodated in the same school plant in which under the ordinary system but one set of pupils could be housed. At the same time the course of study has been extended to cover manual training, domestic science, and laboratory work in the sciences. The entire subject-matter of the course of study has been considerably enriched. More important than this, thru the use of the school building and the playground as a social center, the leisure time of the pupils is spent upon the school premises in wholesome work and play. In this latter phase of the work gymnasiums and swimming-pools, which, together with the playgrounds, are placed under skilled directors, have been exceedingly helpful. Another important feature is the use of the school building before and after hours of the day school for evening schools, for Saturday classes, and for vacation schools. Practically all parts of the building are in use most of the time.

The success with which the plan has met in Gary is sufficient to warrant its trial in other cities where conditions are favorable. It should be observed, however, that it is necessary, in the first place, that the hours of the school day be lengthened, and, secondly, that the buildings now in use be so constructed that the basement, hall, and attic space may be transformed into workshops, laboratories, and gymnasiums.

James G. Riggs, State Normal School, Oswego, N.Y.—Less than a half-century ago the schoolhouse at the cross-roads or in the small village in a farming section answered many more purposes than our present buildings. Besides the six or seven months' school there was the winter singing-school, the occasional writing-school, the spelling-bee with its excitement, possibly a debate with neighboring champions, a temperance lecture, a play on a rural subject in native setting, preaching on alternate Sundays, rarely a funeral but always a meeting-place for young and old, and always a chance for the beginnings of courting and mating for all the countryside. The building paid for by public tax was used for community purposes. It was the educational and social center for the locality. The result was a general acquaintance thruout the whole region among a homogeneous people, together with an exchange of friendship, of views, of goods, and of intellectual stimulus The social results were large. No bad feeling could long endure among people who met so often in so many interests. They were interdependent and self-respecting.

From scenes like these thruout the eastern and middle states went young men with their wives to the westward to help develop this great land and show the East how to do things, as at Gary. Communities are few now which hold the same traditions, religion, and ideals. Various foreign types, tongues, and ways have come in almost in a night, and no provision has been made for them aside from the common school. Even the churches have not gone forward to greet them, to make them feel at home in a new land. Of all people we need to preserve the original democratic social ideals of the communities described and to provide for the interests of those who have so many common needs as strangers—chief among them the need of understanding one another and the ideals inherent in their adopted country.

There can be no return to the spontaneous gatherings at the cross-roads. The telephone, the rural delivery, and the automobile have put an end to those conditions, but have not filled the place of those face-to-face meetings of one friend with another. Nor will our cosmopolitan population take the lead themselves in setting a common meeting-place for common purposes.

It is therefore the duty of the authorities to take the natural means at hand and make them available for community purposes. Some cities and larger towns have already seen their opportunity and have established the school as a center for various activities

which appeal to the newcomer, as the following: school grounds fitted for sports for all, evening instruction in sewing, dressmaking, cooking, English in its spoken and written forms, manual training, music, folk-dancing and ordinary dancing, and gymnasium work. Rooms are provided for a library, quiet games, song recitals and lectures, clubs, moving pictures, and, in some cases, bathing facilities. No better service can be given than to spend a series of evenings during the winter on such a program as this:

The Mayor of the city on "My Office and Its Duties."
The City Chamberlain on "City Funds, How Obtained and How Disbursed."
The City Assessor on "How Values Are Set, with Examples."
The Superintendent of Public Works on "Public Property and Its Care."
The City Judge on "Our City Court and Its Work."
The Police and the Fire Departments.
The Child in the City, and His Education.

Such a program or a modification of it is good not only for the adults who are new to our land, but for natives and for the officials themselves who are in office. It is the best kind of a report to the people, and may well be likened to the initiative and the referendum. The program should be directed by public officials and provided for in the regular budget where expense is incurred. The programs find their justification in the fact that they are educational; even the games and sports, inasmuch as they are orderly and directed. They are the only foil to the saloon and the dance hall with their unwholesome surroundings. They furnish a meeting-place and recreation for those whose rooms or houses are not homes in the proper sense, and they afford an extension of the function of the school to those adults who otherwise would be shut out of many advantages of this new world. Here they may talk over community interests, local improvements, needed reforms, and thus become responsible citizens. When they meet regularly they are likely to think alike and when occasion arises they are likely to act alike and for the common good. Under cordial and sympathetic treatment from native stock the foreigner becomes happily adjusted to the new conditions, and his children may easily become masters in the next generation. Democracy has its best training here among those of foreign birth, and they are wise officials who see the opportunity and embrace it. Ideals are being formed and futures shaped under such conditions where the more favored are, in Browning's phrase, willing "to lend themselves out."

The school authorities should be the active parties in initiating and controlling such use of the school plant, as here dangers may creep in. Matters controversial in politics, religion, or social conditions must be avoided. The object is to harmonize and unify interests, not to set passions astir nor engender strife. Whatever has not the approval of the whole community will be short lived and will react. On the other hand, whatever benefit and uplift come from the use of the school building will so justify the expense that once begun the custom will be permanent.

Such a plan will react on the scholastic work of the school by putting a new and real interest into the work of the day. The building should be so planned, seated, and equipped that it will serve not only the purposes of the five-hour school, but of all the evening activities. Instead of all education centering about the child, his parents are included too, and the authorities will find the added element making the solution of the problem easier because they are helping to solve it.

In a word, the increased use of the school plant for community activities is the recognition of a human need and the effort to supply that need.

THE NATIONAL COUNCIL OF EDUCATION

CONSTITUTION*

PREAMBLE

The National Council of Education shall have for its object the consideration and discussion of educational questions of general interest and public importance, and the presentation, thru printed reports, of the substance of the discussions and the conclusions formulated. It shall be its object to reach and disseminate correct thinking on educational questions; and, for this purpose, it shall be the aim of the Council, in conducting its discussions, to define and state with accuracy the different views and theories on the subject under consideration, and, secondly, to discover and represent fairly the grounds and reasons for each theory or view, so far as to show, as completely as possible, the genesis of opinion on the subject. It shall be the duty of the Council, in pursuance of this object, to encourage from all its members the most careful statement of differences in opinion, together with the completest statement of grounds for the same. It shall further require the careful preservation and presentation of the individual differences of opinion, whenever grounds have been furnished for the same by members of the Council. It shall invite the freest discussion and embody the new suggestions developed by such discussions. Any member making such suggestion or objection may put in writing his view, and the grounds therefor, and furnish the same to the secretary for the records of the Council. It shall prepare, thru its president, an annual report to the National Education Association, setting forth the questions considered by the Council during the previous year, and placing before the Association, in succinct form, the work accomplished. It shall embody in this report a survey of those educational topics which seem to call for any action on the part of the Association. The Council shall appoint, out of its own number, committees representing the several departments of education, and thereby facilitate the exchange of opinion among its members on such special topics as demanded the attention of the profession or of the public.

ARTICLE I—MEMBERSHIP

1. The National Council of Education shall consist of one hundred and twenty members, selected from the membership of the National Education Association. Sixty of the members shall be elected by the National Council of Education, and sixty by the Board of Directors of the National Education Association.

Each body shall select ten members annually, who shall serve for six years.

2. The Council shall elect its quota of members at its regular annual meeting.

The Board of Directors of the National Education Association shall elect its quota of members at the second meeting held during the annual meeting of the National Education Association.

3. The absence of a member from two consecutive annual meetings of the Council shall be considered equivalent to resignation of membership. All persons who have belonged to the Council shall, on the expiration of their membership from any cause whatever, except expulsion, become honorary members, with the privilege of attending its regular sessions and participating in its discussions. No state shall be represented in the Council by more than twelve members.

* As amended at San Francisco session, July 12, 1911.

ARTICLE II—QUALIFICATION FOR MEMBERSHIP

All members of the Council shall be either life or active members of the National Education Association.

ARTICLE III—MEETINGS

There shall be a regular annual meeting of the Council held in connection with the Department of Superintendence of the National Education Association, or at such other time and place as the Executive Committee of the Council may designate. There may be special meetings of the Council, subject to the call of the Executive Committee, but the attendance at these meetings shall be entirely voluntary. A majority of the Council shall constitute a quorum for the transaction of business at any meeting, whether regular or called; but any less number, exceeding eight members, may constitute a quorum for the transaction of business at the regular annual meeting, as defined in this article.

ARTICLE IV—THE WORK OF THE COUNCIL

The Council shall, from time to time, undertake to initiate, conduct, and guide the thoro investigation of important educational questions originating in the Council; also to conduct like investigations originating in the National Education Association, or any of its departments, and requiring the expenditure of funds.

ARTICLE V—THE APPOINTMENT OF SPECIAL COMMITTEES AND EXPERTS

In the appointment of special committees, and in the selection of writers and speakers, it shall be the privilege of the Council to appoint such experts, whether members of the Council or not, as are deemed best qualified to conduct investigations.

ARTICLE VI—OFFICERS

The officers of the Council shall be a president, vice-president, and secretary, each of whom shall serve for three years, with terms so arranged that one officer is elected annually.

It shall be the duty of the president of the Council to prepare, with the assistance and approval of the Executive Committee, such a program for the annual meeting as shall realize as fully as practicable the purposes for which the Council was organized and exists.

ARTICLE VII—STANDING COMMITTEES

1. There shall be four standing committees: an Executive Committee, a Committee on Membership, a Committee on Educational Progress, and a Committee on Investigations and Appropriations.

2. The Executive Committee shall be composed of the president of the Council and three other members, whose terms of office shall be so arranged that one new member may be chosen each year.

3. It shall be the duty of the Executive Committee to provide an annual program by selecting, whenever feasible, subjects for investigation, and appointing committees to conduct such investigations. It shall be the duty of the Executive Committee to carry out the provisions contained in this constitution referring to volunteer and invited papers. It shall be the duty of the Executive Committee to provide a place on the program for the report of any investigation which may be ordered by the National Education Association or its departments.

4. The Committee on Membership shall be composed of the president of the Council and six other members, whose terms of office shall be so arranged that two vacancies may be filled every year.

5. There shall be appointed annually a committee of one to submit at the next meeting a report on "Educational Progress during the Past Year," in which a survey of the

important movements and events in education during the preceding year is given. This committee need not be selected from the members of the Council.

6. The Committee on Investigations and Appropriations shall be composed of nine members, whose terms of office shall be so arranged that three vacancies may be filled each year. No proposal to appoint a committee to undertake an educational investigation of any kind, and no proposal to ask the Board of Directors of the Association for an appropriation for any purpose, shall be acted upon until such proposal has been referred to this Committee on Investigations and Appropriations for report.

ARTICLE VIII—THE DUTIES OF THE COUNCIL

1. It shall be the duty of the Council to further the objects of the National Education Association, and to use its best efforts to promote the cause of education in general.

2. The meetings of the Council shall be, for the most part, of a "round table" character.

ARTICLE IX—AMENDMENTS

This constitution may be altered or amended at a regular meeting of the Council, by a two-thirds vote of the members present, and any provisions may be waived at any regular meetings by unanimous consent.

By-laws not in violation of the constitution may be adopted by a two-thirds vote of the Council.

OFFICERS, STANDING COMMITTEES, MEMBERS

OFFICERS FOR 1912–13

CHARLES H. KEYES	Saratoga Springs, N.Y.	*President*	Term expires in 1913
JAMES Y. JOYNER	Raleigh, N.C.	*Vice-President*	Term expires in 1915
ROBERT J. ALEY	Orono, Me	*Secretary*	Term expires in 1914

EXECUTIVE COMMITTEE

THE PRESIDENT, *ex officio, chairman*

JOSEPH SWAIN	Swarthmore, Pa	Term expires in 1913
JAMES M. GREENWOOD	Kansas City, Mo	Term expires in 1914
ELLEN C. SABIN	Milwaukee, Wis	Term expires in 1915

COMMITTEE ON MEMBERSHIP

THE PRESIDENT, *ex officio*

A. C. NELSON	Salt Lake City, Utah	Term expires in 1913
ROBERT J. ALEY	Orono, Me	Term expires in 1913
JAMES Y. JOYNER	Raleigh, N.C	Term expires in 1914
JAMES M. GREENWOOD, *chairman*	Kansas City, Mo	Term expires in 1914
AUGUSTUS S. DOWNING	Albany, N.Y	Term expires in 1915
CARROLL G. PEARSE	Milwaukee, Wis	Term expires in 1915

COMMITTEE ON INVESTIGATIONS AND APPROPRIATIONS

AUGUSTUS S. DOWNING	Albany, N.Y	Term expires in 1913
LORENZO D. HARVEY	Menomonie, Wis	Term expires in 1913
JOHN H. PHILLIPS	Birmingham, Ala	Term expires in 1913
EDWARD T. FAIRCHILD	Durham, N.H	Term expires in 1914
ELLA FLAGG YOUNG	Chicago, Ill	Term expires in 1914
Z. X. SNYDER	Greeley, Colo	Term expires in 1914
JAMES M. GREENWOOD, *chairman*	Kansas City, Mo	Term expires in 1915
FRANK A. FITZPATRICK	Boston, Mass	Term expires in 1915
PAYSON SMITH	Augusta, Me	Term expires in 1915

MEMBERS

Elected by the Association *Elected by the Council*

Secretary—Robert J. Aley, president of the University of Maine.....Orono, Me.

FIRST SESSION—Monday Forenoon, February 26, 1912

Charles H. Keyes, president of Skidmore School of Arts, Saratoga Springs, N.Y., called the meeting to order at 9:40 A.M. in the Banquet Hall of the Southern Hotel, St. Louis, Mo.

This session of the Council was devoted to a conference and discussion on "Economy of Time in Education."

The presentation on behalf of the Committee of the Council was made by James H. Baker, president of the University of Colorado, Boulder, Colo., and James H. Van Sickle, superintendent of schools, Springfield, Mass.

No presentation on behalf of the Committee of the National Association of State Universities was made because of the unavoidable absence from the session of Albert Ross Hill, president of the University of Missouri, Columbia, Mo., and Frank Strong, chancellor of the University of Kansas, Lawrence, Kans., who had been selected to make the report.

The presentation on behalf of the Committee of the Department of Superintendence was made by Harry B. Wilson, superintendent of schools, Decatur, Ill., Frank E. Thompson, professor of education, University of Colorado, Boulder, Colo., and John H. Francis, superintendent of schools, Los Angeles, Cal.

The general discussion was participated in by the following: Joseph Swain, president of Swarthmore College, Swarthmore, Pa.; Robert J. Aley, president of the University of Maine, Orono, Me.; E. Mackey, superintendent of city schools, Trenton, N.J.; J. M. Green, president of the State Normal School, Trenton, N.J.; Francis G. Blair, state superintendent of public instruction, Springfield, Ill.; John W. Cook, president of the State Normal School, De Kalb, Ill.; and L. D. Harvey, president of Stout Institute, Menomonie, Wis.

President Baker, of Boulder, Colo., closed the discussion.

The meeting then adjourned.

SECOND SESSION—MONDAY AFTERNOON, FEBRUARY 26, 1912

The session was called to order at 2:00 P.M.

The topic under discussion was "The Preliminary Report of the Committee on Special High-School Preparation of Candidates for Normal Training-School."

David Felmley, president of the State Normal University, Normal, Ill., made a general statement of the case.

The situation from the viewpoint of superintendents of schools was given by John H. Phillips, superintendent of schools, Birmingham, Ala., and Jacob A. Shawan, superintendent of schools, Columbus, Ohio.

John R. Kirk, president of the State Normal School, Kirksville, Mo., and Homer H. Seerley, president of Iowa State Teachers College, Cedar Falls, Ia., gave the normal-school executive viewpoint.

The view of the high-school principals was presented by J. Stanley Brown, principal of Township High School, Joliet, Ill.

The following people took part in the discussion: Charles H. Chapin, principal of the State Normal School, Montclair, N.J.; D. B. Parkinson, president of the State Normal School, Carbondale, Ill.; and John W. Carr, superintendent of schools, Bayonne, N.J. A brief summary of the case was made by President Felmley.

THIRD SESSION—MONDAY EVENING, FEBRUARY 26, 1912

The meeting was called to order at 8:40 P.M.

At this session, "The Preliminary Report of the Committee on Health Problems in Education" was the subject of discussion.

The scope of the committee's work was presented by the chairman of the committee, Thomas D. Wood, M.D., under the title "Health Problems in Education."

United States commissioner of education, Philander P. Claxton, Washington, D.C., read a paper on "The Need for the Health Ideal in Public Education."

"The School's Responsibility for Providing Healthful Environment and Program" was presented by R. W. Corwin, M.D., Pueblo, Colo.

John F. Keating, superintendent of schools, Pueblo, Colo., and Albert E. Winship, editor, *New England Journal of Education*, Boston, Mass., spoke in the general discussion.

The meeting then adjourned.

FOURTH SESSION—Wednesday Forenoon, February 28, 1912

The meeting was called to order at 9:50 A.M. in the Banquet Hall of the Planters Hotel.

The time of the session was devoted to "The Preliminary Report of the Committee on Rural School Education."

James Y. Joyner, state superintendent of public instruction, Raleigh, N.C., stated that the committee had arranged for E. T. Fairchild, state superintendent of public instruction, Topeka, Kans., to present the general problem. In accordance with this plan, Superintendent Fairchild spoke at length upon this topic.

The general discussion was participated in by Adelaide Steele Baylor, State Deparrment of Education, Indianapolis, Ind.; David Snedden, commissioner of education for Massachusetts, Boston, Mass.; E. C. Elliott, professor of education, University of Wisconsin, Madison, Wis.; E. E. Balcomb, Department of Agricultural Education, State Normal and Industrial College, Greensboro, N.C.; John R. Kirk, president, State Normal School, Kirksville, Mo.; and D. T. Davis, of Decatur, Ill.

The following resolution was introduced and approved:

Resolved, That the National Council of Education recommend to the Committee on Investigations and Appropriations the setting apart of $250 to meet the necessary expenses of the committee from the Department of Superintendence on "Economy of Time in Elementary and Secondary Education."

The meeting then adjourned.

FIFTH SESSION—Thursday Forenoon, February 29, 1912

The Council met in joint session with the Department of Superintendence in the Banquet Hall, Southern Hotel, St. Louis, Mo.

The meeting was called to order by President Keyes at 9:44 A.M.

Payson Smith, state superintendent of public schools, Augusta, Me., presented "The Report of the Committee on Uniform Records and Reports," which is printed as a separate pamphlet.

A special discussion of this report was engaged in by Harlan Updegraff, chief of the Division of School Administration, Bureau of Education, Washington, D.C.; E. C. Warriner, superintendent of schools, Saginaw, Mich.; and W. H. Elson, superintendent of schools, Cleveland, Ohio.

Walter E. Ranger, state commissioner of public schools, Providence, R.I., spoke in the general discussion.

Upon motion of Payson Smith, the report was adopted and the committee discharged.

Dr. Robert Brooks, of Cincinnati, Ohio, who has been chosen as expert by the Committee on Salaries, Tenure, and Pensions of Teachers, was introduced and made a general statement concerning the plans inaugurated by the committee to secure statistics. He requested the co-operation of all superintendents and school officials in securing the material needed by the committee.

The last topic of the session was "By What Standards or Tests Shall the Efficiency of a School or System of Schools Be Measured?" George D. Strayer, professor of educational administration, Columbia University, New York, N.Y., chairman of the committee to investigate this topic, presented the scope and plan of the proposed work.

The rural school phases of the problem were presented by E. C. Elliott, professo of education, University of Wisconsin, Madison, Wis.

The general discussion was opened by Carroll G. Pearse, superintendent of schools, Milwaukee, Wis. He was followed by Charles H. Judd, director of the School of Education, University of Chicago, Chicago, Ill.; Z. X. Snyder, president, Colorado State Teachers College, Greeley, Colo.; and Lotus D. Coffman, State Normal School, Charleston, Ill. President Snyder's paper was read by C. A. Hollingshead, of Gunnison, Colo.

By a unanimous vote of the Council, a recommendation was made to the Committee on Appropriations and Investigations that the Council committee appointed to investigate standards and tests by which schools or school systems may be measured be given an appropriation of $500 to defray necessary expenses incurred.

The Council also recommended to the Committee on Appropriations and Investigations that the request of the Committee on Health Needs of School Children to have an appropriation of $1,600 be favorably considered.

The Council adjourned at 12:10.

ROBERT J. ALEY, *Secretary*

PAPERS AND DISCUSSIONS

TOPIC: ECONOMY OF TIME IN EDUCATION

A

JAMES H. BAKER, PRESIDENT OF THE UNIVERSITY OF COLORADO, BOULDER, COLO.

[*Introductory*]

Mr. President and Members of the Council:

At the request of the president an informal discussion of "Economy of Time in Education" has been arranged for this meeting. There are now three committees at work on this problem: the Council committee and two co-operating committees, that of the National Association of State Universities, and that of the National Department of Superintendence. The Council committee is not ready for a final report, and, altho the delay is already long, I believe the final report should not be hastened, especially since we may now expect vigorous work from the committee of the Department of Superintendence, and, I believe, also from the committee of universities. However, it was believed that an informal conference of the three committees at this time and an open discussion would be an advantage. It was announced that my San Francisco paper on "Reorganization of American Education" should be taken as a kind of report of progress and made the basis of our discussion this morning. I need not read it or repeat its arguments, for copies have been sent to each member of the Council and it appears on p. 94 of the 1911 volume of *Proceedings*. However, it is important to remember that this is not a question of "shortening the college course"; that phrase does not give the significance of the inquiry, which is upon the length of the whole period of general education. The committee does not advocate lowering the standard of American education, or cramming and hurry, or lessening the period for those who early turn to vocations. It aims rather to strengthen scholarship, to edu-

cate without worry or waste, to keep a class of pupils in school longer than is done under present conditions. We believe that by a more economical use of material and methods two years at least can be saved in the whole period of education, including the college, and better results secured than now.

[*Final Summing Up*]

This discussion seems hopeful because on this occasion it has remained within shouting-distance of the subject. I will take time to touch only a few points of the discussion. I agree that we need to study educational aims and educational principles, but we shall be studying them a thousand years from now, and the question of economy of time is somewhat independent of educational aims, and involves principles in method and use of material that would apply in any case. The committee has proposed tentatively a time scheme, based on a rational view of the remedies suggested, in the preliminary investigation, by all classes of educators. Would it not be well for the three committees to center their further investigations upon this scheme and so work with a common understanding and purpose? The time has come to make this question concrete and seek examples and experiments. Remember that economy of time is proposed for those who go thru the whole period of education. It is not intended to shorten the period for those who turn earlier to vocations, but rather to lengthen it by giving them the tools of education at the age of twelve and then offering prevocational courses that will tend to keep them in school longer than they remain under present conditions. The principle of "prolonging infancy" used by one member in this discussion has its merits, but may be applied harmfully. In our whole period of preparatory and university education we prolong the infancy of the pupil until he is approaching his second childhood and in this we differ from every other civilized country. Elsewhere in general the student completes his preparation for the university nominally at eighteen; in this country we prolong university preparation to twenty-two or twenty-three. We must answer the claim that we are at least two years behind other countries at every stage of our education. Reference was made to an illustration of the testimony of the "old fellows" used in my paper on reorganization. This was not harking back to the past, but was used as evidence that there is such a thing as general education, a fact which some inconsequent experimenters and business men turned educational philosophers would attempt to deny. There is danger that our education today may become a thing of shreds and patches. Moreover, anyone studying such a question as is before us must look not only to the present but to the past and the future or he will have no perspective for his judgment. You know what the poets say:

> With large discourse, looking before and after,

and

> We look before and after,
> And pine for what is not.

B

JAMES H. VAN SICKLE, SUPERINTENDENT OF SCHOOLS, SPRINGFIELD, MASS.

[*Abstract*]

It is generally admitted that there is waste in education. It is not denied by a single person among more than one hundred who have been consulted in the course of this inquiry that some of this waste is chargeable to elementary education. There are those who would revolutionize the course of study from beginning to end for all pupils. There are others who would change the course materially for two groups of pupils: the highly gifted and the slow. But a majority of those consulted seem in the main to accept the course of study as it has developed, and to hope for improved conditions thru elimination of nonessentials, substitutions, better teaching, and improved administrative adjustments.

It is clearly impossible to move children thru the course in definite chronological age groups. The differences in mental power are too great for this and we do not yet know enough about psychical age to use this term in speaking of groups of pupils in the various stages of education.

One of the conspicuous causes of waste in elementary education is the attempt to give the same preparation to all, regardless of wide differences in aptitude and the character of the life to be led. Classifying the grades above the sixth as secondary would facilitate differentiation in the upper grades, thus permitting all pupils to make more direct preparation for business or the industries or professional life than is now possible.

We are assuming in this committee that it is possible and desirable to end the college and begin the university at twenty instead of twenty-two, thus saving two years during the whole period of education, and we readily admit the responsibility of the elementary school for a share of this saving, but in accepting twenty as the age at which the college course should be completed, we have in mind the abler students, not all students.

We cannot go far until we can agree upon the essentials of a course of study, and common standards of measurement, for economy of time in education must be relative to the results which we wish to secure.

In determining the essentials of a course of study and adopting measures of accomplishment, there is danger that too narrow a definition of "essentials" will be adopted. Fixed knowledge of fundamental processes is no more and no less essential than mental attitude, habits of thought and emotion, and working ideals. Something more than drill is needed to get these ingrained. The selection of suitable subject-matter for work and study in the grades, the organization of this material with reference to the periods when important instincts, interests, powers, and capacities become prominent, the development of desirable ideals, motives, and habits in the pupils—these things must be considered when we undertake to say what are the "essentials."

Recent studies in retardation have involved the fallacy that the proper place of a child in school can be determined by age alone. What is needed to put education on a scientific basis is an examination of each child's physical state and mental power at the beginning of school life, on the results of which all the work should be based.

We have been accustomed to say, "The teacher is the school," and this is still true, but in our cities with their large buildings and many teachers, individuality is in danger of being submerged and progressiveness of lacking stimulation. Superintendents and supervisors suggest and encourage, but their contacts with teachers are relatively infrequent. Instead of being what they would like to have it, the school will be just about what the principal makes it. In a certain sense, therefore, we are justified in saying, "The principal is the school." The right kind of a principal will weed out poor teachers, will make teachers of uncertain value into good teachers, and good teachers into better teachers. He will know what progress every pupil in the school is making, and, having a view of the whole school as the teachers have not, will be on the lookout for opportunities to advance pupils either individually or in classes without waiting for fixed promotion dates.

In considering waste in education, no problem looms larger than the preliminary and after-training of suitable principals. Given a salary that will enable the superintendent to select persons of tested strength and character for these positions, no effort is expended to better advantage in checking waste than that which the superintendent devotes to conferences with his principals. The principal can either make or mar the most carefully planned scheme and in his hands rests the success or failure of any plans that may be formulated for economizing time in elementary education.

C

H. B. WILSON, SUPERINTENDENT OF SCHOOLS, DECATUR, ILL.

What I shall present this morning is neither a report, a preliminary report, nor a report preliminary to a report. I merely wish to bring to your attention, by means of the outline just distributed, the fact that the committee from the Department of Superintendence has developed this brief logical outline of the whole problem of economy of time in elementary education in an effort to discover where it should begin its work and in what direction it should proceed in an effort to define for itself the phases of the problem which should bring largest returns in the shortest time.

You will recall that this committee was created in response to a resolution presented by Professor Henry Suzzallo at the meeting of the Department of Superintendence at Mobile upon the conclusion of his address before the department, presenting, in the absence of President Baker, chairman of the committee, a preliminary report of the committee from

the Council on "Economy of Time in Education." Near the close of his address Professor Suzzallo said:

> The main requirement at this point in our progress is to investigate the waste in elementary schools and to make definite proposals for eliminating the archaic and least useful matter of the course of study and to propose more ecomomic methods of teaching.
>
> To this end I move that the Department of Superintendence appoint a committee of five on Economy of Time in Elementary Education, this committee of practical superintendents to co-operate with the general committee on Economy of Time in Education.

This committee as originally constituted consisted of Superintendent Calvin N. Kendall, then of Indianapolis, chairman; Superintendent J. H. Francis, Los Angeles; Superintendent E. O. Holland, Louisville; Superintendent Charles S. Meek, Boise, Idaho; and Superintendent Frank E. Spaulding, Newton, Mass. Upon assuming his new duties in New Jersey, Mr. Kendall asked to be relieved from his duty on the committee. After considerable correspondence the present chairman accepted appointment to this vacancy on the committee. Later Superintendent Meek found it necessary to be relieved from duty on the committee, owing to the pressure of other work, and I now announce the resignation of Superintendent Holland for the same reason for which Mr. Meek resigned. Superintendent Meek's position on the committee was filled by the appointment of Professor Frank E. Thompson of the University of Colorado, Boulder, and Superintendent Chadsey, president of the Department of Superintendence, has indicated that he will appoint President O. I. Woodley of the Farmington, W.Va., Normal School to succeed Superintendent Holland on the committee. As now constituted the committee consists of three superintendents, a normal-school president, and a college professor working in the Department of Education. The committee, therefore, represents more lines of interest in reference to this problem than it did as first organized.

At this time we merely present the following outline for your attention and criticism:

ECONOMY OF TIME IN ELEMENTARY EDUCATION

I. Definition (logically first but must be answered last).
   1. Is economy of time to be sought thru lessening the time devoted to elementary-school work? If so, should total time devoted to elementary and high school be lessened?
   2. Or is economy of time to be sought thru securing larger results in the time now consumed?
   3. Or is economy of time to be sought thru a combination of 1 and 2?

II. Lines of investigation in seeking solution.
   1. Course of study problems:
      A. Modifications needed as to content.
         a) Eliminations needed to remove archaic and least useful materials.
         b) Significant additions necessary.
      B. Modifications needed to secure economic amalgamation and wise correlation of subjects. What separate subjects or lines of work should the program of studies provide for?

C. Modifications needed to secure that sequence of work which is essential in socializing and psychologizing the materials of instruction.
D. Modifications needed to secure such differentiations in work as are advisable in upper grades.
E. Modifications needed to secure flexibility in adapting to varying abilities and to different communities.

2. Problems relating to teachers:
A. Giving them an adequate vision as to the function and possibilities of public education in our democracy.
B. Securing efficient, artistic (appreciative, sympathetic) teachers.
C. Perpetuating their academic and professional growth.
D. Preventing wastes resulting from short professional life of teachers.

3. Problems relating to teaching:
A. Securing adequate motivation of children's work (importance of texts in use).
B. Eliminating useless, meaningless, ineffective procedures.
C. Varying the technique of teaching to suit the outcomes or results sought.

4. Problems of organization:
A. What systems of grading and promotion are most advantageous in securing economy of time? (Effects of attendance, preventing failures, avoiding retardation.)
B. Advantages of special schools or classes in securing economy of time.
C. Relation of differentiated courses with reference to vocational ends to problem of economy of time. See D under 1.
D. Relation of vocational guidance to securing economy of time.
E. How may the schools be directed and used in the interest of modifying the public attitude toward educational effort?

5. Development of standards which shall:
A. Set ends for attainment.
B. Enable the measurement of results secured.
C. Need of standards in estimating economy of time.

We hope you will not only react upon this outline here as time may permit, but that you may carry it with you from this meeting and write the committee any suggestions you may have as to the problems of importance for their study and investigation with a view to a future report.

This morning I wish to call attention to the following articles in the outline: II, 1, A, B; II, 3, A, B; II, 4, E; II, 5, A, C. In the light of what I have said in calling your attention to these articles in the outline you will see that it is my belief that the first thing to do is to tabulate rather carefully what is being done at this time in the country which may have suggestive value in indicating ways to economize time. Our first attack should be from the empirical standpoint. The articles under I, while standing logically first in the outline, must be the last ones to be answered from our study. II, 5, standing last in the outline, is probably the first problem which should be solved that we may have a basis for knowing our progress and attainments from the standpoint of economy.

In conclusion I wish to urge you most earnestly to give us your help, refer us to schools that are doing work which may throw light on our problem, refer us to bibliographies which may be of service, use your influence

to promote the discussion of this topic upon educational programs. If all of the educational public which should be interested in this problem will give it the attention due it, after three or four years of careful study your committee should be able to make a report of significant value.

D

FRANK E. THOMPSON, PROFESSOR OF EDUCATION, UNIVERSITY OF COLORADO, BOULDER, COLO.

We cannot proceed far with the discussion of this subject until we have decided upon certain essentials, and we cannot say what is essential in elementary education until we come to some understanding as to what is essential in any education. What is essential will depend upon whether we want to select a few or to train all. If we are selecting it makes little difference what the course of study or the method so long as these are such as to permit the survival of but a few of the best. If we are training, it is incumbent upon us to give the better rather than the worse training. If we are training all—and no less than that is demanded of us—all our educational endeavor must be estimated to a nicety with respect to its effect. If we are selecting a few, the chief consideration is that the work shall be difficult, or require peculiar gifts. Linguistic refinements, tight-rope walking, singing, doing the chores on the farm are all good for the selection of certain types. Our present educational procedure seems to be dominated in a measure by both of these conceptions. Our defense of the traditional cultural education sometimes leads us to emphasize selection; our belief in "practical" education sometimes leads us to "practical" extremes. It would seem that education must hold to a middle course. We must train all in some sort of way but we may make our régime peculiar and difficult enough to select a variety of capacity and genius. Our boast that we "kill off" and frighten away is anomalous if not gruesome. The social order can utilize the peculiar and special contribution of everyone. If we are to educate all, and in the most economical way, we must consider carefully essentials in respect of (1) aim, (2) material, and (3) method.

1. ESSENTIALS OF AIM

Each human being should be, to some extent at least, a participant in each and all of the human occupations. As a child, he should be introduced to each and all of them and should be given opportunity to become at least moderately proficient before the conclusion of elementary education. The educated man is proficient in several of the occupations and, to some extent, at home in all of them. Experience in any occupation should put the learner in touch with the particular truth, beauty, and righteousness which is the perfection of that occupation. To put it another

way, training in the occupations should result in proficiency in them on the higher human levels.

Occupations, as the term is used here, are outgrowths of instinctive activities; they are long-circuited instincts. The instincts are limited in number; they are limited, too, as independent mechanisms, hence much of the confusion as to their number. There are fairly distinct occupations, however, for example, fighting, dodging, mating, protecting, educating, prying, constructing, collecting, strutting. The activities of the instincts in these occupations, and their complications and overlappings, give us the common, human: *habits*, for example, customs, manners, ways in dress, in address, eating, sleeping, exercise, neatness, politeness; *dexterities*, for example, of the body, of speaking, reading, writing, vocation, language, number, drawing; *attitudes*, for example, interests, tastes, enthusiasms, preferences, prejudices, interest in learning, enthusiasm for efficiency, prejudice against dirt-meanness, preference for effort—truth—beauty—justice; *information*, for example, of nature, self, geography (political, social, economic), history, vocations; *ideals*, for example, vocational, moral, civic, scientific, æsthetic, of "paying one's board," being a factor in one's community, knowing and adding to what is known, making things more beautiful. The product of the elementary school should be well advanced toward the attainment of these things. He should be so far advanced that he cannot lose ground; no greater economy could be effected than by this means.

2. ESSENTIALS OF MATERIAL: CHILD AND CURRICULUM

a) The child, for the purposes of education, is a composite of instinct-emotion processes. These processes are the psycho-physical mechanisms built up by the selection of the ages to react effectively to their appropriate stimuli. Primeval man had certain great situations in which to act, certain emergencies to meet. There was no time for deliberation. The man that evolved from primitive man differs from him as an organism in no essential particular. except, perhaps, in greater imitativeness—educability. The modern man is made up of instinct-emotion processes, but he lives under conditions which should train, long-circuit these processes. Man is the descendant of a creature much like man, just like him save that the ancestor lived in a time and environment in which there was no culture. Primitive man plus culture equals civilized man. Civilized man minus culture equals primitive man. A child is, mentally speaking, a primitive man with this difference, however, from the primitive man: that the latter could not get at a culture while the child usually can—if the schools and his parents will keep out of the way! The thing common between the child and the primitive man is this: they are possessed of the same instincts and of the same number of instincts, if not of the same instinct-capacities.

b) The curriculum is usually an abstract and condensation of civilization, logically arranged. Abstraction has been made of the symbol.

Condensation has squeezed out all romance. Logical arrangement has as often as not reversed the psychological order. The present-day curriculum exists, in the main, in textbooks which are condensations of the lore of occupations or divisions of occupations. Condensation has, as intimated above, as a rule, squeezed out all of the things of action—usually of feeling and volition also. Textbooks are, as a rule, highly schematic and, in general, are addressed to the intelligence only. They should be outlines of exercises, actual things for the child to do with his big and little muscles—or suggestions for such—in, and of, the various occupations, arranged as to difficulty in an ascending scale. The earlier exercises should be of fundamental operations; the later, of accessory operations.

3. ESSENTIALS OF METHOD

The child can be educated thru the employment of his activities in the occupations of the race, with care that all his instincts and emotions are involved—none too much, none too little—and that all are involved in right relations to each other and to the "culture" of the group of which he is a member. His incentive to the development of concepts will be his needs. Determine his environment and, by indirection, direct—ability is his natural culmination. We should remember that at first culture was passed along by imitation of action, and that it is still so passed on when we permit. The educand learns thru participation. He later associates symbols (words) with his experience. This helps in communication and it helps in thinking. The crowning mistake in education is made when it is falsely imagined that any considerable part of culture can be passed from one to another, or from one generation to another, solely by means of symbols—words, diagrams, maps. Culture can be passed along in real experience only—by imitation, and by trial and correction. Of course, symbols should be passed over with the experience, for their value in association and thinking. Without the experience, they are practically useless—in time, they are harmful. We learn, by and large, mainly thru imitations of motions. The motions imitated may be the superficial ones—of words and grimace in general—or they may be those peculiar to, or associated with, the instincts and the more fundamental human occupations. Education is the process which gives appropriate activity to each and all of the instinct-emotion processes—always to such extent as really to arouse the emotion. Coincident with this, there will be association of the right symbols, nicely distinguished and graded.

Educational emphasis is wrong: in the schools it is too much on the symbol; in the homes it is weak both on right experience and symbol. The school should attempt to even things up—to correlate all of the child's experience. The teacher must have and keep his perspective. The school should insist upon the *whole* experience—its duty is greater now than ever before. In the good old days, there was a fair division of labor between

home and school. The former gave experience, the latter fitted the symbol thereto. Now we must devise exercises that will provide both experience and symbol, all the way along. These exercises must get down into the child. If the home, the industries, and the school can co-operate, the thing can be done adequately. Probably education will remain but a sorry expedient until this compact is formed, but the right teachers, even under modern conditions, can do a great deal by really calling up such experiences as the child has had. In the country, things are not bad. In the city, they would be better with sane labor laws. School gardens, manual training, cooking, laundering, sewing—any sort of thing rightly used—would help. Textbooks give little more than symbols and the logical organization of them.

The earlier man was in touch with all of this culture and, as this had been produced by his and his immediate neighbor's and ancestor's efforts, he could readily participate in it; with participation, he achieved for himself an education. The present situation as contrasted with the earlier one is obvious. The but-little-sorted accumulation of unnumbered ages and races is all about the one who has still to learn and there are few cues as to what to do next. We have tried to get out of the dilemma by educating that part of the child which has to do with symbols only. Such ideas as he gets, he gets in the old manner, by his experience, and when we teach him symbols he does his best to attach them to some part of this experience; he attaches too much, too little, or the wrong things. We assume that back of the symbols—words, schemes, etc.—taught children, there is the appropriate experience. As a rule, this is not the case. We even, at times, force words and special arrangements of words upon children that they may later have them as receptacles for meaning. We are still crazy on this matter of verbal memory. Adjusting words to experience is instinctive with children; facility is partly a matter of growth, partly a matter of habit. Crowding is fatal—it causes short-circuiting. We are apt to be in a hurry for facility in talking; our most serious mistake is made here. Talking easily becomes a substitute for, an evasion of, action—a "side-stepping." Talking gives a pleasant sense of proximity to reality; it has in it something of imminence; it is prophetic—but it cheats its devotees of experience. Our schools encourage talking, insist on talking, perfect talking until impotence is attained—then we insist that we are not teaching enough grammar.

We will get out of the present dilemma only by bringing education to bear upon the things, the processes, in the educand which endure; and verbal memory processes, alone, do not endure. Taken alone, they are of little use when they do. The things which do endure are the attitudes, the capacities, and the abilities of the fundamental processes—the instincts. These can produce new verbal forms and arrangements. They are doing so when we give them a chance. We might do a great deal for the language

and for literature if we would encourage expression instead of always cramming it into the antique molds. Of course, it is essential that the educand should come to an appreciation of language in respect to all of its functions and especially of its great function, in thinking. There is no more wonderful achievement of man than this speech which permits him to combine his experience in well-nigh unlimited ways; it is important, infinitely important, but its mastery is not attained by our clumsy methods of direct and too early attack.

E

J. H. FRANCIS, SUPERINTENDENT OF SCHOOLS, LOS ANGELES, CAL.

In the interests of economy I am convinced that best results may be obtained by a brief and direct description of what we are attempting to do in Los Angeles in the way of reorganizing our school system.

It is to be understood that the plan is not to be dubbed the Los Angeles plan. I do not know how many other cities are attempting the same things, and with what results. Recently someone mailed me a copy of an address by Edward Van Dyke Robinson, University of Minnesota, on the "Reorganization of the Graded and High Schools." I did not learn who this kindly disposed, but unkind, friend was. Since reading it I am certain that I shall practice plagiarism in this paper and upon future occasions. In fact, I discover that either he or I have been at it in the past, for I might well content myself with calling your attention to his address, which has been published in pamphlet form and which fully covers the points involved in this discussion.

OUR PLAN

The plan toward which we are working in our city, broadly speaking, follows:

1. One or two years in the kindergarten. Our state law compels the admittance of children to the kindergarten at a tender age, a prophecy of the days when the nursery shall become an integral part of the public-school system. This ofttimes results in a child spending more than one year in the kindergarten, and in turn raises serious questions concerning kindergarten methods and content of work.

2. Six years in the elementary schools, assuming responsibility for the physical, mental, and spiritual development of the child between the ages of six and twelve. Because of economic and social conditions, and principally because of the wicked folly of educators hiding behind the gray old fallacy of conservatism, this age limit too frequently reaches thirteen, fourteen, and even fifteen, thereby robbing the individual of the most sacred thing in all the worlds that be—his hidden pride and confidence in the efficiency and power of his own personality. Fortunately the boy, for it is usually a boy, finds some sort of deviltry in which to give expression

to this personality, and thereby retains a portion of it which his good sense may later lead him to turn into legitimate channels.

3. Three years in the intermediate or junior high school, which, if the child has been fortunate, submissive, and not too individualistic, may be completed at the age of fifteen, covering nine years of school work.

4. Five years in the high school, which brings the student to the age of twenty; a good average age to begin the business of life, despite the philosophy of my friend, President Benton, who holds we should remain infants until twenty-one years old.

This general outline of work designed to meet the needs of the largest number of American boys and girls is supplemented by:

1. The trade school admitting pupils according to physical development, irrespective of academic attainments.

2. Continuation schools open before and after school hours, offering work in manual subjects and optional with the pupil. This work we hope soon to enlarge and include in it music, art, mechanical drawing, and public speaking.

3. Vacation schools during the summer months, open in the forenoons and designed to conserve two purposes: (*a*) To occupy the time of the younger children, who would otherwise be on the street, in music, folk dances, play, gardening, natural language work, drawing, and manual arts. Since this is developmental work no effort has as yet been made to fit it into the great regular system. (*b*) To furnish regular academic work for those who wish to make up subjects in which they have failed, or secure the coveted official certificate in subjects yet to be taken before they can be vouched for as educated young men or women. Since this work is both uneducational and undevelopmental, it adjusts itself excellently to the regular scheme and has great advantages as a time-saver and hope-preserver. Many a pupil returns to work in the fall with new hope and courage because he is up with his class and can see the end ahead. It also keeps him out of more unprofitable occupations and saves the city money in carrying him an unwarranted length of time in the school system.

4. Night schools of all grades and for all classes of people. But few phases of our school work have greater significance than this one. Plan and purpose upon the part of the individual, so lamentably lacking in the regular school system, are prominent characteristics here. If this nation has one paramount danger it lies in the number of her school children who are passing thru her schools just to be passing thru, wholly lacking in intelligent or worthy purpose.

5. Special schools for the unsocialized individual who refuses to adjust himself to the regulations, formalities, and conventionalities of the schoolroom. These are the eddies with which the driftwood of the school system may be gathered and treated until sufficiently seasoned to again risk in the great educational current. They are necessary and strikingly convenient.

6. A liberal use of the ungraded room, which indicates a tardy recognition of the fact that, since children will differ in some essential points, it is folly to subject them all to the same educational treatment and expect them to assimilate all the ingredients with equal facility and profit.

7. The social center, not yet a year old, but a most promising educational youngster. Similarity of this to the German plan is to be frankly conceded, which leaves a beautiful opening for the American patriot to orate on the virtues of the American and defects of the German systems. The German system, however, is not to be adopted for our needs, but adapted to them. There must remain one fundamental, vital difference between the present German system and the future American plan: the latter must have no blind alleys, and her educational cross-roads joining the main highways must be kept in as good condition as the highways themselves. This becomes quite possible with the assumption that the coming generation of American educators will cease to be frightened at the imaginary chasms between these highways, and discover that a good traveler who has moved on his own steam upon one will need fear no great hardships or difficulty in traveling on any other. This also suggests another significant difference: American vocational schools can no more afford to sacrifice liberalizing studies than can academic schools afford to eliminate constructive and applied work.

From the topic printed on the program for today, this paper should concern itself principally with that part of the school system including grades seven, eight, nine, and the organization known as the intermediate or junior high school. At present we have five such, enrolling approximately 3,000 pupils. Four of these are five months old and one can boast a year of experience. Three uniform courses are offered in each of them: a general course, a commercial course, and an elementary industrial course.

These courses are planned with two classes of pupils in mind: (*a*) those intending to enter high school, and (*b*) those electing to leave school at the end of their ninth year. Both are given full tenth-year standing in the high school.

In attempting to plan the work for these two classes we also try to keep in mind the individual, independent of what he intends to do, or where to go. This, of course, is the age-old problem and the fundamentally important one, likewise the one most poorly solved.

In the seventh year one option, and in the eighth and ninth years two options, are allowed out of a group of six or seven studies.

For the pupil going thru the intermediate school we expect to accomplish the following:

1. An ability upon his part to do some thinking that may be more or less his own, probably less. We concede that this is ambitious, and we may have to be content with limited results. A very little, however, would be refreshing and give hope. Doubtless American boys surpass

those of all other civilized countries in their willingness and ability to do things, and in their unwillingness and incapacity to think logically, consecutively, and deeply. In this latter the American boy is surpassed only, if at all, by the American girl, with honors close. The cause is easily discovered. The system, not the children, is at fault. We have been asking the pupil to recite what he has just read from the pages of a textbook that should never have been published, and never would have been, save for the money there was in it. The lesson begins on page 10 and ends on page 12, and except for these pages it begins nowhere and ends at the same place. Since the pupil's passing thru the grade, rather than passing the grade thru the pupil, is the thing to be desired by him, and too often by the teacher, principal, and superintendent, and since this is accomplished thru satisfactory recitations, the recitation in turn becomes the important activity of the average schoolroom. Thinking is of minor consideration. The time, energy, and life wasted in recitations in the American schoolroom would serve as the comedy of the ages were it not the tragedy. It might be legitimately asked how the intermediate school could improve upon the grade school in leading pupils to think. The reply must be qualified, but a specialist, or semi-specialist, who is supposed to think more deeply on his specialty, must be conceded to be better prepared to lead his pupils to do the same.

2. It accustoms the pupil to departmental work, and hence prepares him for high-school methods. The death-rate in our ninth year, or first year of high school, is alarming. This again is easily accounted for. The pupil who has enjoyed the maternal care of a conscientious teacher, who knows his strong and weak points, and is in turn equally well known by him, finds himself lost in a great high school with no one to look after him, tell him when to get his lessons, and how to conduct himself. The change is too violent and too sudden. He fails, becomes discouraged, and drops out. Our experiment so far has resulted in 18 per cent in the ninth year of the intermediate schools failing in one or more subjects, as against 42 per cent in the same grade in our high schools.

Not only does the pupil become accustomed to departmental work, but he has the advantages of it. These are incomparably great, compared with the old plan of one teacher for the entire curriculum. The idea of a mother-teacher belongs to preadolescence and is suited to children. Adolescent boys and girls are entitled to learn from those who are masters of what they teach. This is impossible when one person is required to teach arithmetic, geography, history, literature, language, science, penmanship, music, art, ethics, hygiene, agriculture, needlework, etc., the etc. to include those subjects which may have escaped my memory. Specialists and specialization offer serious problems in education, but they are not hopeless ones, as are those presented by the unprepared teacher. Teachers are not at fault. They are the victims of a system that demands the

impossible of them. Nor can departmental work be brought to its highest efficiency under regular grade-school conditions. On account of lack of numbers of equal grade, diversity of interests running thru so many grades, intricacies of programs, and ideals of principals and teachers, departmental work in the grade schools meets with unnecessary difficulties.

3. It conserves his time and interest. Six years is sufficiently long to give to the mastery of the arts. The last two years of grade schools naturally occupy themselves with repetition and dead matter. An attempt has been made to enrich these years by the introduction of new material. The result has been an educational hash that has in it too many of the elements of failure. The number of young souls lost thru lack of interest in work that is a repetition, or work superficially done, is a startling commentary on the wisdom of school men and women. The adolescent youth begins to inquire, reason, and judge, and he must have material upon which these qualities of mind may work.

Of all the inexcusable follies to be chalked against us as teachers, possibly that of compelling the child to repeat the work of an entire grade, because of failure in one or more subjects, is the most glaring. It is possible to avoid this in the grade schools, but inconvenient. This inconvenience, while not conceded, is yet the dominant cause for the practice. In the intermediate school it disappears naturally and necessarily.

I do not hesitate in the belief that under a well-organized system of intermediate schools the child will leave the school one year ahead, in development, possession of knowledge, and the power to acquire it, of the pupil of the same grade under the present plan. This is an extremely conservative statement of my hope and belief.

4. It offers to him organization and equipment not possible under the grade plan.

5. It should develop in him social- and self-responsibility at an age when responsibility to society and to himself becomes most important. The theory that the older and stronger pupils of the school are to look after the interests of the younger and weaker ones is beautiful. It has one serious defect: it does not work. Facts are, the farther our school children progress in the system the less are they disposed to concern themselves with the interests of anyone other than themselves, or their friends, and we are sending out armies of boys and girls, men and women, possessed of the spirit of getting what they can and giving as little as possible in return—the spirit that in social, political, and economic life is a menace to the nation.

These schools should develop student government and other student activities offering opportunities and encouragement for giving of self to a legitimate and worthy cause.

Too much is being attempted for the child, too little by him. Too many safeguards, restraints, too much protection, advice, and guidance

will not produce a race of men and women with the mettle of our fathers and mothers. They developed the real stuff within them thru early sharing the responsibilities of life and playing their part in the game. Somewhere below the university and below the high school we must lead the individual to recognition of the fact that the world owes him just what he is worth to the world, and he owes himself just what he is worth to himself. This belongs to the period of adolescence, and is very difficult effectually to develop in a school where the preadolescent child so far outnumbers the adolescent. Our grade schools are usually dominated by either the atmosphere of the child world or the world of men and women. It is a rare corps of teachers with a rare principal at the head of a school who succeed in harmoniously blending the two worlds. Much of the lack of interest in and dissatisfaction with his school, and most of the bluff, bluster, and blow of the average eighth-grade boy is due to his environment, which is not in harmony with his nature, and the average eighth-grade girl is equally affected, but in somewhat different form.

6. The intermediate school offers opportunity to secure men teachers for seventh- and eighth-grade pupils. As this convention is composed largely of the male contingent I leave it to you to pass upon the merits of the proposition. It should be noted also that the plan does not exclude women teachers, and while teaching is not a sex problem it will be conceded that as long as men and women differ widely in their experiences, the adolescent mind should come in contact with both the masculine and feminine attitude of mind and viewpoint of life, if the child is to keep his mental balance.

7. The intermediate school concerns itself with the child not going to high school. The American high school has grown within the last decade to become the greatest educational institution in the world, largely because it was compelled to concern itself with the interests of the pupil not going to college. He was the more important because there were more of him.

The intermediate school in the coming decade will be doing for the boy and girl not going to high school what the high school is now doing for the boy and girl not going to college, when it will surpass the high school in importance for the same reason. The base of society always has been, and always will be, more important than the apex, for the simple reason that it acts as a support to the apex. This, be it understood, however, is not its only or main function.

The high schools, in their efforts to care for the boy and girl not going to college, have increased the number of college students manyfold. So will the intermediate schools increase high-school enrollments. The colleges are coming to recognize that the high-school pupil who has prepared well to leave school at the end of his course is well prepared to continue work in college; so will the high schools discover that the intermediate

pupil who has taken greatest interest in, and given most thought to, his work in the intermediate school is best prepared to do work in the high school. The kind of work is of minor importance, compared with the quality.

But someone will raise the inquiry here of what can be done for the child in the seventh, eighth, and ninth years to prepare him to leave school. The reply is, anything the teacher and system are prepared to do. The limitations are not in the pupil, but in the system and teachers anticipating the opposition of the psychologist, who with all his wisdom has failed to discover the psychological, physiological, and sociological necessity for reorganizing a school system that violated the laws of each of these sciences.

I call attention to the growth of education during the last quarter of a century, in which time we have witnessed the high schools advancing far beyond what the colleges were then doing, and the colleges occupying fields then unthought of. The grade schools in music and art have outrun the dreams of university enthusiasts of a quarter of a century ago, if there were any at that time. To say that we have reached the limit of the child's capacity is to indulge in academic twaddle. We may be reaching the end, but which end?

8. The intermediate school should help the child to find himself. Possibly no greater service can be rendered him by the public schools. Certain it is that too few do find themselves in their school days and too many who do, do so too late to take advantage of all or much the schools have to offer them. The belief that a young person is not prepared to decide upon a vocation until he has finished college is dangerous and wasteful. The young people of this country must know earlier what they are to do in life; whether they do it or not is of minor importance compared with what they become in preparing to do it.

A system of education that is worthy the time, effort, and money spent on the American schools should be one of widest possible opportunities and offer greatest temptations to young people to discover their best qualities and powers. It should also enforce the necessity of using these qualities and powers in serving mankind. Vocational advisers may be necessary and helpful, but vocational subjects properly presented offer a safer guide to young people in making a choice. This can be offered with only limited success in the grade schools; the intermediate schools furnish excellent opportunities for their introduction.

The intermediate school has distinct advantages over the six-year high school, which begins with the seventh grade. This is especially true in the larger cities. In some of the smaller districts where, as in southern California, they are erecting expensive high-school buildings to accommodate a small number of pupils, it would seem best to admit the seventh and eighth grades to the high school.

In the cities, however, the high schools are usually crowded and almost uniformly too large in numbers.

The transition from grade to departmental work should be gradual; to make it so is one of the distinct problems of the intermediate school, where it can be better worked out than in a large high school with its own and different problems. The high schools have not solved the transition problem between the eighth and ninth years. To make the break as violent between the sixth and seventh as it now is in the ninth would add to our difficulties.

Seventh- and eighth-grade pupils are too old to associate in school with first- and second-year children, but too young and inexperienced to work on an equal footing with eleventh- and twelfth-year pupils.

In most states children are compelled by law to remain in school between the ages of six and fifteen, inclusive. A school, therefore, that naturally completes its work with the child at this age is logical. Its business will be to solve the problems raised by pupils of these grades and to meet their needs. Thus it can and will do better than the present high school.

The item of transportation to high-school centers is an important one and the unnecessary dangers to which young people are subjected in our large cities argue strongly for the organization of intermediate schools within walking-distance of practically all pupils.

To include the ninth year in the intermediate insures an additional year's schooling for a very large percentage of pupils, who will remain to finish with their class but who would drop out of a six-year high school upon reaching the legal age.

The three divisions of the school system are psychological, sociological, and logical. The intermediate school, however, assumes its true significance only when considered in connection with the extended high school.

Six years in the elementary schools, three years in the intermediate, and five years in the high schools offer opportunities that will work a revolution in our educational history. Six years will be given to the mastery of the arts, the remaining eight to the development of men and women and their preparation for Junior work in college or for definite activities in life. Then will conservation in school work lose much of its significance and the American system of education be truly for neither the rich nor the poor but for the American boy and girl.

The cost of education under this plan will be increased, but the true educator concerns himself much less with the cost than with the returns of education, and these will be greatly multiplied over present returns.

DISCUSSION

JOSEPH SWAIN, president of Swarthmore College, Swarthmore, Pa., spoke from the standpoint of one who believes that economy of time in education will necessarily be worked out chiefly thru the experiences of teachers in the different fields of education. The teachers in the grades will have largely to determine what can be done in the grades, the high-school teachers what can be done in the high schools, and the college teachers

what can be done in college. He expressed his willingness to accept as entrance subjects to college the subjects which the high-school teachers find best for each individual student. If each pupil pursues in each grade what is best for him there, and if the work is done in such a thoro manner as to enable the teacher in the grade above to build his instruction on the work done in the grade below, then the teacher in one grade should determine the fitness of the pupil for promotion to the grade above, whether it be within the school or from school to college.

Dr. Swain commended, in the main, the paper of President Baker, read at San Francisco, on the economy of time. He was satisfied with the provisional time scheme presented as an ideal toward which to work, namely, elementary education from six to twelve years; secondary, from twelve to sixteen years, and college, from sixteen to twenty. The reduction of the number of grades from eight to six may take many years. There are many schools, however, where the reduction from eight to seven grades has been very successfully tried. If time and experience can justify six grades instead of seven, the two years' saving of time would be secured.

Dr. Swain pointed out that the often-reiterated statement of the German schools saving two years in time as compared with the American schools is not strictly true, and would be irrelevant if true. We would not bring to America the German *Gymnasium* if we could. It is military in character and admirably suited to German civilization, but its spirit is not suited to American ideals. Besides, the German students do not finish their courses in the *Gymnasium* at eighteen years of age, as it is usually understood, but at the age of about nineteen and a half years. Dr. Swain visited a number of such schools in Berlin last winter and found the average age of the graduates in these schools to be about nineteen and a half years. He quoted Dr. Russell of Teachers College, New York, who found that the average age of the graduates of these schools in Germany was between nineteen and twenty years. As a graduate of the German *Gymnasium* has about the equivalent in training of an American student who has completed the Sophomore year, the American student at a corresponding stage of advancement is not two years older but one, and where the eighth grade is eliminated, he is no older. The graduate of the German *Gymnasium* is far inferior in physical development to the boy who has had two years in college. Dr. Swain was not prepared to indorse the idea that on the whole the German *Gymnasium* graduate is better fitted for his subsequent studies and career than the American boy is for his. He was inclined to the opinion that the German boy in his system of studies at nineteen and a half years of age is not better fitted for his subsequent work than the American boy is at the same age for his subsequent work. The German boy has lost in physical development as much as he has gained in intellectual development.

Dr. Swain believes that the independent college must maintain a four-year course. If its work is based on six years of secondary training, then the last two years must be conducted on the university plan, as pointed out by President Baker. The stronger colleges can well do this. Our best colleges can adjust themselves to either four years of secondary courses or six years of secondary courses. Evolution in education must determine what is best. Certainly the college must never lose sight of the fact that the first duty of the college is to make men and women of high ideals and not make them slaves of the civilization in which they live.

James M. Green, principal of the New Jersey State Normal School, Trenton, N.J.—President Patton of Princeton University in an address at the installation of Dr. Butler as president of Columbia University said that Dr. Butler was fortunate in that he began with a philosophy of education. We are uncertain in this discussion because we have no philosophy, no definite plan of education before us. "We don't know where we're going, but we're on our way."

How can we discuss intelligently economy of time unless we define a specific thing to be accomplished and the length of time it takes to accomplish it under given circumstances?

The term education is too general, it means too much. It seems to me that we should do better to discuss economy in the terms of the curriculum; for instance, what of geometry or physics, general and special, should we teach in the schools, and how long will each require?

The Association of Colleges and Preparatory Schools for the Middle States and Maryland in their meeting of 1910 set for discussion two phases of each of several subjects, the practical and the cultural; for instance, what of algebra is essential to engineering and astronomical problems and what is simply taught for disciplinary purposes? It appeared that there was a wide difference between the amount of algebra used for one of these purposes and the amount used for the other. The technical school men were entirely satisfied with so much of the subject as would solve their problems, while the general school or college men wanted a larger amount purely for discipline.

Every principal knows how large are the claims of each specialist for his department. The teacher of penmanship wants to secure not only good letter forms but the relation of good penmanship to the development of good English; the teacher of English not only wants to secure good forms of expression, but wants to review all causes of expression. He is unwilling to recognize the fact that the correct expression of a problem in physics is an exercise in English. Indeed each specialist is disposed to charge himself with the whole of education rather than to confine himself to that which is peculiar to his subject. In this way we merge and overlap very much in our efforts. Whether we do our Latin in the college or university does not seem so important as how much Latin should we do and how best do it. We need to distinguish between essentials and incidentals.

PRELIMINARY REPORT OF COMMITTEE ON SPECIAL HIGH-SCHOOL PREPARATION OF CANDIDATES FOR NORMAL-SCHOOL TRAINING

DAVID FELMLEY, PRESIDENT OF STATE NORMAL UNIVERSITY, NORMAL, ILL.

In preparing this report your committee sent letters of inquiry to 120 state normal schools. Some of the questions asked could not be answered accurately without considerable investigation. Others could hardly admit of precise answers in any case. Possibly for these reasons replies were received from only thirty-eight normal schools. Yet these replies came from twenty-five states representing every section of the country and present a body of fact and opinion sufficiently uniform to justify, I believe, the main conclusions presented in this report.

It appears that thruout the country normal-school faculties are generally not satisfied with the quality of the high-school preparation received by normal-school students. The work of some high schools is entirely satisfactory; many individual students from other schools show excellent preparation. Our conclusions are necessarily based upon the average product. There is no disposition to indulge in wholesale condemnation of the high schools. Their principals and teachers must often bow to conditions that they cannot control. We propose merely to analyze the high-school situation from the standpoint of the normal school, and to suggest such changes as seem desirable and practicable.

The character of the instruction is almost everywhere dominated by college traditions and ideals. The high-school teachers are nearly always college graduates, usually young college graduates with no professional education, no adequate comprehension of the meaning of education, of the purpose of the school, or of the physical and psychological laws that must govern all learning and teaching. To such teachers "to get an education" is to complete a college course, and the function of the high school to fit boys and girls for college. Naturally they imitate their own teachers and bring the methods of college and university into the high-school classrooms, diluting them to suit young students and lecturing much. Hence the instruction is scholastic, bookish, abstract, with little articulation with the environment or reference to the needs of modern life.

THE CAUSE

Hence it appears that the fundamental cause of the defective preparation of our students is in the conscious aim of the high school. So long as this aim is to stay on the accredited list of the university, the best teachers will be secured for the subjects that find grace in the sight of the university visitor. In many high schools this dominating ideal determines the subjects in the curriculum and controls the work done in every one of them. This control is in the direction of further work in these branches in higher institutions of learning rather than in the clear comprehension of them as related to the students' life and social environment. Hence it follows that

> the best energies of thousands of our young people are devoted to studying the language, the literature, the wars, the politics, the religion, the customs, and the superstitions of peoples for fifteen centuries dead, while the knowledge that is needed to earn a living, to discharge the duties of citizenship, and even to appreciate the world in which we live must be picked up largely outside of school and by methods more or less irregular and ineffective.

This conscious aim of the high school determines the choice of teachers. If the one function of the high school is to fit for college, what more sensible than to secure as teachers men and women who have been thru college and know what preparation will be needed? In this way the circle is closed and the intrusion of foreign elements effectually prevented. Organizations of colleges and secondary schools have been formed in which the conditions of membership require the college to accept the high-school graduates as students, the high school to accept the college output exclusively as teachers. It is notorious that the significant advances in science and the arts have not been made by men within college walls. The greatest teachers of men have often owed little to the schools. May it not be well to make some sort of provision by which the Franklins, the Faradays, and the Edisons of the educational world may bring their ministry to the high school?

A third evil result of this ideal is a tendency in the organization of the high school to depreciate all student activities that do not directly fit

for college. The high-school program provides for each student four solid studies that count as units in college entrance. Music, drawing, the arts and crafts, domestic science and domestic art, commercial branches, and other subjects of high practical value are belittled as unworthy the attention of capable, high-minded, and ambitious young people who have the capacity and spirit to undertake arduous things. While debating societies, literary clubs, musical organizations, and other voluntary student activities may be tolerated or even encouraged as a means of holding the students in school that they may pursue the real studies, the high educational value of these organizations is disparaged or ignored. Every teacher can recall young people who while in the grammar school made a good start in a musical education, but after entering the high school found it necessary to abandon their music in order to keep pace with their classes. To choose otherwise was to fail of graduation. So frequent is it for persons of eminent musical ability and accomplishments to drop out of the high school that it is frequently assumed that conspicuous talent for music is evidence of deficient intellectual power.

THE REMEDY

The first need of the high school is a change of aim. It must front the actual needs of life as found in shop and store, in farm and home. This does not mean that all instruction shall be vocational; the physical, social, and cultural needs of men and women are facts of life. But it does mean that we must assess the actual educational value of every study in the curriculum, of every detail of organization and method, and conduct our schools in such a way as to secure the maximum of useful knowledge, skill, power, appreciation, and character. To make such an assessment of values is no easy matter. We lack a universally accepted standard. We are likely to be misled by prejudice, by habit, by traditional doctrines of formal discipline, intangible and unprovable.

Then our organization must be in close articulation with the total environment of the student. Thus if the high school does not offer instruction in instrumental music, it must find a way to supervise and credit private instruction and count it for graduation. If the student of domestic science has regular home duties in this field for which the school instruction affords direction, some means should be found for rating the excellence of the performance and crediting the same in the high school. The school must not set itself up as the one institution that shall bend everything else to its calendar and needs.

Such a change of conscious aim is not easy to bring to pass. The university looms large above the horizon of the country town. If the rival village ten miles away has had its high school accredited, we cannot afford to live in manifest inferiority. Our school board scurries about, telegraphs for the university high-school visitor, and begs him to name the terms on which the coveted relation may be secured.

In every country town there are a few influential citizens of the well-to-do or professional classes who wish to prepare their children for college. Disliking to send their boys and girls away to boarding-schools, they bring all possible pressure upon the school board to place their high school on the accredited list.

It is not easy for a school board to resist this pressure even tho itself holding a rational view of the function of the high school. For these and other reasons, the smaller high school (and it is from the smaller high schools that most normal-school students come) is obliged to shape its program and organize its work with reference to college standards.

The second need of the high school is a change in the curriculum—not merely in the interests of future teachers but of all the students. In the small high school where but one course is taught it should not be the course prevailing at present. If the best single course is arrived at, it will not be a poor course for future teachers. In the large high school where many courses are provided for varying tastes and vocational needs, certain studies may properly be recommended to all who look forward to the vocation of teaching. It is by no means necessary or even desirable that all elementary teachers should have had the same high-school course—no more than that all the sixth-grade teachers in a city should be of the same relative ability in the various branches taught. The school system is all the richer because of the individual talents of each. Nevertheless, as appears below, there are certain arts and knowledges of high importance to all elementary teachers for which an adequate foundation should be laid in the high school. All intending to become elementary teachers should include them in their high-school course.

The question arises: Do high-school students decide to become teachers early enough to affect their choice of studies? The general opinion is that they do not, but I am not sure that this opinion is in many cases based on actual investigation. In one large normal school twenty-three of the twenty-six women of the faculty had decided to become teachers before they were sixteen. A majority of the students in the same institution had decided at that age. In another state normal school all the high-school graduates were polled with this result:

37 per cent decided to become teachers before entering the high school.
4 per cent during their first year.
4 per cent during their second year.
14 per cent during their third year.
22 per cent during their Senior year.
19 per cent after graduation.

Of twenty-seven women in the faculty of this school, eight had decided to become teachers before they were ten, nine others before they were sixteen. Of the twenty-three men in the same faculty, ten had decided before they were sixteen.

From this it appears that by the middle of the high-school course enough students have chosen to become teachers to make it worth while to offer any needed courses. This number may be largely increased if high-school teachers take a lively interest in the future of their students. An observant teacher cannot fail to note among his pupils those who have a marked fitness for teaching. A word of suggestion or encouragement at the right time will often decide the matter. It ought to be somebody's business to advise young people as to what they shall do after leaving school—somebody's who knows the young people and knows the world. A wise teacher often can do this better than the parents themselves.

From the reports received it appears that the high-school curriculum thruout the country contains substantially the same elements, but varies somewhat in the relative time devoted to the different branches of study. The standard graduation requirements are usually sixteen units, each unit being a year's work in a subject with daily recitations. An approximate composite of the various programs actually completed by the high-school graduates in the normal schools reporting is as follows:

English including grammar, rhetoric and composition, English literature, reading and public speaking	3.8 units
Foreign languages—Latin, Greek, German, French, and Spanish	3.4 units
Social science—history, economics, civil governme	2.6 units
Mathematics—algebra, geometry, trigonometry, and arithmetic	2.0 units
Physical science—physics and chemistry	1.2 units
Biological science—zoölogy, botany, and human physiology	.8 unit
Earth science—geography, physiography, geology, astronomy	.6 unit
Music—vocal or instrumental	.2 unit
Drawing—design, manual training	.3 unit
Agriculture and household science	.1 unit

In the East foreign language has a larger place, often constituting a full third of the curriculum. In the South the ancient languages and mathematics receive largest relative attention. In the Middle West and also in the Mountain and Pacific states larger attention is paid to the biological sciences. Drawing and design seem best developed in New England; agriculture and the household arts are just beginning to appear in ratable amount in the high-school curriculum of a few students.

The normal-school faculties reporting are pretty well agreed that for future elementary teachers there should be less foreign language, less algebra and geometry, more arithmetic, more biological science, more geography, more of drawing and the other manual arts, more music, reading, and public speaking than we ordinarily find in the high-school course. Our students before completing the normal-school program are usually of the same opinion.

In an Illinois normal school 162 students, all high-school graduates, were recently asked how many would change their high-school courses if the course was to be begun with their present estimate of educational values.

Fifty-six per cent (mostly Seniors) would change the course. Forty-four per cent (mostly Juniors) would not. Forty-five per cent would take less Latin, 11 per cent less German, 18 per cent less mathematics; while 39 per cent would take more natural science.

The following course is suggested:

Three years' work in English.
Four years' work in science.
Two years' work in mathematics.
Two years' work in history and civics.
Two years' work in German or French.
Two years' work in industrial lines.
One year's work in music and drawing.

The third need of the high school from the standpoint of the normal school is that the instruction in the various branches be more thoro and more vital. There is a general complaint that high-school students are poorly taught, that they cover too much ground with little drill and real assimilation; that they have low ideals as to what thoroness and accuracy mean in the preparation of lessons; that their work is largely memorizing things they do not understand and soon forget; that they do not know how to study; that they are poor in vocabularies and seem to lack words to express ideas with which they must be perfectly familiar. The fundamental difficulty seems to be, as pointed out before, that their high-school study is largely a thing apart from their daily life experience. They do not properly comprehend, appreciate, or assimilate the material they deal with. Thus English is the medium of instruction. Habits in the use of English are forming in every classroom. Hence if students are to use the English language effectively with correct idiom and pronunciation, it will be brought to pass most economically, not by adding more courses in English, but by paying due attention to these points in all classes. Every effort made to secure precise and orderly thinking not only aids in the knowledge of the particular branch, but makes for better English as well. The inverse statement is equally true. Every teacher should be consciously a teacher of English.

Teachers especially need to be good readers, they must speak with ease and effectiveness, and in pleasing tones. They should have read widely in literature, largely in children's literature, and have committed thousands of lines to memory. The normal course is altogether too short for this accomplishment. It should have begun in the lower grades, and have continued all thru the years of the high school.

The sciences should be so taught that the student will feel every day that his health, his happiness, and his success in life depend upon the truths they contain. They should explain natural phenomena, and industrial processes, fuels, foods, sanitation, and the rules of right living. Altho the sciences came into our high-school and college programs largely as a

protest against the old classical education with its emphasis upon formal discipline, its dependence on authority, we have gradually come to teach them as if their chief value lay in their method, in experiments to rediscover what the student knows in advance, in the verification of physical constants, and in the solution of endless problems in energy and motion. Biology should deal more with the visible forms that surround the student and which should appeal to him every day, rather than with the microscopic world.

The mathematics of the high school needs thoro revision. No other branch is so universally studied as algebra and with so little profit. The time devoted to it should be reduced to one year, its topics limited to those that generalize and extend arithmetical processes. For the ordinary elementary teacher imaginary roots are as incomprehensible and useless as the fourth dimension. The work should abound in concrete problems. Investigations that do not begin in concrete problems and end in concrete applications should be omitted. A year of plane geometry, with many practical arithmetical problems involving geometrical elements, should suffice in this branch.

History should undertake to answer this question: How did our present institutions come to be as they are? Only in so far as they answer this are events or the lives of men worth knowing. Civics is a study of rights and duties in society. It deals with the co-operative efforts of men in the state to secure justice, protection, healthful conditions, education, and sundry other things of everyday value. It should emphasize function rather than structure and machinery. No study in the curriculum is of higher value than economics. Without it the organization of modern industry cannot be understood or rightly adjusted. But to be of value it must be taught in terms of the student's environment.

Where the normal-school course is only two years in length, it is best in the high school to omit foreign language altogether and include in the last two years a study of the common branches—not a review in the sense of going over grammar-school textbooks, but a fresh study of these subjects from a higher standpoint, a study that will enlist the best energies of advanced students. A year of physical and commercial geography will set forth the conditions and purpose of human industry. Grammar is rarely appreciated by the fourteen-year-old. It really belongs in the Senior year of the high school.

The fourth need of the high school is a different standard of preparation for its teachers. Our students usually come from the smaller high schools where salaries are low. Most of the teachers there are young women recently graduated from college. Few of them have had any professional training of any sort. Those who are successful remain but a short time. Consequently our high schools are taught by a shifting corps of young, inexperienced, and untrained teachers.

Thirty years ago mature and scholarly teachers who had served an

apprenticeship in the grades were frequently promoted to the high school. They brought with them a knowledge of children, thoro familiarity with the common branches even in their higher reaches, skill in teaching. To teach the younger classes in the high school such teachers are needed today. Instead of this we find college-bred young women usually quite inexperienced and with little definite knowledge of what goes on in the grammar school. The break between the grammar school and the high school is too pronounced. The pupil finds a new organization, new branches of study, new teachers with new methods of instruction. Teachers and pupils share in a mutual misunderstanding. There is a good deal of superstition in the reverence paid to degrees. A degree is not a sacrament. It is not the outward and visible sign of an invisible and inward spiritual grace. Many teachers of slender school advantages have, thru private study, reached a finer and truer scholarship than is attained by the great majority of graduates of our colleges and universities.

All high-school teachers need as thoro professional preparation as elementary-school teachers. They need the same knowledge of the laws of the developing life of children and youth, of the psychological processes involved in all learning, of the principles and methods of teaching and school management, of educational aims, of the relation of the school to other social institutions. Many superintendents testify to the fact that whereas elementary teachers usually enter heartily into the work of reading circles, teachers' meetings, and other means of professional growth, high-school teachers stand aloof. They will co-operate in literary clubs and scientific societies, but they do not seem to realize the existence of a great body of doctrine that informs and illumines the teaching art. They are thoroly committed to the dogma, so widely prevalent in university circles, that anyone who knows a subject can teach it.

We therefore hold that, in selecting high-school teachers, school authorities should give due weight to professional education and training as well as to character and scholarship, and that teachers of extended experience, acknowledged skill, and ample scholarship gained thru private study should not be excluded from the high school because of the lack of a degree.

Altho this report has set forth what your committee believes to be certain shortcomings of many high schools, it must not be inferred that we hold the high school chiefly responsible for poor work done by graduates of normal schools. These institutions need to examine their own organization, curricula, faculty, and methods. They are not wholly emancipated from scholastic ideals and bookish methods. Their teachers are often chosen because of their degrees rather than because of their personal power and skill in the classroom. Often these teachers have had no real professional training; their experience as teachers before obtaining their Doctor's degree is sometimes a record of failure. The actual classroom work in some normal schools is, outside of their training schools, but little better than that

of high schools or colleges. The teacher recites most of the time. Pupils are nagged and growled at in pretty much the same old way. In many classes pupils are passive recipients rather than active participants. The science and art of questioning is wholly disregarded. May not the high schools retort to our strictures that they are greatly handicapped by the poor instruction given by normal-school graduates in the elementary school? A further inquiry into the question: How may normal-school faculties improve the quality of their teaching? may properly supplement this report.

DISCUSSION

John H. Phillips, superintendent of schools, Birmingham, Ala.—The chief function of the high school in our educational system is to provide such facilities as shall enable the pupil to discover himself. When the pupil enters the high school, he is unknown to himself, his teachers, and his parents. His tastes and aptitudes, his purposes and aspirations are to be developed by the instruction and environment of the school. At what stage in the course a pupil is expected to determine his future work, or when the process of differentiation in the interest of those desiring normal-school training should begin, is not quite clear. In some of our smaller high schools, it may be seriously questioned whether there is not already more differentiation, resulting in diversity, than economy and efficiency will justify. What is chiefly needed in the teacher is a solid academic foundation for professional work, coupled with the power of translating thought into action.

The graduates of normal schools who become teachers in our elementary schools may be readily divided into two groups: First, those who have graduated from a good high school prior to their entrance upon a professional course in a normal school, and second, those who have received both their academic and professional training in the normal schools. It seems to me that a comparison of these two groups in practical school work may be helpful; it will enable us by observation and experiment to ascertain the results of high-school training when that training is controlled by the normal-school ideal, and to compare these results with those of the regular high-school course conducted without specific regard for the normal school. In such a comparison, however, we must not overlook the diversity of conditions in different sections of the country. There are normal schools that do not require for admission or graduation the equivalent of a standard high-school course, while there are others whose curricula place them upon the level of the college or university.

In the first place, we should compare the two groups as to breadth and accuracy of scholarship. The academic work of some of our normal schools is apt to be narrowed to the requirements of the state examination, and the demand for the immediately practical is apt to forestall the necessary breadth of scholarship. We still have too many normal schools of this class, where an attenuated professional structure is attempted upon an inadequate academic foundation. In the next place, it is pertinent to inquire which of these two groups, upon the whole, is found to be more flexible and adjustable to the varying conditions of the schoolroom. The former group has the advantage, in the majority of instances, of having passed thru the grades, and their ability to cope with questions of class management is apt to be superior. The so-called model school of the average normal school is an entirely different thing from an actual public school, and fails to provide the conditions necessary for the development of initiative and executive power, which will be required in the average rural or urban school.

The danger incurred by the special preparation for the normal school in the high school is twofold: it necessitates the selection of a vocation and consequent differentiation

in work at too early a stage, before the pupil has had adequate opportunity for self-discovery; it further tends to narrow the academic work of the pupil to those studies deemed of practical use in the vocation selected. These objections apply equally to special preparation for the law school, the medical school, or any other school requiring scholarship and culture as a basis for technical and professional training.

The work of the high school in its preparation of the pupil, whether for the normal school or for any other professional school, should unquestionably emphasize the topics outlined in the paper. In addition to these, our high schools, as well as our normal schools, should provide more specific ethical training than that now afforded. Perhaps the chief weakness in the average teacher is inability to utilize the lessons and incidents of the school for the purpose of ethical instruction, and for the development of sound morality in school and community life.

J. A. SHAWAN, superintendent of schools, Columbus, Ohio.—There are three elements of supreme importance in the qualifications of a good teacher: personality, scholarship, and capacity for growth. The normal school should take knowledge of the first and aim to develop the other two. It has been said here today that many a child decides to become a teacher while in the lowest grades because of the strong personality of the teacher and a desire to imitate her in life-work. No doubt this is true, and if that desire remains, it is proof that fair teaching has been done in the upper grades as well as in the lower ones. As young people are ready to choose their life-work, how important it is that a thoroly sympathetic and wise teacher act as a vocational adviser. This is the high-school teacher's opportunity. In the absence of personality and an indication of right ideals, industrious habits, and capacity for growth, no one should be advised to enter a normal school as a preparation for the teaching profession. The right spirit and a deep interest in the welfare of others is vital. To illustrate:

Some time ago I attended an entertainment given to parents by the pupils of a certain school. As a part of the program, a young lady, a member of the school, played a solo on the piano with rare skill and musical feeling. During the exercise two teachers of the school were engaged in conversation, much to the annoyance of those about them. Their excuse was that they could not understand the music and so were not interested. They failed to realize what should be the attitude of the true teacher: first, an appreciation of an ability on the part of one of the pupils of the school to do a piece of work which they could not do; and, second, really a spirit of prayer for the success of that work.

While signing the report of the committee and believing in its point as a whole, I wish to express my own preference for a full four years' course in Latin rather than a division of time between that and some other language. Say what you will, the classics give the most dependable foundation for culture and literary taste and enjoyment. Besides that, Latin affords a good training-ground for mental discipline. Such work cannot be well done without giving a splendid basis for sound scholarship, one of the very important elements of a strong teacher.

The normal school itself should mainly inspire. It should give a new vision as well as professional training. It should in no sense attempt to complete one's education, but should give a broader view and create an abiding appetite for more knowledge. Under such conditions, the capacity for growth should manifest itself. A student—a graduate, rather—who goes out believing that his education is complete is certainly a ripe scholar and ready to be plucked. There is little chance of further growth in such cases. If the normal school enlarges the vision of its students and inspires in them a love for study and investigation, it does well. Such a result is more to be desired than the self-complacency that often comes with the accumulation of knowledge merely.

HOMER H. SEERLEY, president of Iowa State Teachers College, Cedar Falls, Iowa.—If a special preparation were able to be assured for such high-school graduates as decided

to enter normal schools, their training to be efficient teachers could be accomplished in a shorter time.

This proposition has the hearty indorsement of all those who are students and teachers in normal schools. To them it looks not only desirable but essential. Perhaps a little investigation of what the transfer from high school to normal school must bring to the student is not a waste of the time of this Council.

One of the losses that most students are compelled to experience is due to the very unsatisfactory union that commonly exists between the Senior year of the high-school course and the Freshman year of the college course. Time is a large factor in making an education thoro and serviceable, but time spent in the struggle to make a successful connection between the secondary school and the higher schools is just so much time wasted. For some years there have been teachers' associations, made up of college and high-school representatives, which have held annual meetings endeavoring to bring about a more satisfactory relationship of these classes of schools for the benefit of high-school pupils who intend to become college students. Despite these efforts, this relationship still remains unsettled, being one of name rather than one of fact.

The high schools properly say that the preparation of pupils for college is not their sole function and that in addition they cannot be sure to satisfy the variable college demands even if they make fitting for college their sole function. Many colleges prove by their annual reports that their academies are the secondary schools from which the greater number of their satisfactory college Freshmen come. They assert that it is necessary for them to maintain these academies in order to prepare the larger number of those who take the full college course if their time is to be properly conserved.

Since this statement is no doubt true to a certain extent as regards general education, it would be doubly difficult for the high schools to comply with the limitations and the standards that normal schools might endeavor to establish as regards special education. As a matter of course, normal schools would be obliged to require extraordinary preparation in the scholarship of the elementary branches of the course of study, a degree of excellence and of thoroness in this respect that is not necessarily required by those who leave the high school for college or for vocational undertakings. The experience of the normal school in preparing its own lower-grade students for Freshman studies is therefore more satisfactory as a whole than is the plan of depending upon the high schools for such material. The students in the normal preparatory courses may be lacking in social culture and acquaintance with the world, but they are commonly more mature in age and more willing to conform to demands, they are more ambitious to attain accuracy and full mastery, and they are influenced more by the occupational spirit, than are the young students from the high schools who have been making school-going their occupation and have become inured to the tedium and the fatigue that continuous school work produces. Hence lack of responsiveness and resistance to demands is frequently a decided disappointment to the normal-school professors who deal with high-school graduates.

It therefore seems probable that this notion of a system of schools so organized as to lead the pupils from one grade to another by imperceptible stages from the kindergarten to the college is more theoretical than practical, as its very continuity wears out the persistence, dulls the interest, and eliminates the spirit of application and energy. The pupil can get too much of even a good thing, and the dissatisfaction that is constantly heard with the preparation and the efficiency of the Freshman is largely a consequence of his being overtrained and overtaught, overinstructed and oversupervised. He is lacking in spirit, he is deprived of his enthusiasm, he is depleted in his independence, and he is exhausted in his resources by the demands and the requirements of the system.

Now the normal school could demand the impossible of the high-school graduate. It could expect from him what he may never have had, enthusiasm; it can urge him to display what his training has eradicated, confidence in the wisdom of the professor; it can insist upon what his tastes reject, decided thoroness in everything; it can imply that

he is possessed of capabilities that were never developed, the power to study alone and reflect upon his information—the capabilities that only mature men can show. Hence normal schools find shortcomings everywhere; they are able to ascertain deficiencies in much that he does that they think he has had; they are amazed at his inability to do all the things that their own academic students can easily demonstrate.

It is enough to say that it is not so much a different teaching and training that is wanted in the high school as it is a different measurement of accomplishment and a different treatment and management upon the part of the normal-school professors. There is much room for readjustment, for review of principles, for reconsideration of things that are fundamental, for sympathy with incompleteness and imperfection, as all these conditions will be found in the average high-school graduate. In fact, the wonder is that, in the change of environment which comes from the new standpoint and from the modification of object and purpose, the high-school graduate succeeds as well as he does when undertaking the class work and the organized plans of the average normal school.

Then there is another supreme difficulty when viewed from a nation-wide standpoint. Normal schools cannot be standardized as educational institutions, because they are provincial and statutory in their status and in their scope of endeavor. There are at least four classes of state normal schools, when their courses and plans of training are investigated. This diversity of standard complicates the situation and prevents definite conclusions. From the Upper Mississippi Valley standpoint the preliminary report is quite generally approved. From other standpoints there will be much chance for difference of opinion.

J. Stanley Brown, principal of Township High School, Joliet, Ill.—It is my judgment that it is both unfair and unwise for either the normal school or the college to dictate to the high school what subjects shall appear in the course of study, what place they shall have in the course of study, or in what quantity they shall appear. I believe the high school ought to be as largely autonomous as the elementary school or as any other school, and that its supreme purpose ought to be, and in a large measure is, the interpretation of life in terms of the community's highest need. I do not believe that the higher institutions of learning are today in any considerable degree dictating either the course of study or the supply of the teachers to the high school. What is true in this respect today was not true ten years ago.

The growth of the modern high school, its place in the community, and its importance as an institution in itself have given it such a unique place in education that it ill becomes any other educational institution to interfere with it, to hedge it round-about, or to make inroads upon its especial field of activity. It is supported entirely by taxation; in many places by local taxation, and therefore the decision of the questions, "What shall it teach?" "How much shall it teach?" and, "To whom shall it be taught?" resides in the community whose institution it is, and not in any external organization that might wish to use it for some ambitious purpose.

I see no good reason why we should not have the same relation existing between the elementary school and the high school, the high school and any other institution doing work beyond it. It is by no means demonstrable that one subject will produce the same effect as another subject, or that one subject will produce the same effect when taught to two or more different students. It is therefore clear that while we may have academic notions supporting the view that English, mathematics, science, history, and foreign language constitute the best preparation for one looking forward to normal-school training, we have also large numbers of examples of teachers who are doing excellent work and are enthusiastic over that work, but have not followed this specific group of studies. For this reason we recur to our former statement that it is better that the elementary school work out its own problems in its own way, with no specific notion of fitting for high school, and that in like manner the high school should work out its own problems peculiar to the

community in which it happens to be situated and with no specific intention of fitting for an institution beyond the high school.

The function of any public high school is to interpret life in terms of the needs of the local community whose it is, by whom it came into being, and for whose supreme service it exists. It cannot, therefore, change its aim in order to satisfy the wishes of any other institution.

The normal school must not set itself up as the one institution to which the high school must bend its every energy in an effort to supply the kind and type of individual that the normal school thinks best for its own development.

It has been asserted that the high-school teacher lacks vital teaching power because of the desiccated atmosphere supplied willingly or unwillingly by the colleges or universities. That this is true in very rare cases, we must admit. That it is also true among normal-school teachers in larger numbers, we as willingly assert.

The conditions in a high school which make for vitalizing teaching are naturally better than they are in a normal school with a single purpose, because in the former institution there must always be a great effort to reach out into a dozen lines of possible activity rather than into a single line. Hence, the stimulation must come from a dozen different sources rather than from a single source.

It has been charged that the high school has a tendency to depreciate student activities not directly fitting for college. Our observation and experience is that a large measure of sympathetic encouragement is given to all kinds of legitimate student activities, including music organizations, athletic organizations, debating clubs, dramatic clubs, etc., and that such subjects as domestic science, commercial branches, manual training, arts and crafts, etc., are as carefully supervised as any other subjects in school, and that the high school is anxious to serve the community in whose behalf these newer courses have been established. It is not difficult to find high schools that are so closely related to the community that credit has been legitimately given in instrumental music work largely or entirely taken outside of school, and for certain other courses taken independently of the school itself. These courses, so taken, are checked up according to the school's unit of measurement and are credited toward graduation in the same way as any other subject.

In conclusion, let me say, the supreme purpose of the high school is to serve, not primarily the normal school or the college or the university or the professional school, but the community in which it is located and by whom it is supported, and therefore we think that it is the business of any other institution beyond the high school to accept the product of the high school recommended by the high school, and to treat that product in the same sympathetic way in which the high school treats the boys and girls coming to it from the schools below.

CHARLES S. CHAPIN, principal of State Normal School, Montclair, N.J.—I disagree with Dr. Felmley's report *in toto*. He has two main propositions, neither of which applies to normal-school conditions in the East.

1. He seems to me to disparage scholarship, or, at least, to draw too sharp a distinction between the scholar and the teacher. I do not share his sneer at college degrees, nor his strictures on high-school teachers and teaching, nor his implied contempt for college and university men. Of course, a scholar who cannot teach is as much out of place in a normal school or in any other school as a born teacher who has no background of advanced study. No such alternative need be considered. It is quite possible to secure Ph.D.'s who can teach, and, other things being equal, they should be preferred over men of too slender academic preparation. The standing reproach on normal schools has been and is the lack of scholarly attainments of the members of their faculties. For my part, I shall always demand a degree or the full equivalent, combined with proved teaching power, as a prerequisite to appointment on the faculty of the Montclair State Normal School. The conflict between scholarship and teaching ability is largely fictitious

and artificial, and it does not become us of the normal schools to allow this report to place us in a false position on so vital a matter as scholarship.

2. The committee's report calls for *special* high-school preparation for admission to the normal schools. One of the features of this special preparation is, if I heard the chairman correctly, the elimination of the present culture studies from the last two years of the high-school course, and the substitution of a review of the common-school subjects.

I dissent from this proposition even more emphatically than from the first.

This report discloses conditions with which we in New Jersey are not familiar. Dr. Felmley says that the great majority of his students come from small country high schools. Eighty per cent of our students come from city or good suburban high schools. Our courses are standardized by the State Board of Education. We need no such special course as this report calls for. Such a course will give our pupils poorer preparation than they are getting now. We don't want the Latin, literature, science, history, and the rest cut from the last two years of the high school in favor of arithmetic, United States history, and geography. I might make an exception in the matter of geography, if it were of the right sort, but Dr. Felmley's proposition would give us a distinctly narrower class of pupils than now.

A candidate for the normal school should bring to its doors at least the following minimum of preparation:

(1) The habit of speaking and writing good English.
(2) Some knowledge and appreciation of good literature.
(3) An elementary acquaintance with the history of England and modern history.
(4) The ability to read at least one foreign language.
(5) Such a knowledge of natural phenomena as may be gained from laboratory courses in two sciences.
(6) The ability to draw from the object.
(7) The ability to read music.
(8) A knowledge of the elements of plane geometry.

My point is that this schedule of subjects corresponds exactly to the general or English or scientific courses of our New Jersey high schools, and we are entirely satisfied when our candidates have completed such a general course satisfactorily. My chief criticism on some of our high schools is directed, not at the course of study, but at the apparently low standards of grading, promotion, and graduation. The only special feature I would ask in preparation is that the candidates for the normal school review the common-school branches in the last half of their Senior year in the high school. My position disposes of all the difficulties that seem to inhere in the postponement of one's intention to enter the normal school. The candidate prepared in our high schools, not *specially*, as this report suggests, but without reference to her destination in life, may enter our normal schools on opening day without examination. I am detailing the actual practice of admission to the New Jersey normal schools.

3. I dissent also from the idea expressed in the report, that the normal schools shall dictate the course of study in the high school. We of the normal schools are self-governing, taking our orders from no higher institution. It is not only just, but it is very good policy, to respect the autonomy of the high schools. I shall be entirely satisfied if they will teach well any of the courses they are now offering, and shall be glad to take any of their graduates thus prepared, provided they have the personality of the born teacher. If the high-school people will discourage the temperamentally unfit from coming to the normal school and will send only those who are likely to become good teachers, they may prepare them in any course of study that includes all or most of the subjects I have enumerated.

D. B. PARKINSON, president of Southern Illinois State Normal University, Carbondale, Ill.—1. Exhaustive report of committee of great value to the cause of education.

2. Of great value to the normal school. Enables us to see the place of the normal

school in the scheme of education. The normal schools are not rated as they deserve. As professional schools they deserve to be placed in the class of colleges, or by themselves, at least not with the secondary schools.

3. But a small percentage of high-school graduates enter college. A larger percentage would enter the normal if all the states were as liberal toward her graduates from the state normal schools as the state in which this meeting is held. When this is done there will be a larger attendance upon our normal schools from the high schools. And then the prospective teacher will appreciate a course in his high school that will at once articulate with his normal-school work.

4. I suggest a thoro review in the common branches in the last year of the high-school course which shall prepare them for the special methods in these branches.

5. I suggest further that the same plan would apply with equal force to the subjects of drawing, vocal music, and perhaps some other studies, depending more or less on local conditions and demands.

6. I do not suggest at this time what subjects now in the high-school course should be displaced by those mentioned. This would be a matter of detail and could easily be worked out after determining that something of this kind should be done.

7. I recommend further that the high school find some magic wand by which her products grow into a more rational and serious attitude of mind toward the higher ideals of life. While many are ambitious as to the possession of ideas, too many are indifferent as to the higher ideals. If this change of heart could be experienced before entering the normal school a large amount of energy exerted there could be diverted into a much more desirable channel.

HEALTH PROBLEMS IN EDUCATION

THOMAS D. WOOD, M.D., COLUMBIA UNIVERSITY, NEW YORK, N.Y.

The most important of all our national resources is the health of the people. The most valuable asset in this capital of national vitality is the health of the children.

Public education is the logical, the strategic, and the responsible agency of the nation, of each state and each community, for the conservation and enhancement of the health of the children.

To become an effective instrument for the protection and promotion of child health, it is essential not only that the school should be a sanitary and healthful place for children, but that various agencies in public education should be so organized that each pupil may be given the best possible opportunity to escape disease, and far more, to attain in each individual the reasonable best in growth; in development of biologic, intellectual, moral, social, and economic power.

What may the child be allowed to accept in exchange for any actual or vital part of his health? How shall public education account for its stewardship if thru ignorance, neglect, or unwisdom any child fails of any essential health value, directly or indirectly necessary to insure the future well-being which the school might have secured for the individual?

It cannot be taken for granted that school children are healthy. The majority of them are not so healthy as they should or may be.

There are in the schools of the United States today approximately

20,000,000 pupils. Careful study of statistics and estimation of all conditions lead to the following personal conclusions:

From (1½–2 per cent) 300,000–400,000 of these have organic heart disease.

Probably (5 per cent) 1,000,000 at least have now, or have had, tuberculous disease of the lungs.

About (5 per cent) 1,000,000 have spinal curvature, flat-foot, or some other moderate deformity serious enough to interfere to some degree with health.

Over (5 per cent) 1,000,000 have defective hearing.

About (25 per cent) 5,000,000 have defective vision.

About (25 per cent) 5,000,000 are suffering from malnutrition, in many cases due in part, at least, to one or more of the other defects enumerated.

Over (30 per cent) 6,000,000 have enlarged tonsils, adenoids, or enlarged cervical glands which need attention.

Over (50 per cent) 10,000,000 (in some schools as high as 98 per cent) have defective teeth which are potentially if not actually detrimental to health.

Several millions of the children possess each two or more of the handicapping defects.

About (75 per cent) 15,000,000 of the school children in this country need attention today for physical defects which are partially or completely remediable.

Pupils need, and are unconsciously calling for, adequate care. Parents are demanding with rapidly increasing conviction and emphasis the service which public education can alone or most advantageously give in relation to child health. Teachers are consciously inadequate to this task of health care but are awakening to their responsibility in relation to it.

Physicians are, as a rule, too much occupied with the study and treatment of disease; they have too little time for, and too little inclination toward, the field of preventive medicine; toward the field of child hygiene; toward the field where medicine and education, with a constructive program of educational hygiene, or better, hygienic education, may insure to the growing child the realization of the best of his heritage, the correction of all remediable weaknesses and defects, and the attainment of a quality and fullness of life which shall put the human being on a par with the choicest flowers and fruits, the best of the valuable creatures so carefully and skillfully cultivated by man.

For while the human creature has, in part, a different destiny from and higher capacities than those of other animals and all other living things, still many conditions of his life are precisely or closely like those of the lower and higher forms of animate beings. Yet the human plant, the human flower and fruit, receives less adequate care relatively of the fundamental, biological life and health conditions than any other life species of particular value to mankind.

Of the values and attainments dependent upon physical and health care, the human being realizes less relatively than any other organic species cultivated by man.

Quite apart from the benefits of eugenics, we have little idea as yet of the possibilities of humanity conditioned upon a rational, complete, and constructive hygiene.

If it were possible to estimate accurately the gain to the race and to the nation in one generation by practicable care of child health—in preventable mortality and morbidity, in escape from helplessness and hopelessness, in improvement of physical, intellectual, and moral worth; in economic and industrial efficiency; in social and civic power; in human satisfaction and happiness, our country would be startled by one of the most stupendous facts in human history, and energized into one of the most telling educational reforms that the world has ever seen. In fact, it seems altogether probable that we are today in the beginning of this constructive health epoch. The country is coming rapidly to recognition of the importance of this broader humanistic responsibility of education.

Spasmodic, nobly intentioned efforts are being made all over this country to improve foundations of education, to correct physical weakness of child life. We have a variety of laws in a number of states providing for elements of supervision and care of child health. Some of these laws are permissive. Some are mandatory. Some are largely aimed at the correction of disease and defects. One or two are wisely and progressively constructive in plan, providing for a care of child health and development which will, if realized, do much to make human education a genuinely successful process.

There are about one hundred cities in our country, having about one hundred types of organization for medical inspection and health care of school pupils. None of the city systems which has been described in print seems satisfactory as a model for the country to follow unless it is that type in the city which entertains this convention. At least, St. Louis presents a department admirably planned and balanced in many essential elements.

The Wiesbaden system of medical inspection in Germany stands out as a pioneer model, which perhaps is still unsurpassed in the admirable composition of elements and in the remarkable spirit which has made that city organization so worthily influential as an example in Germany as well as in other countries, including our own.

Noteworthy features in the Wiesbaden system are:

1. The means for securing the co-operation and sympathy of parents and teachers.
2. The completeness of the examination of each pupil.
3. The frequency and regularity of the examination, coming at vital stages of the child's school life.
4. The filing of the health report, a school record, used for reference in connection with the school work of the child.
5. The scientific and educational interest of the doctors which insures thoro examinations and wins co-operation of teacher and parent.
6. The popular nature of the movement as it has developed among the people and has not been imposed by a control government.
7. The movement is an integral part of the school system and is treated primarily as an educational problem.

Some of the practical direct and indirect results of the Wiesbaden system may be stated thus:

1. Children of subnormal type are profitably delayed in entering school.
2. Individual children are made happier and more efficient.
3. Teachers are relieved by special individual adjustment of the weaker children.

To the movement can be traced:

a) The forming of special classes for defectives requiring modified treatment.
b) Installation of school baths.
c) Providing free meals for school children.
d) Establishment of free clinics and dispensaries for treatment of child ailments.
e) Founding of outdoor schools for weaker children.

The system is defended on economic grounds as an effective means of preserving and improving social and national efficiency. The spirit in which the personal supervision of the child's health in school should be conducted is well expressed in the following statement, written in characterization of the Wiesbaden organization:

> The new education is indeed more personal but it is more reverent and gentle than the old. Rudeness will wreck all. The human body is not vile. It is the instrument of instruments. The first condition of success is not that the doctor has degrees, it is that he should not offend one of these little ones. The behavior of children—that is not a thing to judge in the first place. To judge is easy, it has been done for ages; to understand is the new task begun very late. Hasty judgment precludes the possibility of complete understanding. To classify according to health is comparatively easy, it may be done by the three-card system. To classify ability and weakness is not so easy. Each child presents his own problems.

We lack today clearly established principles and ideals relating to the health responsibility and health problems of education. We lack reasonable uniformity of standards with reference to scope of work to be done; with reference to relative importance of different aspects of the health field; with reference to division of practical service in the health field between teachers, principals, schools, nurses, school doctors, teachers of hygiene and physical education, and other special teachers and school officers. We lack desirable uniformity of standards regarding localization of responsibility and authority for health supervision of school children; of forms of co-operation of educational and health boards; of details of co-operation between school and social or philanthropic organizations. We lack clear definition and realization of possible co-operation between school and home affecting the health and general welfare of the child. This last is most important, inasmuch as this educational supervision of child health, if carried out as it may be without weakening or impoverishing the home in any way, promises to be, and in some actual practice proves to be, the most natural and effective introductory bond between home and school, providing a basis for vital elements of sympathetic co-operative effort, affecting as well the mental and moral well-being of the child. We lack in this country the inspiration and guidance of a national pronouncement on this subject which shall give assistance somewhat commensurate with certain very telling statements contained in the English Education Act, passed by Parliament in 1907. In this we find the following:

This new legislation aims . . . . at the physical improvement and, as a natural corollary, the mental and moral improvement of coming generations. It is founded on a recognition of the close connection which exists between the physical and mental conditions of the children and the whole process of education. It recognizes the importance of a satisfactory environment, physical and educational, and, by bringing into greater prominence the effect of environment upon the personality of the individual child, seeks to secure ultimately for every child, normal or defective, conditions of life compatible with that full and effective development of its organic functions, its special senses, and its mental powers which constitute a true education.

This memorandum also states that the work of medical inspection cannot be properly accomplished unless

t h e teacher, the school nurse (where such exists), and the parents or guardians of the child co-operate heartily with the school medical officer.

What may the National Education Association do thru the National Council of Education to further the interests of this health cause?

It seems desirable that after careful study of the field cogent recommendations should be formulated which may furnish definite guidance to states, cities, and rural districts concerning the best practical measures, methods, and forms of organization for accomplishment of work under all the varying conditions in the health field.

We need new types of educators, physicians, nurses, and parents with more comprehensive and thoro training to provide the requisite care and supervision of childhood with full regard to the preservation and enhancement of health in relation to the even more important faculties and values to be developed in the lives of the young.

Fathers and mothers need to become wise in knowledge of child nature and more skilled in the art of parentcraft which may help the child to realize the best of his possibilities on a sound and cultivated biologic basis.

Superintendents and principals of schools must see clearly thru and around this health field if they are to have true estimation of relative values and are able to meet their varied obligations in relation to parents, teachers, pupils, as well as to boards of education, and other official bodies who determine the sanction and financial support which are necessary for the practical conduct of the work.

Physicians require for this field of educational hygiene, not only medical training and skill, but understanding of educational principles and methods, with keen insight and sound judgment which will enable the school doctor to acquire thoro understanding of the child and to help make the school a healthful place for the pupil, and at the same time to help adjust the individual most successfully to the educational process.

We need more convincing demonstration of the value of various measures and methods employed for the promotion of child health, so that sufficient money may be appropriated for school hygiene by those who control the public funds.

Educational hygiene includes much more than health examinations for contagious disease and chronic physical defects, altho such examinations make the basis for all effective care and adjustment.

Other factors of essential importance in the health field are the following:

a) Maintenance of sanitary, healthful school environment with clean schoolhouses; abundant light, good air, etc.

b) Hygienic instruction and school management, with particular attention to influence of teacher upon nervous health of pupils.

c) Effective teaching of health and hygiene to all pupils in the schools.

d) Rational supervision and direction of play, games, athletics, and all healthful and satisfying forms of physical education.

Special features in the schools, or closely related to the schools, which have direct bearing on health include the following:

a) Homes of the pupils.

b) Playgrounds and gymnasiums.

c) Dental clinics and other medical clinics for children.

d) Classes for defectives and cripples.

e) Open-air schools.

Improvement in school hygiene involves prominently these factors:

1. Recognition of extraordinary value of work of school nurses, and employment of nurses in the schools.

2. More comprehensive and thoro training in school hygiene in all normal schools and other institutions for professional education of teachers.

3. Better technical training for school physicians, school nurses, teachers of hygiene and physical education, and other special officers in this field.

4. Requirements of tests of knowledge and skill in various phases of school hygiene for teachers in general, and certification of health specialists of different types.

THE SCHOOL'S RESPONSIBILITY FOR PROVIDING HEALTHFUL ENVIRONMENT AND PROGRAM

R. W. CORWIN, M.D., CHAIRMAN OF COMMITTEE OF AMERICAN MEDICAL ASSOCIATION ON HEALTH AND PUBLIC INSTRUCTION, PUEBLO, COLO.

I have nearly worn out a copy of Dr. Wood's Ninth Yearbook, in preparing this talk, yet I shall not hold him responsible for what I say. You have all read this book. He has told my story, and better than it is possible for me to do. In fact there is no reason to call your attention to these matters. But some of your teachers are not so fortunate as yourselves, they have not had time or opportunity to investigate or to give health sciences much thought. For this reason we ask permission to offer our assistance. The responsibility of the school falls not alone upon the superintendent, but as well upon all the teachers, the school board, and the laity. Without taking further time to explain why I am here, I beg to say: The object of the public school is to improve the human race physically, develop it

mentally, and strengthen it socially and morally. The public school fails in proportion to its inability to meet these obligations. Health occupies the first attention of the school's responsibility. Killing education is waste of time, money, and human tissue. Healthful environment is the foundation of education, and program the superstructure.

The school's responsibility for providing for the health of the school-young is of paramount importance, both to the child and to the public. Let us review some of the more important features:

There is the responsibility of selecting the site for a building in a large city, where the ground is expensive, where there is smoke, dirt, noise, little sunlight and pure air; limited playground; no trees, flowers, or grass; where the building must be of many rooms and floors, and where a large number of children congregate in a small area; or in the country, where swamp and malaria, wind, cold, snow, rain, dust, hot sun, and bad roads demand attention.

There is also the responsibility of selecting teachers; of the health of children from five to twenty years of age; of detecting and correcting mental and physical defects; of overcoming bad heredity, and evil home and social environment; of providing for the underfed and poorly clad, and suggesting to the overfed and richly clothed; of physical examination and physical training; of school nursing and quarantining; of sanitation in the building and about the grounds; of educating the young in health sciences; of—and not least—educating the parents and friends, overcoming prejudices, and obtaining their co-operation.

To review just a little more in detail:

The principles of ventilation, heating, lighting, and plumbing are too well understood to need reviewing, but there are many minor points of importance that are often overlooked and may not be out of place to mention at this time. For instance: the height of rooms—too great to be well or easily ventilated, heated, or lighted, to say nothing of increased cost of construction; dust-catching projections above doors, windows, blackboards, wainscoting, and picture molding—all unsanitary, and difficult and expensive to clean; square corners hard to clean; wainscoting and floor cracks impossible to clean; ornate capitals never cleaned; balustrades with all sorts of ridiculous projections that hold dust and germs; curtains and window-shades always dusty and dirty; doors that slam and annoy; wall colorings that psychologically irritate; halls that reverberate sounds, and disturb; machinery that is noisy; domestic science departments which emit offensive odors; and chemical laboratories, dangerous on account of fire, which generate disagreeable gases. These three departments should not be in the building with the rest of the school.

May I take the liberty of here presenting a plan of school buildings, tried and found worthy? [Here was introduced plan of model schoolhouse and incline.]

While the exterior of the building should be architecturally attractive, and educational, it is the interior that should be given the deepest study. Too many think much of the looks and not enough of the use of the school building. The superintendent is not to be criticized, but the school board, real estate men, and patrons, full of civic pride. My attention was called to a massive stone building in a hot climate. The person said, "All you need here is a floor and a roof." It is the size of the pile of brick and stone that too often is given first attention.

I know how you gentlemen have to fight us members of the board and thoughtless outsiders. I am sure if you could have your way, many would have every girl and boy study out of doors and use the schoolhouse only when it rains. The laity forgets the lesson of the Black Hole of Calcutta; they do not stop to think why sleeping out of doors is being so universally advocated; they have not learned that it is not only the presence of CO_2 and the absence of oxygen that poisons, but as well organic matter brought into the room by forty to fifty pupils. They have no idea that one catches cold in a badly ventilated, dry, and close room more easily than in a cold room, or out of doors; they have never heard the statement that somebody has made, "that a person may go three weeks without food, three days without water, but only three minutes without air"; that bad air kills 40 per cent of the people, and perhaps is largely responsible for the illness of the other 60 per cent; that 20 per cent more teachers die of tuberculosis than workers in other occupations. They have not studied the lessons given us by the Japanese and Panama sanitarians. We shut out the cheapest thing on earth—fresh air—and what little we permit to enter our rooms we cook to death, if possible.

Just a word about the drinking-cup which has gone, we hope, forever. A saturated solution of boric acid with $\frac{1}{2}$ to 1 per cent formalin was placed in a jar; a glass with *Staphylococcus albus* upon it, immersed in the solution eighteen minutes; the viability of the germs was then tested—they grew and thrived. The drinking-cup may be used by the teacher for illustration.

Hygiene of instruction or program covers a broad field. It deals with knowledge and care of the pupils at all ages and under all conditions; how to instruct and what instructions should be given that pupils may know how to protect themselves and care for others. But first the teacher must be considered as to health, preparation, and duties. No sick or half-sick teacher can do good work. Every teacher should have a pretty thoro course in all the principal branches of health sciences. No teacher in any department should be employed who has not had a course in health sciences. Every teachers' school should give a course in health sciences. The duties of a teacher extend outside of the school; to the parents it pays to devote this time.

New discoveries are being made every day. To keep up, teachers must study all the time. There are four ways in which one may keep up in this work:

1. Postgraduate work, which many teachers take at a sacrifice of time, money, and vacation.
2. To take bulletins prepared by specialists. This is feasible.
3. By attending lectures of specialists sent out from a central bureau.
4. By lantern slides and moving pictures prepared by a central bureau.

In every school there should be someone prepared to teach health sciences. The object of the school is to teach. The most important thing to teach is the principles of health, or a course in health sciences. The health of the pupil must always be considered and protected. Today it is very fashionable, and justly so, to criticize child labor. How often do we see children who enter school in the fall with rosy cheeks and full of energy depart in the spring pale and languid. What is the matter? Something is wrong. Is it poor ventilation? Is it too much work? Too long hours? (The faithful student works from ten to twelve hours a day—more than is demanded of a laborer.) Is thinking too hard work? (A servant girl said she wanted $15 per month if she did not have to think, but $25 if she had to think.) Is our method of teaching wrong?

In teaching health sciences, the following are of vital importance to consider:

1. Prophylaxis or prevention.
2. Resistance—the strength of the individual—his ability to throw off disease.
3. That ignorance is the most common cause of disease.
4. That someone is to blame for ill-health.
5. That "1,600 people die in the United States every day who should live."

That "1,000,000 people in the United States are sick every day who should be well."

That "sickness costs the United States annually one and a half million dollars."

That "within the next year, 600,000 people in the United States will die, all of which deaths might be prevented," and which is not the case in other countries where better sanitation is observed.

Then, is not the duty of the school evident? Is it not our duty to teach students how they may protect themselves against disease?

To learn how to protect ourselves against disease is more important than many things that are learned in school. There is much that the student learns which he soon forgets, but he cannot forget health, which is with him all the time, especially if it be bad health. Are we not our brother's keeper? That question was answered centuries ago. The question is the same today and we know the answer. Is not the responsibility of the school plain?

DISCUSSION

Albert E. Winship, editor *New England Journal of Education*, Boston, Mass.—One state department in California sent to the Imperial Valley at one time 30,000,000 ladybugs to deal with the pest scale that is attacking the apricot trees. This was only one installment for one pest, for one variety of trees in one section of one state.

The cry for help comes from every nook and corner of the land for state governments, state agricultural colleges, state universities, and the United States Department of Agri-

culture to find relief from the pests and diseases affecting plants and animals of various kinds. The appeal seems universal, but the minute that the remedy affects any person or any community adversely commercially, even transiently, the opposition is much more noisy than the friends. This has been specially noticeable in the case of milk legislation and inspection.

The health of children is the last to receive attention. We now know how to save the lives of half the infants who would otherwise die in the first year, how to eliminate much of the absence from school caused by illness, how to prevent much of the retardation in school, and how to increase greatly the efficiency of many pupils in school.

Few things in all modern life have equaled the benefit to humanity of public attention to the health of children until after the time of epidemic children's diseases is largely passed. It would seem as tho at this men and angels would rejoice.

Contrariwise all this seems simply to have stirred up the depths of the wrong class of men and the anti-angelic host.

Tuberculous cattle seem to have more ardent friends than children, and even the old-fashioned, vile milk-can dishwater has more vociferous champions than sweet babyhood. It sometimes seems as tho coffin-makers, funeral undertakers, and makers of funeral wreaths were liable to join the crusade against the self-sacrificing and devoted laborers for the health and life of children.

It is sufficiently difficult to combat the ravages of disease and the ignorance that breeds and spreads and promotes disease, but when one has to struggle also against commercial interests that thrive on disease-producing conditions it makes the problems infinitely more difficult of solution.

Wherever there is to be found a man or woman who really loves children more than any of the many commercial interests involved, we should endeavor to inspire the patriotism that leads to heroic crusading for the further solution of health problems.

J. F. Keating, superintendent of schools, Pueblo, Colo.—You seem to be skeptical as to the practicability of the cottage plan for grade schools just presented by Dr. Corwin. Let me say to you this is no mere theory, for the plan is in practical operation in Colorado and were there time I should like to discuss the plan at greater length. Come to Pueblo and we'll show you.

Just a word in regard to this whole health program. No other question before this educational meeting is of such vital importance as is this matter of the health of the school children and of the sanitary conditions of both home and school. We seem fully appreciative of this fact here tonight but this will avail little unless the agitation be kept up. To this end I suggest that either this committee be continued or another permanent committee be appointed to urge in season and out of season the necessity of caring for the health of the school children of the nation.

PRELIMINARY REPORT OF COMMITTEE ON RURAL-SCHOOL EDUCATION

E. T. FAIRCHILD, STATE SUPERINTENDENT OF PUBLIC INSTITUTIONS, TOPEKA, KANS.

The rural school is the one laggard in the educational procession. Not only has it failed to keep step in the march of educational progress, but there are those who declare that, taken as a whole, it is less efficient than it was twenty-five years ago. Many reasons may be advanced for this lack of development. However, no study of the situation will be complete that

does not recognize as a definite factor the great change that has taken place in community and social conditions. The ever-increasing trend of rural population toward the cities, and the growing percentage of tenant farmers have had a distinct and deterrent effect upon our country schools.

The educational thought of our age has been directed toward the improvement of the city-school system, the high school, the efficiency of college, normal school, and university. The best efforts of many of the wisest and most influential people of our country have constantly been devoted to the betterment of these means of higher education. And the emphasis of our thought has been placed long and devotedly on these educational agencies at the expense of our rural schools. Not only has the educational press rendered notable assistance, but the general press has contributed much to the public understanding and appreciation of educational activities as they relate to city systems and to higher education in general. The people as a whole have a very fair grasp of the importance, value, and character of the work done in this type of schools, and demonstrate their appreciation and approval by making most liberal appropriations and levies for their support.

We rejoice in the great things that have been done for higher education, but submit that the time has now come when the same generous support and the same ardent labor should be devoted to the improvement of the rural schools. Altho they serve directly the interests of the greatest percentage of our population, and tho they are admittedly the most inefficient part of our educational system, yet they are utterly lacking in that generous and unselfish support so freely given for the advancement of the high school and college.

THE RURAL SCHOOL OF TODAY

The following is a true tho not full indictment. Of the 12,000,000 rural-school children, constituting a clear majority of the whole number of the youth of school age, less than 25 per cent is completing the work of the grades. The teaching body is immature and lacks proper training. Terms are too short. School buildings are poor, unsanitary, and ill-equipped. The school enrollment is constantly decreasing. The supervision is wholly inadequate. Cost of instruction is higher than in the grades. High-school privileges are denied to the great majority of these boys and girls. The strong, virile rural school of a generation ago has gone and in its place is a primary school weak in numbers and lacking in efficiency. The country boy and girl of this strenuous and complex twentieth century are not afforded equal educational opportunities.

With this known body of fact the Committee on Rural Schools has not thought it necessary or desirable to employ its energies in seeking further details as to the weakness and insufficiency of the rural schools of today. On the contrary, it has decided wisely, it is hoped, to address itself to a study of how best to promote and to strengthen the rural-school system, and will

attempt to propose such remedial plans and legislation as will make for the most effective and the most immediate betterment of these schools. With this in view it has not undertaken to idealize, or to discuss measures that, however desirable, are not in the nature of things capable of somewhat early realization. At the first meeting of the committee held in November last in Chicago, the following list of subjects was chosen for consideration:

ORGANIZATION:

1. The Unit of School Organization.
2. Consolidation.
3. Classification (Standardization).
4. Minimum Term.

ADMINISTRATION, AS TO:

5. Funds—Their Sources and Distribution.
6. Compulsory Attendance.
7. The School Plant.
8. Libraries.
9. Supervision.
10. Records and Statistics.

INSTRUCTION:

11. Uniform Courses of Study, including gradation and a minimum number of classes.
12. Textbooks.
13. (*a*) Preliminary Preparation of Teachers.
    (*b*) Teacher-training Courses in High Schools.
14. Appointment and Tenure of Teachers.

SOCIAL ELEMENTS:

15. (*a*) Co-operation.
    (*b*) The School as a Social Center.
16. The Home and the School.
17. Organized Games and Plays.

RURAL SECONDARY EDUCATION:

18. (*a*) Free Tuition.
    (*b*) Consolidated, Township, and County High Schools.

A more detailed statement of subjects chosen for investigation and recommendation by the Committee on Rural Schools is given below:

ORGANIZATION:

1. The Unit of School Organization.—A consideration of the several units, district, township, and county, with a view to urging the general adoption of that one which affords the best results.
2. Consolidation.—A presentation of the advantages and of the imperative need of consolidation or centralization of schools from considerations of economy and efficiency.
3. Classification.—The adoption of a plan of systematic classification, or standardization, of rural schools with official recognition by the state of those schools which fulfill prescribed conditions, in the form of a moderate amount of state aid.
4. Minimum Term.—The enactment in every state of a law fixing the minimum length of the school year, with provision for state aid to those districts which without such aid would not be able to maintain school for the prescribed period.

ADMINISTRATION, AS TO:

5. Funds—Their Sources and Distribution.—A study of means of increasing school revenues, and a rational basis for the distribution of state and county school funds.

6. Compulsory Attendance.—A thoro study of the compulsory school laws of the several states, and a general investigation of means of increasing the attendance in rural schools.

7. The School Plant.—Model school grounds and buildings, and a standard equipment for rural schools.

8. Libraries.—The providing of a minimum number of suitable general and reference books in the form of permanent or traveling libraries.

9. Supervision.—

a) Closer Supervision.—The development of a plan for closer and more effective supervision, e.g., the Oregon plan, which provides for every twenty schools a supervisor under the direction of the county superintendent.

b) County Superintendents.—The system of county supervision including the qualifications, manner of selection, duties, tenure of office, and compensation of county superintendents.

c) State Rural-School Supervisors.—The need in each state of one or more rural-school supervisors, or visitors, under the direction of the state department of education.

10. Records and Statistics.—Systematic records that shall reveal real facts as to: (*a*) rural-school population; (*b*) enrollment; (*c*) average attendance; (*d*) length of term; (*e*) number of rural-school pupils completing the work of the grades; (*f*) comparative per capita cost of town and country system; (*g*) comparison per pupil of valuation of taxable property, town and country; (*h*) comparison of average mill levy in town and country; (*i*) comparison of value of school property buildings, etc., per pupil, town and country; (*j*) comparison of enrollment per teacher, town and country; (*k*) comparison of average number of school days attended in town and in country.

INSTRUCTION:

11. Uniform Courses of Study.—A provision in the several states for the preparation and compulsory use of a course of study for rural schools and suggestions as to gradation and a minimum number of classes; and in view of the general recognition of the need of a reorganization and redirection of the work of these schools, the feasibility of introducing additional vocational work, particularly in agriculture, and of providing at state or county expense special instructors therein.

12. Textbooks.—The adoption of textbooks that recognize more intimately country life and country environment.

13. (*a*) Preliminary Preparation of Teachers.—The enactment of laws providing for a more adequate preliminary training on the part of applicants for teacher's certificates.

(*b*) Teacher-training Courses in High Schools.—A system of teacher-training courses in high schools for the purpose of securing a better trained class of teachers in the rural schools.

14. Appointment and Tenure of Teachers.—The appointment, or nomination, of teachers by an educational expert, as the county superintendent, with greater permanence of tenure.

SOCIAL ELEMENTS:

15. (*a*) Co-operation.—Co-operation of social forces—the home, church, grange, farmers' institutes, extension work of colleges, papers, and magazines.
(*b*) The School as a Social Center.—The use of school buildings as centers for the various social activities of the community.

16. The Home and the School.—A close inquiry based upon the theory that the progress, discipline, qualifications, and development of the youth depend more largely upon the right kind of parental influence than upon all others combined. This may well include the question, To what extent approximately does the influence of incompetent parental supervision affect the capabilities, adaptation, discipline, and efficiency of the average pupils in our public schools? The state may provide for its boys and girls great opportunities, the acceptance of which the parent may easily prevent.

17. Organized Games and Plays.—The appropriation of play as an educational agency and the utilization of the child's instinctive interests as a means of promoting his intellectual and moral growth.

RURAL SECONDARY EDUCATION:

18. (*a*) Free Tuition.—The value of high-school training for country youth and the necessity and means of providing free high-school privileges for every eligible boy and girl.
(*b*) Consolidated, Township, and County High Schools.—The plan of instituting and maintaining consolidated, township, and county high schools; and the introduction of vocational training for preparation for country life and pursuits.

A careful study of the subjects above listed seems to justify the conclusion that we have here not only a series of vital and essential elements in the problem before us, but also a group of factors that are both practical and practicable. The various topics have been assigned to subcommittees for investigation, elaboration, and recommendation.

The subjects assigned to myself are: "Preliminary Preparation of Teachers" and "Teacher-training Courses in High Schools."

A vital weakness in our rural-school system is the lack of a genuine demand for properly trained teachers. I have knowledge of one state that bears an excellent reputation educationally where out of 8,000 rural-school teachers in 1910, 4,400 were found to have had no training beyond the eighth grade. The most constant and most imperative requisite of any plan of school instruction is an adequate supply of competent teachers. No other provisions, however ample, can be substituted successfully for capacity in this respect, nor compensate for the want of it. Not liberal appropriations, nor costly buildings, nor well-framed theories, but instruction that executes the purpose of all these, touches the mind of the scholar, and imprints thereon its own character and qualities, is the demand that must be met; and yet it is just at this point that our common schools, particularly our country schools, exhibit their greatest weakness.

First of all, then, is the need of legislation in every state providing that no one may apply for a certificate to teach in any public school who is not at least a graduate of a four-year accredited high school or its equivalent. It is a pleasure to know that this requirement obtains in several states of the Union today.

As to a teacher-training course in high schools, it is a well-known fact that a large majority of the rural teachers go into the work with little or no special preparation. Notwithstanding the multiplication of normal schools, it is rarely that a graduate of these institutions is to be found engaged in teaching in the country. It is a striking anomaly that the lawyer who looks after our material interests, or the physician who cares for our bodily health, even the veterinary who doctors our horses and dogs, the carpenter who builds our houses, or the machinist who repairs our automobiles, must go thru a long professional training or practical apprenticeship before he is regarded as fit to ply his trade. Yet every year thousands of inexperienced and untrained boys and girls are allowed—

even encouraged—to step out of the ranks of the common schools and to take their places as the counsellors and guides of the plastic minds and immortal souls of our dearest possession—our children. And this condition falls with greatest severity upon our rural population, for the school boards in all our cities and in most of our smaller towns have firmly established the rule not to employ a teacher who has not had practical teaching experience or special professional training. So the only place where the untrained tyro, with no education beyond that furnished by the eighth grade, may begin is in some country school. But the beginners must teach and the school must have teachers. As a consequence our rural schools become the only training school that the vast body of our teachers ever know; and here these teachers learn—by experience and experiment, by practicing upon the tender intellects of the most hopeful and virile youth of the land—those pedagogical principles and educational truths which they should have learned as a part of their preliminary professional training before ever entering the schoolroom "as one having authority." And even this does not tell the whole story. No sooner has one of these journeymen, or rather journeywomen, teachers by virtue of quick insight and ready acquisition—by reason of the born teacher's birthright—grasped the fundamentals of her great problem and proved herself capable in the application of them, than the superior inducements of the graded school and the ever-alert city school board allure her from the country to the town. And the rural school must begin over again the training of another teacher to go the same way; or, it may be, this time to experiment with one who was intended to have been a hewer of wood and a drawer of water instead of a teacher of men.

The only relief lies in requiring better preparation and some professional training for all our teachers. It seems clear that it will be many years before the normal schools, if ever, will address themselves to the problem of preparing teachers for the rural schools. The plan, therefore, of devoting the last year of a high-school course to special professional preparation for the work of teaching seems to be most desirable. In the states in which this system is in operation excellent results have followed.

But however well this committee may perform the important duties assigned to it, however wisely it may recommend, much more must be done. The country school needs assistance, it needs the help of the philanthropist and the business man, it needs the assistance of all institutions of higher learning, and the union of all social forces for its betterment.

Authority and money must be given the National Bureau of Education that it may undertake a campaign for the reorganization of the rural school.

Other agencies now devoting time and money to social uplift should be invited and urged to join in an effort to investigate thoroly rural-school conditions, to propose remedies, to direct public attention, to suggest remedial legislation.

And in addition to all this it greatly needs every possible help and assistance that can be given it by the Council of Education of the National Education Association. In short, it needs organized help if these schools are to perform their proper function.

Withal, there must be a nation-wide campaign of publicity. Public attention must be challenged and the rural communities must be aroused to the necessity of better school privileges for the children. A great trouble is the low state of public opinion, and a lack of knowledge as to actual conditions. Our efforts will be futile until we contrive ways and means to awaken the people to the magnitude and importance of this question. Of the importance, the necessity of publicity we find examples on every hand. No great enterprise is undertaken today, nor is success anticipated except thru the assistance of the press. Just as other great reforms of a social, political, or religious nature are brought about thru the widest possible discussion, so only can this great problem of assisting that vast army of country boys and girls be solved. The story is replete with human interest and involves the whole social fabric of our country's future. It is one that may well engage the earnest attention and the enthusiastic support of our best writers and speakers. What an opportunity is here offered our great magazines to champion a cause of such national and vital import! A series of articles prepared by those who write commandingly and interestingly, and printed in those publications whose readers are numbered by millions, would accomplish more in a campaign of one year than could be brought about thru ordinary means in ten years. And this alliance of the great papers and magazines can be secured thru the influence of this Council. The editors and owners are eager to undertake such a mission. Shall we not help them to find the facts and, if necessary, the writer?

Again, these schools need organized help. Recently a so-called commission of higher education met in the office of the governor of a great state to discuss ways and means by which its three state educational institutions might be rendered still more efficient. This commission was composed of the most representative men of that commonwealth. Among them were men skilled in letters, men who are experts in education, and business men who had made a brilliant success in the commercial world. Here were men, thirty in number, who for months had been devoting their energies and contributing the fruit of their experience to a consideration of means whereby these great schools might become yet more effective. The state superintendent of public instruction sat there, the only one present charged with the responsibility of daily considering the needs of that great majority of the youth who are never to have the advantage of college or university training. Is this not the situation everywhere? Where in all this broad land is there an organized body of men of the type above described devoting themselves to the task of improving the rural school? If such commissions could be formed in every state how swift, how certain

would improvement follow! The committee understands and appreciates the great progress that has been made in certain states in bettering rural-school conditions. It is aware that important surveys are being made and it rejoices. But the fact remains that there is no nation-wide movement in behalf of the country school.

Under the wise and capable administration of Commissioner Claxton the rural schools are to be helped as never before. We are earnestly hoping that some of the great foundations will add to their other activities the promotion of education in rural schools. These boards with their corps of skilled workers and their great financial resources could accomplish more than any other agency.

The problem before us is perhaps the greatest in America today. Certainly it is the greatest educational problem. It is nothing short of attempting to secure to 12,000,000 children their natural birthright—equal educational opportunity.

If we want to get more out of the rural schools we must put more into them. We can never have the best rural schools until we have aroused public interest in them. The national life and character of tomorrow is being set and directed by the schools of today. The country is the nation's great recruiting-ground. To it the city has always looked for its supply of men who do the great things: command armies, build industries, take the initiative. It is true that the cities are the centers of organization, but they are not self-sustaining. The rural population must always be the bone and sinew of any country. More than one-half of our school population is trained in the rural schools. These schools are inadequate. From every consideration, both economic and social, more careful attention should be given to our rural schools.

DISCUSSION

Adelaide Steele Baylor, State Department of Education, Indianapolis, Ind.—Altho the matter of consolidating rural schools in the United States has been under consideration since 1869, yet rapid strides have been made only in recent years. Today almost every state has taken some steps toward consolidation, and in many states the one-room district school will soon be a thing of the past.

Up to September 1, 1907, in the entire state of Indiana only 1,261 schools had been abandoned, while between September 1, 1907, and September 1, 1908, 350 schools were abandoned, a number equal to more than 25 per cent of all abandoned in the state before that time. Prior to September, 1909, out of 1,017 townships, consolidation had been attempted in less than half, while complete consolidation now prevails in a large number. A little over three years ago, in the state of Washington no effort had been made to push consolidation, and now there are 120 consolidated districts scattered thru 31 counties, and over 20,000 children attended school in consolidated districts last year. A very complete and most excellent report on consolidation, prepared by the supervisor of rural schools in North Carolina, has just been issued from the Department of Public Instruction in that state.

The advantages promised by consolidation are numerous and where the transition has been carefully made they are all in evidence. They include larger school plants;

sanitary buildings with modern conveniences; laboratory facilities; industrial education, including practical agriculture by means of farms in connection with the centralized plant; closer supervision; a new community spirit aroused by the new conditions, and the utilization of the plant as a social center where parents and teachers come together to discuss matters of common interest. Thru consolidation the high school is brought to the rural community with the same completeness that characterizes it in the city. The country boy and girl are not compelled to adapt themselves—many, many times to their detriment—to the city life, in order to obtain a secondary education.

The peaceful establishment and progress of the consolidated school have been aided greatly by railroads, both steam and electric, motor cars, and other improved methods of transportation.

No step in education has been more vital than this of consolidating schools, since it must mean, in a short time, the entire abolition of what has been and still is the idol of many hearts—the little red schoolhouse. It is a serious matter to displace a time-honored institution and its successor must look well to satisfy the causes for its existence, if it would continue. From the one-room building have stepped forth the founders and preservers of our nation. These men have pointed with pride to the rude one-room school in which they received their early education. They have dwelt upon the hardships of that early life and the lack of all such conveniences and facilities as we claim are necessary for a complete modern school. The consolidated schools must produce men of as staunch principles, as powerful intellects, as patriotic purposes, as did the schools they have supplanted. They must produce men and women who will point with the same pride to the consolidated school and recall their obligation to that institution for their education.

Our thoughts and energies must center, not upon the annihilation of the old, but upon the building of the new. The consolidated school is not an experiment, but a necessary step in the evolution of school machinery, and that it may fulfill its purpose in the social scheme, it must be established with care and consideration.

I do not take it that the work of this committee will be so much that of attempting to prove by statistical matter or otherwise that consolidation is necessary as to ascertain why it has not always been a pronounced success, what conditions have led to its ever being contrasted unfavorably with the little one-room school, and how these objections have been overcome.

It will be the business of the committee to investigate the classes of consolidated schools and attempt to determine the best type and the best method for securing this type. It will need to discover whether the typical consolidated school has been most satisfactorily organized by a gradual evolution from the one-room school thru the union school, the consolidated rural school, and other intermediate types, or by a more direct plan of passing from the one-room school to the complete consolidated school.

In this work of consolidation we are taking a step forward that will never be retraced, and the question for this committee to emphasize is how we shall create and perfect these consolidated schools that we may build surely for the future.

David Snedden, commissioner of education for Massachusetts, Boston, Mass.—It seems to me that the problem of rural education has been greatly complicated by certain traditional forms of organization which are peculiar to America. The elementary school was evolved before the high school and, as a consequence, the former is now customarily organized on the basis of eight or nine grades, the high school or secondary school beginning on the top of this. Many of the problems of the rural school would be simplified if the rural-school teacher had to deal only with children twelve years of age or under, older children being transported to centers for the purpose of receiving more advanced education. I believe it is easy to train a young woman to be a successful teacher of children for the first six grades, whereas I believe it to be exceedingly difficult to give a satisfactory education in the normal school for a person who must also teach grades seven and eight.

The weakest part of our American education is that which concerns young people over the age of twelve and under the age of sixteen.

If conditions remain as they are at present, it will be a long time before we shall have teachers who are qualified to handle in rural schools the upper-grade work. It is probable, indeed, that successful upper-grade teaching can be carried on only by means of departmental teaching.

Ernest E. Balcomb, Department of Agricultural Education, State Normal and Industrial College, Greensboro, N.C.—The greatest need of the rural schools is teachers who are properly trained, who have the ability to become leaders in rural communities, who at the same time have such a love for this work that they are willing to devote themselves to it in preference to positions in the city schools.

One of the chief reasons why we do not have more teachers who are adapted to this work and willing to follow it is that our normal schools take the young teachers who come to them from the rural districts where they are in touch with rural affairs and full of enthusiasm and desire to do something worth while for these communities, and make them into better prepared teachers from a scholastic point of view, but also give them a desire for work in the city schools. They give them such a point of view that they look with ill-concealed contempt upon work in a rural community.

I do not mean to say that the normal schools are entirely to blame in this matter, but I do mean to say that much of the training which normal schools insist on, such as Latin and the higher mathematics, not only does not help the rural-school teacher, but actually puts her in touch with a civilization which takes her interest away from that of the rural schools.

There is also much to be said of the duty of the patrons of the rural community schools. They must learn to appreciate the work of the teacher who is actually in sympathy with their mode of life, and they must be willing to compensate the teacher accordingly. They should be willing to say to any teacher who has the right interest at heart, "If you will go and get better preparation, we will give you additional compensation." They should be willing to see to it that the teacher has a comfortable and pleasant place to board. This must be either in reasonable distance of the schoolhouse, or there must be means provided for transporting the teacher.

When these conditions are fulfilled, and the normal schools make a practice of searching out teachers who have this natural talent and training them especially for the rural schools, some of the problems of the rural school will be solved.

I most fully indorse all that my predecessor, Commissioner Snedden, has said. It is generally a question of the teacher.

Edward C. Elliott, professor of education, University of Wisconsin, Madison, Wis.—

[*Abstract*]

I. *The major issue.*—The general inefficacy of the American rural school has been, as we well know, widely exploited during the past two decades; so much so that evidences and arguments have come to assume an unfortunate familiarity of phrase and conventionality of form. The public has, to a regrettable extent, become insensible to the oft-repeated appeals of educational workers, very many of whom have, in spite of themselves, become reconciled to what has appeared to be an inevitably tragic situation in that section of our educational organization occupied by the rural school. The chiefest of the responsibilities of this newly created rural-school committee will be, I take it, to re-establish the rural school in the public conscience, and to chart for the workers in and for rural education one or more new paths by which the rural school may be brought to a higher level of social resultfulness. For who among us would gainsay him who declared that the country school no longer, save in a few isolated and conspicuous instances, either receives or is entitled to that quality of intelligent public confidence that must

underlie its life? The people of our states must be aroused to the point of demanding a new bill of rights for the public schools of the countryside.

II. *The pathology of the rural school.*—It may be safely asserted that a diagnosis of the present conditions of the rural school, divested of all that is of merely incidental, personal, or local significance, will show conclusively that the various ills and weaknesses of the school are due primarily to lack of proper and sufficient nutrition. *The rural school is anæmic.* Instead of supplying the food for the development and vitality of this all-important institution, we have endeavored to cure it by telepathic remedy and to stimulate it into effective activity by preaching a sort of sentimental idealism. The rural school, notwithstanding the momentous changes that have come into our twentieth-century social life, is still one of the major organs of our social body. To keep it healthy, to cause it to perform its functions economically and effectively, it must have the proper nourishment. No amount of public chorusing or of rhetorical phrasing as to the past and present glory of the country school will take the place of the sufficient food of dollars.

III. *The financial remedy.*—The rural school of tomorrow and the next day will be no better than the rural school of today unless our country communities and our states set themselves consciously and intently to the task of bettering the financial foundation of the rural school. This means much more money than has hitherto been considered necessary for the production of effective educational results. It means the tapping of new springs of support. It means more ultimate economy. The index of reform is not to be found in the reconstruction of administrative machinery or in the establishment of new schemes of supervisory control, or in the revamping of courses of study, or in the formulation of *pro forma* requirements for pupils or teachers.

The financial problem of the country school is not now one of the equitable distribution of available state funds. We know the methods by which the existing resources may be best and most justly distributed. The thorogoing study of Cubberley[1] has shown us the way of utilizing to the best advantage the revenues now derived from various sources. The fact that an insignificant few of our states make the most out of their present school incomes is of minor consideration. From the scientific and statistical side the solution of the problem of distribution has been presented. The new problem is to cause the people to realize that rural-school reform means more than the juggling of funds.

IV. *The financial campaign.*—If I have rightly interpreted this portion of the task before the Committee on Rural Schools, it is to discover ways and means that will guarantee to every rural school a constant sufficiency of support. Just what this sufficiency should be is fairly well established today in the standards of educational economists and engineers. We know within the reasonable limits of variability what sum should be expended on a rural school, whether it be a one-room, two-room, or ten-room school, in order that there may be a fair chance of producing those results that approximate the needs of our civilization and typify the idealism of our education.

One aspect of this extraordinarily complicated problem seems clear, and that is, that the country school must become far more than it is today a *state* school. Organization, support, control, and supervision of the school on the basis of minor territorial jurisdictions have been proved the country over to be serious hindrances. Local self-government in rural education, that deceptive platitude of the politicians on and off the platform, has meant an insidious growth of local self-complacency, itself the greatest obstacle to the logical and necessary development of the school. The problem of rural-school improvement is one of rural-school funds; the problem of rural-school funds involves a widespread campaign among the people of our different states so that it will be realized that the interests of each rural school are of the deepest concern to each community and to each inhabitant of the state. Unity of educational purpose is bound up with unity of fiscal support.

TOPIC: BY WHAT STANDARDS OR TESTS SHALL THE EFFICIENCY OF A SCHOOL OR SYSTEM OF SCHOOLS BE MEASURED?

A

GEORGE D. STRAYER, PROFESSOR OF EDUCATIONAL ADMINISTRATION, TEACHERS COLLEGE, COLUMBIA UNIVERSITY, NEW YORK, N.Y.

In discussing the problem of standards or tests for measuring the efficiency of schools or school systems, I come before this group not to make a *report* of the Council committee appointed to consider this problem, but rather to call your attention to the possible line of work which the committee believes may result in the production of a significant report at a later meeting. I shall be guided in what I have to say by the discussions which have already taken place in a meeting of the committee, but I must accept entire responsibility for all statements which are made which may be called in question by anyone in this audience, or by any member of the committee.

The demand that we measure the product of our schools, or that we evaluate methods which are employed in the organization, administration, and supervision of education, is not new, nor is the practice of measurement in this field a matter of recent development growing out of the demand for efficiency. There has never been a time that the schools have not been subject to criticism and to the demand that they measure the results achieved in order to discover how little was accomplished. Ever since there have been teachers, there has been some system of measurement of the result of the training given in the schools. The possibility of accurate measurement in the field of education has, of course, increased greatly with the development of scientific work in this field and with the growth of the teaching profession.

We are not satisfied today with the rough approximation which sufficed a generation ago. We are beginning to define more accurately the ends which we seek. From the study of psychology and from the development of the method employed in social sciences, we are able to evaluate, more accurately than was formerly possible the achievement either of individuals or of large groups. Indeed it may be claimed that the possibility of error decreases in proportion as the number of individuals in the group to be studied is increased. Even in the field of business administration we are making certain advance. One hears continually of scientific management, and in the school field, no less than in other situations demanding organizing and administrative genius, the result of investments is being accurately measured.

It is worth noting in this connection that the advance which has come in scientific work in education is due primarily to those who have devoted

themselves to the study of education as such. It is true indeed that those who have made the most notable contributions have been trained in the fundamental sciences of psychology, sociology, and economics, but the contribution has come primarily from the educational psychologists, from the educational administrator, from the educational sociologist, and not from those who deal with the fundamental sciences without relation to the special problems of education.

Your committee appointed to study the problem "By What Standards or Tests Shall the Efficiency of a School or System of Schools be Measured?" had no difficulty in deciding at its first meeting that its peculiar function was to be found in bringing together the methods employed by students of education, whether serving as administrators or in any other capacity, in order that the practice of evaluation as found at present thruout the United States be made available for all who are interested in educational measurement. To this end the committee plans to invite the co-operation of school superintendents and of all other students of education who have attempted to measure the results of our educational practice. It has been thought well to have prepared an annotated bibliography of all the studies in the field of investigation with which we are concerned, to be submitted as a part of our first report. It is hoped that in this way it will be possible to make available for any student of education the methods which have been successfully applied and the results which have been secured by those who have done significant work in the field of educational measurement.

In inviting your co-operation the committee plans to call your attention to at least three distinct fields in which measurement may be expected: first, with respect to business administration of schools; second, in the field of organization and administration of the more strictly educational activities; and third, in the measurement of the achievement of individual pupils, classes, or schools, in the subjects commonly taught. Under the head of business administration, the type of building erected in relation to its cost, the rating of buildings at present in use, the standardization of equipment and of supplies are among the more important subjects to be considered. In the field of organization and administration of the educational activity of a school system, investigations concerning the attendance of children, involving a measure of the efficiency of the enforcement of the compulsory education and child labor laws, the amount of attendance in relation to the proficiency of children, the effect of part-time classes, the results secured from vacation schools and from a longer school day, are to be considered. Another important inquiry in the field of organization and administration is found in a study of the classification and progress of children thru schools, involving the effect of size of classes, the amount of retardation, acceleration, and elimination, the results of individual instruction, or of special methods of classification and promotion, the value of classes organized to take account of individual differences,

whether of intellect or physical condition. The results achieved by medical and dental inspection, the evaluation of the product secured from special types of schools, from differentiated courses, or from other special educational activity, such as lecture courses, recreation centers, playgrounds, civic centers, and the like, are topics receiving the consideration of progressive administrators thruout our country. The attempt to measure the success of the teacher's work, analyzing the qualities which make for successful teaching, the rating of teachers, and the evaluation of the agencies employed in training teachers in service may also be considered in the discussion of tests of organization and administration.

In measuring the achievement of individual pupils, of classes, or of schools, in the subjects commonly taught, it is to be remembered that a beginning has already been made in the direction of deriving scales or units of measurement. The work of Rice and of Cornman in spelling; of Stone and of Courtis in arithmetic; and of Thorndike and Ayres in the derivation of a scale of handwriting is familiar to all. It is to be expected that scales or units of measurement in other fields will be added in the near future. Of course no one claims that these methods of measurement include everything that is demanded by way of a measuring stick of our educational activity. It will not be denied, however, that this beginning is no less significant than were the beginnings of measurement in other fields. There was a time when the units employed to measure time, distance, volume, and the like were clumsy tools as compared with our modern, more accurate measures. Of course the imperfection of these units was never a valid argument against their use, but rather an incentive to those who worked to perfect them. Likewise in the field of education, the beginnings which have been made enable us roughly to evaluate certain educational products and they suggest the necessity for further work in this field. However adequate or inadequate the measures commonly applied are, it is nevertheless true that every administrative or supervisory officer is constantly passing judgment with regard to the success of the work done in his system of schools in each of the subjects or groups of subjects taught therein. Your committee will endeavor to bring together and to make available for students of education the methods which have been most successfully employed in measuring the ability of children in school subjects.

In submitting to students of education a classification which suggests fields in which the evaluation or measurement of educational activity is desired, it is the expectation of your committee that each superintendent or student of education will submit for our consideration the methods which he has employed in his situation in measuring some actual educational product. We believe that investigations which are not commonly known, and methods of measurement which have been successfully employed, can in this way be made available for all who are interested in this field of inquiry.

In calling attention to the fact that there are three main fields of investigation, namely, business organization, educational administration, and scientific measurement of the achievement of pupils, classes, or schools, your committee is not unaware of the fact that these three types of inquiry are mutually interdependent. Any complete survey of a school or system of schools will of necessity involve inquiry with respect to each of these types of educational activity. No greater mistake can be made than to think it possible to investigate a school system with regard to a single element or type of activity while disregarding other related factors upon which the special function investigated may depend. For example, one might discuss at length the progress of children thru school and be absolutely unfair to the system under investigation. The question of progress involves, of course, the provision in the way of buildings which permits of classes of reasonable size on full time, as over against inadequate provision for housing children which may require a large percentage to spend only half-time in school. The percentage of promotion in any school system cannot be disassociated from the standard of achievement which is required of children who pass from grade to grade. Any adequate study of retardation must take account as well of the qualifications demanded of teachers, the salaries paid to them, the provision which is made for textbooks, apparatus, and supplies, the organization of special classes for the backward, the defective, and the delinquent, without any one of which elements the school may not hope to achieve thoroly satisfactory work. In any other field, whether of business administration, of educational organization and administration, or concerning the achievement of pupils, it will always be necessary to consider each problem, however distinct it may seem, in its relation to the whole school situation. Your committee will be interested in whatever attempts have been made, or whatever methods have been employed to measure any activity or phase of school work. It cannot fail at the same time to call attention to the fact that the investigation of a small part of the management or of the product of a school system will of necessity lead to a false view of the school situation, and may result in overemphasis upon some one phase of school activity which may in the long run prove injurious rather than helpful. For example, the testing of the product achieved in certain phases of work in arithmetic may result in overemphasis upon this work in the schools. It will be necessary in order to safeguard against such mistakes to derive standards which shall take account not only of the product secured, but also of the amount of time required to secure these results. Indeed, wherever investigation is undertaken with respect to a single subject, or a part of the whole group of subjects taught, there will be a tendency to slight the subjects concerning which investigation has not been made in favor of those subjects in which results have been measured. In the field of organization and administration, the investigation of the

problem of retardation may conceivably result in an emphasis upon promotion which will be harmful to the best interests of children. The problem of slow progress is not solved simply by promoting 95 per cent of all of the children at each term's end, even tho such promotions may result in a good showing when this particular system is compared with some other with respect to retardation. Partial investigations must at present characterize much of the attempt to measure educational products, and the fact that these investigations do not and cannot tell the whole truth, that they frequently raise the problem rather than answer it, must be kept constantly in mind. We hope, and we believe, that it will eventually be possible to take into consideration, in evaluating the work done by any system of schools, all of those elements which enter into and determine the success or failure of the work done. We hope, thru the co-operation of those who are actually engaged in educational work, to bring together the experience of all, and to organize this experience in such form as to aid in the development of a system or scheme of measurement which will take account of the complexity of the situation with which we deal.

B

EDWARD C. ELLIOTT, PROFESSOR OF EDUCATION, UNIVERSITY OF WISCONSIN, MADISON, WIS.

[*Abstract*]

I. *The rural school and the efficiency movement.*—That potent stimulant for the reform of our industrial activities and our social institutions to which the name "efficiency" has lately been given has not yet to any appreciable extent influenced the rural school. This delay is only natural. The public schools of the city have just begun to subject themselves to scientific value-measuring processes; and the rural schools always lag far behind their urban cousins in the adoption of new methods and standards of progress.

Withal, the emphatic need of making a truthful balance sheet of the business of the rural school has been demonstrated in numerous ways. A naïve pride and faith in our educational institutions cannot much longer keep us from confessing that the country school is in grave danger of becoming, if this is not already the case, the shame of the countryside. The *graft* of the city, that baffling obstacle to all civic reform and stability, may be said to be paralleled by the *craft* of the country in concealing the weaknesses of its most fundamental institution—the school.

One-half of the children of the country, notwithstanding the rapid urbanization of our population, still receive their formal education in the rural school—the one-room, isolated school. If our modern notions of social and institutional economy have led us to attempt a scientific evaluation of the processes and results of public education in the city, such evaluation is all the more necessary in the country, with its distinctive problems,

its inborn conservatism and complacency. Our rural industries are, under the pressure of an evolutionary economic necessity, being reorganized and revitalized thru the application of the principles of the economic and natural sciences. The schools of our ruraldom demand for their reorganization and revitalization, even more than do the schools of the urbandom, the employment of our entire stock of scientific procedure in education. This problem is, for obvious reasons, a complicated and difficult one, one that may not, however, be longer neglected; for neglected it is.

II. *The method of rural-school betterment.*—Four years ago, at Washington, during a discussion of the problem of vocational education before the Department of Superintendence, it was suggested that all rational educational reform passes thru four stages—the stage of *stress*, the stage of *investigation* and *experimentation*, the stage of *propagandum*, and the stage of *reorganization*.[1] It was further suggested, concerning these several stages, that the stage of investigation and experimentation was, by far, the most difficult of passage; and that we needed to be in possession of the facts pertaining to industry and children before we could carry on a sane propagandum for a vocational reorganization of our public educational scheme. This generalization as to the mode of our educational progress appears to be thoroly valid when tested by recent events in the industrial adaptation of the public school. Moreover, its application to the rapidly pressing problems of rural educational reform seems to be equally valid.

The country-wide campaign for the betterment of the rural school now being carried on will not be productive of any widespread improvement or intensification of the education of the children of the country regions until there is such careful investigation of existing conditions as will reveal in conclusive and indisputable form the naked facts that are directly responsible for the enervation of the rural school. Today these facts are felt rather than known, and until they are exhibited without bias or higher criticism, there will be no arousing of city and country dwellers to what appears to be a democratic nation's shame. This investigation must be accompanied or immediately followed by experimentation and effective demonstration of what the country school should be to realize our American ideal of a public-school education and to fulfill the human ambition of country boys and girls to live that life of usefulness and contentment which is rightly theirs by heritage.

III. *Rural-school standards of worth.*—While it cannot be denied that we are in possession of mountains of general facts relative to the present worth of the typical rural school, these facts are in general of a character that makes an appeal to the sentimentalist rather than the scientist; more usable for oratory than for convincing argument. Whatever other value these general facts may have, they are in their present uncorrelated

[1] See Edward C. Elliott, "Equality of Opportunity . . . . ," *Proceedings of the National Education Association*, 1908, pp. 159–61.

and undigested form, useless as foundation material for the establishment of new standards of accomplishment. The numerous bulky reports of our various state departments of public instruction represent, with a very few exceptions, waste rather than conservation of scientific effort. In so far as its work becomes concerned with the question of determining the accomplishments of the rural school this National Council Committee on School Efficiency will be able to perform a distinctive service if it succeeds in planning a co-operative scheme for gathering from the entire country the essential facts that underlie a constructive program. There is need of concentration upon specific issues. The existing administrative machinery of public education will not permit the gathering of *all* the facts, *all* the time, for *all* the country, but it is possible by co-operation to secure, one at a time, a few essential facts for the entire country. These facts we do not now have.

There is a generally recognized standard for urban elementary and secondary schools. We need to know the constitution of a standard rural school, and by this standard to develop among our country teachers, school officials, and people a consciousness of the comparative worth of their own schools. This standard rural school needs to exist in reality, not merely in theory. It has seemed to some of us that the recent movements to secure federal aid for agricultural and other vocational education in the several states might better have recognized the principle of indirect, rather than direct, aid in so far as these movements were calculated to better rural schools. The establishment and maintenance by the federal government of one or more demonstration rural schools, both one-room and centralized, in each of our states would render incalculable service for the elevation of the standards of efficiency for rural schools, far more perhaps than direct appropriations in aid. A standard of value in education, whether it be in finance, organization, or instruction, must exist as a living objective value before it will serve to stimulate our people and our educational workers into an active desire to reconstruct the rural school. The layman is as sensitive as the expert to the demonstration of real values. The ordering of these values yet lies before us as one of our great tasks.

DISCUSSION

Carroll G. Pearse, superintendent of schools, Milwaukee, Wis.—Knowing the expected trend of the remarks of most of those who are to speak in the discussion this morning, I have cast about for a few methods of testing our work which are not quantitative and which perhaps will not be discussed by others.

I recognize, as we all do, the great value to come from these splendid detailed studies which are being made for the purpose of showing us how to test the effectiveness of our work. But there are also certain different signs in which we may read our success or failure as teachers or as administrators of schools.

One of these tests, which any of us can apply, is to note whether or not the teachers and pupils in our schools are experiencing the "joy of life." Every child, also every

teacher, has a right to be happy; if he does not enjoy his life and his work, something is wrong somewhere. The school ought to be so conducted that the children in it can be comfortable and happy. Their work should not be unpleasant nor should the conditions under which it is done be such as to make them feel that school life is merely a grind. The schoolroom should be characterized by sunshine, material and temperamental. The work of the teacher also should be comfortable. Such a definite setting-forth of the things which are expected of the teacher should be made that he will be able to know when he is accomplishing, with reasonable success, those things which are expected. Such an atmosphere should surround the teacher's work that he may be sure of wise leadership, sympathetic counsel, and firm backing in those things which are right. If the teacher's work were so arranged and directed that he might have more of the joy of life, we should have fewer worn-out or broken-down instructors of youth.

We may test the effects of our teaching also by noting the bearing of our pupils upon the streets and in their common intercourse with each other and with their elders, and their bearing toward strangers. Any observing person knows that the attitude of children toward the inquiring stranger differs greatly in different cities; that it differs also in different parts of the same city. And this difference in bearing toward persons with whom the pupils come in contact is different where home conditions, general intelligence, and other contributing causes outside the school appear to be the same. Who that has had years of experience in supervising schools has not seen the attitude of the pupils in some school change from the rude and boisterous and inconsiderate to a manner of courtesy and consideration, and back again to carelessness and rudeness, as the management of the school in that neighborhood has changed? A very good test of our success, in at least one direction, may thus be read in the street manners and bearing of our pupils.

It is possible for us to judge, without quantitative measurements, whether the pupils and the teachers are doing their best—working up to their capacity; getting out of themselves the best that is in them. A popular writer tells of his experience on the first day of a trip into the woods. In starting, his guide took a load of camp supplies and equipage weighing one hundred pounds upon his shoulders; the writer was given fifty pounds to carry as his share. They tramped until well along in the afternoon when the town man became so tired he thought he could not go farther, and demanded of the guide that they camp where they were. The guide explained that a few miles farther on was a splendid camping-ground which he had selected for the night. The man on vacation summoned up his courage and tramped on two or three miles farther, then sat down on a log and declared he could not and would not go another step but camp must be made where they were. The guide said nothing but picked up the fifty-pound pack his employer had been carrying, set it on top of his own load of one hundred pounds, and started out for the point he had selected for the evening's camp. The man who had thought himself completely exhausted was so ashamed by this turn of affairs that he seized his fifty-pound pack from the guide, put it on his shoulders, set his teeth together, and tramped along without another word until the camping-place was reached.

This lesson may be taken to heart by many a teacher and many a pupil. We think we are doing all we can many times when the fact is we might do 50 per cent or 100 per cent more. It is an important part of education for each person to learn to do his best. Some attention to this point will show whether or not we ourselves, as teachers, are doing our best, and whether or not our pupils are doing all that they ought to do.

We may judge our success also by noticing whether or not our pupils remain in the school and show some interest to receive all its benefits; or whether, at the earliest possible moment when the law or the parental authority will permit, they leave our instruction to enter upon some other occupation. That school system out of which the children are dropping in too great numbers after they reach the upper grammar grades, that system in which too small a number of them continue their studies into the high school, is not

measuring up to the proper standard of success. It may be that the parents need to be educated as to the value of the education given in school; it may be that the boys and girls themselves need to have shown to them what they are losing if they leave school at an unnecessarily early age; it may be that the school itself needs attention; that its methods are not such as to attract and hold the pupils, or that the subjects taught and the manner of their presentation are not such as to appeal to the interest of pupils or to cause the boys and girls to feel that school studies are of value. Whenever in any school the tendency among pupils is to drop out, to leave the school before receiving all of its benefits which they might remain to get, the attitude of the parents toward the school, the estimation in which the children hold the school and its exercises, the methods of conducting the school and presenting the subject-matter, and the subject-matter of study and the exercises of the school, all should be carefully scrutinized to see where the trouble lies.

The school may also measure its effectiveness by the attitude toward life which its pupils have after leaving the school. If they are found to be selfish, content with low standards of life and low aims; if they are indifferent toward their neighbors and lack the kindly interest and readiness for kindly service which all members of the community ought to manifest toward each other; if they are indifferent toward the civic welfare of the city or state in which they live, and think of the government only as a possible means of exploitation or of advantage to themselves, instead of feeling that they are citizens, charged with responsibility for the welfare of the other dwellers in the municipality or state; if they are indifferent when movements for the public weal are forward: then the school has failed in its highest opportunity. We, as teachers, are advertised by our product; unless the school implants in the majority of its pupils good ideals of conduct and of life, a good disposition toward fellow-men, and a high standard of duty to, and responsibility for the welfare of the state, we may know that something, a very important part of our opportunity as teachers and school administrators, has been lost sight of or that we have failed in its realization.

Charles H. Judd, director, School of Education, University of Chicago, Chicago, Ill.—One very common method of judging the efficiency of a school is to observe the work which the students do in the advanced school to which they pass after leaving the lower school. Teachers in the fourth grade are constantly judging the efficiency of the third grade by students who come from the lower into the higher class. The same method of judgment is applied by colleges to the high schools and by high schools to the upper grades of the elementary schools. The business of educational science is to refine this method of judging efficiency and make it more exact and explicit.

Since the college is judging the high school by the character of the students who come from the high school, an effort should be made to gather as complete a record as possible of the work which is done by students in both of the institutions involved in this judgment. The importance of a complete record is illustrated by the fact that many colleges judge high schools adversely when students fail in their college courses. Sometimes the failure of a student could have been anticipated by a recognition of the grade which he took in the lower schools. When the high school sends a low-grade student to the college with a definite statement of the fact that the student took low rank in his high-school courses, it is not to be expected that he will excel in his college work. Recent elaborate investigations have made it perfectly clear that a low-grade student in the high school is likely to continue to do poor work after he goes into the higher institution. The question which should be asked in all these cases can be formulated as follows: Does a student maintain in the school to which he is promoted the same relative rank that he held in the lower school? That is, does the student who stands in the highest third of the high-school class succeed in maintaining himself in the highest third of the college classes, or does he

fall to a lower position? If he falls to a lower position, an adverse judgment of the school is so far justified. If in a number of cases the experience is repeated, all of the students from a given high school failing to carry on in college the standard type of work, the justification for an adverse judgment is complete. On the other hand, if a college finds that students are able to rank higher in college classes than they did in the high school, it is time for the college to consider whether its standards are as high as those of the high school from which the students came.

Information necessary to answer questions of this type cannot be collected by a single institution. Students from a given high school scatter to a number of different colleges. There should be co-operation between the colleges and the high schools, and information of this sort should be collected on a large scale by some central committee or bureau. If such centralized information were at hand, it would be possible to judge accurately the standard of both the colleges and the high schools. The North Central Association of Colleges and Secondary Schools is collecting information of this type. If the National Council or the Department of Superintendence could be interested in the same kind of information, it would be possible to develop the plan so as to include elementary schools as well as secondary schools and colleges. Several progressive high-school principals have shown by studies of this type that it is possible to judge the efficiency of the elementary schools of a city with great accuracy. Mr. Miller of the Kansas City High School was able to select the elementary schools in his city which were doing the most efficient work in different departments by a study of the students who came from these schools into the Kansas City High School. In the same way, Mr. Carter was able by a careful study of the Milwaukee records in elementary and high schools to show the relative efficiency of the different elementary schools in that city.

A comparison of institutions thru information of this sort is much safer than a comparison of institutions thru the opinion and judgment of individual supervisors. Furthermore, the people who are judged by this kind of information are very much better satisfied that they have been treated with fairness. There is no conflict between the ordinary methods of school supervision and this suggestion for a more accurate and scientific study of the same problem.

Z. X. SNYDER, president of the State Teachers College, Greeley, Colo.—

1. RESULTS OF AN EFFICIENT SYSTEM

1. A school system to be efficient must so train and develop the individual that he shall enter into his various stages of life normally at the proper time and be self-supporting when he enters life at his majority, be able to earn a living, to accumulate some property, and to own a home. In short, the system must individualize him.

2. An educational system to be efficient must train the individual thoughtfully, feelingly, and actively to support our institutional life, as the home, the school, the state, with its manifold activities in its development; and to help and enrich the mass—the social group. Again, the system must socialize him.

3. A system of schools to be efficient must train the individual to have a stable attitude in all human endeavor—to have an intellectual balance, to be sympathetic in his life, and to be a person of action.

4. An educational system to be efficient must provide for all conditions of the human family, the weak, the strong; the young, the old; the fortunate, the unfortunate—indeed all states and conditions.

5. An educational system to be efficient must rest on the fundamental eugenic principle that after an individual is in existence, he must be protected, helped, and the best made of him for life's sake.

II. SOURCES OF IMPULSES APPEALED TO IN ATTAINING THE RESULTS

1. The first is the biological impulse of self-preservation. Out of this impulse come all the elements of individuation—self-support, accumulation, opinion, self-determination, self-assertion, self-perfection, self-realization, etc.

2. The great and fundamental impulse, also biological, to which the former impulse leads is that for preservation of the species. Out of this come all the elements of communication, mutual aid, socialization, helpfulness, the larger civilization which enfolds all humanity, etc.

III. ELEMENTS FOR SECURING EFFICIENCY

The evaluation of experiences: as idea, fact, belief, truth, motive, ideal, action, etc., is found in the following:

1. The potential value of an experience is its expectancy. Out of this come anxiety, thought, hope, impulse, passion, heart, and life for the realization of the experience. The school system in its organization, management, and in its teaching—indeed in its life should aim to develop a high potential.

2. The actual value of an experience is the realization of the expectancy, to attain which the individual acts—in which he works up the experience into a richer and more complex experience by thinking and doing.

3. The efficient value of the experience is measured by the amount of service rendered to self and to others and to the institutional life. It is measured by how much aid, by how much kindness, by how much sympathy, by how much thought, by how much action has entered into the realization—has entered into the real and living situation.

IV. ORGANIZATION OF THE ELEMENTS

1. The stage of development in which the child or the person is living must always be taken into consideration in order to attain the results in testing the standards of efficiency.

2. There must always be an arousing, stimulating, and organizing of the experiences of the person or persons at the particular stage of development that there may be the highest potential, highest actual value, and the highest efficient value for service.

3. The individual's life must be taken into consideration in the presentation of the organized experiences.

4. Indeed the curriculum, or material or stuff that is used, must therefore grow out of the life of the individual at his particular stage of development and back into it to enrich it in the complex individual and social situation.

V. SOURCES OF STIMULATION OF EXPERIENCES, ETC.

1. The organism itself affords the foundation or basis for stimulation as indicated above, both in self-preservation and in the preservation of species. The individual is organically selfish and should be. The fibers of the roots of our civilization find its nourishment in these impulses.

2. The environment, the complex of things round about the person, all serve in the organization of the experiences or life of the individual. It is a process of nature and nurture.

3. Again, I would say that the source of material should grow out of the life within and the life without the individual—his organic, subjective life and the environmental life.

VI. SUMMATION OF STANDARDS OF TESTS, ETC.

1. The individual must live in every stage so as to enter fully, readily, and righteously into the life about him. The standard of the test of a system is such as must bring

about this sort of living. The little child of six has just as real and important life as the adult has in his stage.

2. The system must be such as to enable the individual to realize on his experiences should he have to drop out of the school at any time. He should be able to do something to preserve himself and others in accordance with the stage of development in which he was and is now living. He should be able to earn a living and to add to the sum-total of human happiness in civilization. He should be co-operative. The test of efficiency of a system must be such as to bring this result.

3. The test is not to prepare for complete living which seems to contain an element of futurity, but to have complete living now at the particular stage of development in which the individual is living. Life is a series in which each preceding term is in each succeeding term.

4. The test of a system is not in examinations, not in recitations, not in deportment cards, not in the number sent to higher educational institutions, not in the ability to think, even. While all these aid, the final and crucial test is the reaction in adult life in character, in pure living, in thought, sentiment, and deed, summing up into the statement of the poet, he lives most who thinks most, feels most, and does most.

LOTUS D. COFFMAN, supervisor of Training School, Eastern Illinois State Normal School, Charleston, Ill.—Advancements in education are made by varying the emphasis upon the problems of education. Philosophers seldom see the entire field of education in its wholeness or the movements within it in their reciprocal relations. Advancement rather is made by throwing the emphasis at one time upon one problem and at another time upon another. Each new problem tends to be raised in our class-consciousness to a place of importance all out of proportion to its real worth. This leads many an enthusiastic reformer astray and in its reaction causes the conservative and judicious administrator to cling more tenaciously to those things that have been sanctioned by a long experience. Nevertheless, child-study, correlation, recapitulation are but the catchwords of movements that have at one time or another dominated our thinking.

Just now we are being urged and spurred on by a widespread movement to reduce every type of productive activity to scientific management. Educational leaders here and there, following in the wake of social sentiment and social pressure, have caught up the movement and are now fairly engaged in the attempt to rationalize old standards and to discover new ones. This movement or emphasis, like all the others, will leave us a modicum of useful information. More than that, it is likely to leave as its distinctive contribution a method of work for refining the standards now being secured and for discovering new ones. We believe that the laws of education and the central tendencies of the facts of administration are discoverable in nature. That they will shift with time, place, race, age, and the like, every student of sociology knows, but that these variations are in accordance with law, every student of science believes.

It must not be understood that we have had and have now no standards in education. It is nevertheless true that such standards as exist have been secured thru the laborious processes of trial and error. Many of them have been arrived at and have been practiced so unconsciously that they have become a part of the *mores* of the teaching population. Many a young superintendent who has not become inoculated with these rather habitual modes of practice has spent much of his comparatively brief career wool-gathering, grasping at straws as he groped blindly about in his efforts to get hold of something that would enable him to rate his teachers and to judge the work of his schools. On the other hand, some superintendents of long experience who are thoroly saturated with our class traditions, have looked upon the liberalistic views of recent reformers as unnecessary, if not anarchistic. Their attitude has been almost that of "Let well enough alone"; with a field fairly teeming with problems to be solved, they see none. They act toward a multitude of situations as schoolmasters have always acted.

Another type of standard is that which is created by definition. Such standards are usually registered in laws. Many of them grow not so much out of a breakdown of practice as out of an effort to make conditions more ideal. Both of these factors are, to some extent, always present when we seek to create by law standards for controlling, managing, and rating schools. There is some dissatisfaction with existing conditions, a sense of maladjustment, a failure of the old practices to work; this in itself is cause enough to warrant the establishment of new standards. But more frequently our dissatisfaction causes us to project our experience into the future and we set up idealized standards.

Standards by definition have already covered a multitude of subjects. They have to do with the collection and distribution of school funds, the certification and salaries of teachers, the accrediting of high schools, the kinds of discipline permitted, the number of years children must attend school, the number and kinds of subjects that must or must not be taught. Most of these topics have been legislated upon.

In addition to those standards which have been established by legislative enactment, there are still others that have been formulated by organizations, operating under private initiative, or by educational institutions acting under a co-operative agreement. Such institutions and agreements as the Sage Foundation, Carnegie Foundation, the Bureau of Education, the North Central Association of Colleges and Secondary Schools are examples of what I mean.

Again, we speak of one school as excellent and another as good, of one as superior and another as inferior; we know that such terms refer only to common-sense judgments as to what is true of the schools as a whole. It is quite impossible that a given school is excellent in everything, good in everything, or bad in everything. Any attempt to define such general expressions as these or such other expressions as "third-grade ability," "fourth-grade facility in numbers," "more than average skill in the drill subjects," and the like, have certainly been moves in the right direction. However, much of this work, valuable and indicative as it is, has had the misfortune of being based upon ratings given by observation. It is true that these observations in many instances have been made by people of reputed expert training. Nevertheless, mere observation has certain fundamental weaknesses and faults as a method of arriving at the truth. That observation and individual opinion have been great factors in securing progress, in education as well as elsewhere, no one can deny; but just now, in the physical and social science fields they are being superseded by more refined methods. Once we were satisfied with a statement if we knew who said it, now we want to know what the evidence is; the *ipse dixit* of the leader was once sufficient, now he must give us the facts if he wants a hearing. I know very well that desire for facts and evidence is looked upon by some as educational heresy. It is not heresy; it is a more rational attempt at getting at the truth. It is not heresy; it is an attempt to define some of the lump judgments of current thought. It is not heresy; it is an attempt to render more scientific educational procedure. Those of us who believe in standards and scales arrived at thru experiments and tests that can easily be duplicated, do not criticize those who sought truth thru observation and opinion. We only ask them to sympathize with the work of a comparatively small group of serious-minded students of education who are studying its problems quantitatively. What could be more unprofessional than an attitude that sneers at any attempt to arrive at the truth!

The difficulty in handling problems that lie within the field of teaching method is found in the fact that they deal directly with human nature. This makes them far more subtle, complex, and variable than those that pertain to school finance. It was but natural that we should give attention to the number of children per teacher, the number of recitations per teacher, the wage scale, the heating and ventilation of buildings, and the like, before we focussed our attention upon the more intimate and vital problems of actual instruction. We know more about the material conditions for teaching than we do about the act of teaching. The evolution of standards has always been from the obvious

to the less obvious. Quantitative measurement took hold of those things first that were most concrete; the apparently more intangible things were regarded as qualitative. But that which was qualitative at one time, as our methods were improved became quantitative at a later time. The fact that we have no proper units and scales with which to measure some things is no evidence that we may not have later on. The fact that we haven't shows the field which will yield the most fertile results. The number and amount of things which we still speak of as being purely qualitative is to some extent a measure of our present state of ignorance with reference to them.

Variable quantities can be measured by employing the statistical technique. Many special studies will be required to secure units and scales that will be accurate and serviceable in practice. In no other way can we advance so rationally from our present rather unsatisfactory position. The difficulties involved in making such special studies will not deter the serious student from attempting them. Such studies as those of Erdmann and Dodge, Huey, Dearborn, Ruediger and Judd of reading; of Rice, Cornman, Pearson, and Wallin of spelling; of Rice, Stone, Brown, Courtis, and Bonser of arithmetic; of Thorndike of handwriting; of Hillegas of composition; of Cubberley, Strayer, and Elliott of school finance; of Thorndike, Ayres, Greenwood, and Blan of retardation and elimination; of Keyes on the progress of children thru the grades; these and many others have put us far on the road both to the establishment of certain facts and to the establishment of a method of work.

These subjects have tentatively established a number of important standards. Before these, however, can be accepted as being of ultimate worth, many of the studies must be duplicated. In no other way can norms be finally established. What we need is a scientific spirit that will induce us to accept the work already done and to try it out. Any enterprising superintendent could compare his school with those described in the studies referred to by using the same methods that were employed there. This would be far better for education than for him to be constantly trying to do something unique.

A mastery of such studies as those to which I have just referred will familiarize one with the different ways of measuring variable quantities. Perhaps a few words explaining it may not be entirely amiss here. It is obvious that people vary as to stature, weight, length of fingers, cephalic index, blood pressure, pulse rates, power of discrimination, ability to add, to spell, to memorize, to write compositions. Variation is not a phenomenon that is restricted to any single individual nor to any group of individuals. It is one of the two facts needed to compare one individual with another or with himself at a previous time, or one group with another group, or with itself at some previous time.

The very presence of variability presupposes the other fact needed in making comparisons. Differences mean difference from something—and that something is the type, which is statistically expressed by the average, the median, or the mode, as the case may be.

These two facts may be made more concrete by borrowing and adapting an illustration from Galton. Suppose we have a funnel-shaped receptacle filled with wheat. Below it is a regular series of vessels of the same shape and base, symmetrically arranged in a row. If the wheat is allowed to escape, an equal quantity of it does not fall into each of these containers. Rather it is distributed according to the law of chance. This law has such mathematical accuracy that we can predict with reasonable certainty the character of the distribution. Those vessels immediately beneath the funnel-shaped receptacle will be filled fuller than those next to them, the amount contained in the vessels grows less and less, as we pass from the center vessels outward until at either end there are vessels containing only a few grains. If the top of each column of wheat is connected by a curved line, we have exactly the same kind of curve as that secured by stature measurement, i.e., the normal frequency-curve. A curve of this character would be secured by plotting the length of men's feet, the batting averages of a baseball team, the deviation from

a bull's eye at target shooting, the number of spots turned up in twenty throws of the dice, the ability of a class to multiply mentally one three-place number by another, the speed of a class in reading, the efficiency of a class in handwriting, the imagery of a class in studying a poem, the location of a school among a system of schools with reference to any quality considered.

Now we cannot predict where any single grain of wheat would fall. We can only predict as to what will be true of the distribution of the wheat in general. But the chances are high that any single grain of wheat will fall nearer the middle and they are exactly even that it will fall above or below the middle position. Individuals tend to cluster about the average, or the median, or the mode, i.e., about the central tendency. No description of any group is complete unless the whole extent of the deviation in each direction from the group average is shown.

Any school or system of schools that falls above the group average for any particular characteristic is in the better one-half of the schools, and any school or system that falls below the group average is in the poorer one-half of the schools. The total range or distribution can be broken up into fourths or quartiles, so that one can tell whether his school as to the ability or item measured falls within the best fourth, the second best, the next to poorest, or the poorest.

There are certain other facts pertaining to the measurements of relationship which I shall not take the time to discuss. They have been amply treated in several very good books, dealing with the statistical procedure. I refer to Thorndike's *Mental and Social Measurements*, to Elderton's *Primer of Statistics*, to Yule's *Elementary Theory of Statistics*.

Such a plan as that which I have but briefly described, does not supply us with a scale which measures differences in merit as multiples of some unit. So far, we have only one such scale. I refer to Thorndike's scale for handwriting, an account of which will be found in *Teachers College Record*, March, 1911. This scale is based upon more than twenty thousand ratings of specimens of handwritings. The samples finally selected were progressively arranged on the basis of these ratings in equal steps. For example, sample 4 is as much better than sample 3, as sample 3 is better than sample 2. By using this scale the ratings that a classroom teacher gives a pupil's writing have a definite meaning. She can compare one pupil's writing with another or with his own performance at some earlier time. The scale may be used to show the actual rate of improvement of the individual, of the room, of the school. The values of different methods used in teaching handwriting may be effectively determined by this scale. A superintendent will use it to measure samples of handwriting from individuals, classes, cities, groups chosen for grade, age, sex, method of teaching, or length of time devoted to writing, or to measure any other variable involved in instruction in handwriting. Even business men will find it a convenient instrument to determine the rating of the quality that they want.

Other such scales are being constructed now. Words in spelling could be rated in the same way as to their difficulty. So also could there be a standard series of problems in arithmetic for each age or each grade. The important dates or facts in history or in geography might be put to scale in the same way. Selections in reading could be rated in the order of their value or of their difficulty. There is no end to the scales that might be determined were there but enough men interested in the scientific aspects of education to prepare them.

The time when we shall have standards for testing schools determined by thoroly scientific methods is approaching. In the meantime, we must continue to trust for many things to the judgments of our wisest leaders; we must continue to create standards by definition; and we must continue to reduce those things thoroly agreed upon to the plane of customary action. I feel, however, that we shall grow most progressively and sanely by the application of the laboratory and statistical method. Introspection can never in any true sense give us an applied science. The real advance must come from an acquaintance with the experimental technique.

CHICAGO MEETING

OFFICERS

President—CHARLES H. KEYES, president of Skidmore School of Arts..Saratoga Springs, N.Y.
Vice-President—WILLIAM M. DAVIDSON, superintendent of schools.....Washington, D.C.
Secretary—ROBERT J. ALEY, president of the University of Maine.....Orono, Me.

FIRST SESSION—SATURDAY FORENOON, JULY 6, 1912

The National Council of Education met in the Gold Room of the Congress Hotel, Chicago, Ill., and was called to order at 10 A.M. by President Charles H. Keyes.

The president appointed a committee, consisting of Robert J. Aley, president of the University of Maine, Orono, Me.; J. Stanley Brown, principal of Township High School, Joliet, Ill.; and Carroll G. Pearse, superintendent of schools, Milwaukee, Wis., to report the revised constitution of the Council to the Board of Directors of the National Education Association.

The president appointed John R. Kirk, president of the State Normal School, Kirksville, Mo., to take the place of E. E. Brown, chancellor of New York University, New York, N.Y., and J. Stanley Brown, principal of the Township High School, Joliet, Ill., to take the place of Augustus S. Downing, first assistant commissioner of education, Albany, N.Y., upon the Committee on Membership. The appointments were for this meeting only.

"The Final Report on High-School Preparation of Students for Normal Schools" was then presented by David Felmley, president of the State Normal University, Normal, Ill.

The report was discussed by John H. Phillips, Birmingham, Ala.; J. Stanley Brown, Joliet, Ill.; E. A. Jones, Waterville, Ohio.; Thomas A. Mott, Richmond, Ind.; Homer H. Seerley, Cedar Falls, Iowa; John W. Cook, De Kalb, Ill.; W. A. Brandenburg, Oklahoma City, Okla.; John R. Kirk, Kirksville, Mo.; and C. P. Cary, Madison, Wis.

SECOND SESSION—SATURDAY AFTERNOON, JULY 6, 1912

E. T. Fairchild, state superintendent of public instruction, Topeka, Kans., presented the "Report of Progress of the Committee on Rural Schools." (See papers of St. Louis meeting.) Those engaging in the general discussion were: H. B. Brown, Valparaiso, Ind.; Adelaide S. Baylor, Indianapolis, Ind.; A. J. Matthews, Tempe, Ariz.; J. Y. Joyner, Raleigh, N.C.; and John R. Kirk, Kirksville, Mo.

Upon motion of Robert J. Aley, Orono, Me., the president was asked to appoint a committee to formulate a proper tribute to the memory of Julia Richman, New York, N.Y.

This matter was referred to the following committee:

A. E. Winship, Boston, Mass. J. Y. Joyner, Raleigh, N.C.
Nebraska Cropsey, Indianapolis, Ind. John MacDonald, Topeka, Kans.
W. J. Kerr, Corvallis, Ore.

THIRD SESSION—SATURDAY EVENING, JULY 6, 1912

In the absence of President Keyes, Joseph Swain, president of Swarthmore College, Swarthmore, Pa., presided at this session.

The following report of the Committee on Membership was unanimously adopted:

JAMES Y. JOYNER, Raleigh, N.C., *Vice-President*.....Term expires 1915
ELLEN C. SABIN, Milwaukee, Wis., Executive Committee.....Term expires 1915
AUGUSTUS S. DOWNING, Albany, N.Y., Committee on Membership...Term expires 1915
CARROLL G. PEARSE, Milwaukee, Wis., Committee on Membership..Term expires 1915
A. C. NELSON, Salt Lake City, Utah, Committee on Membership....Term expires 1913
JAMES M. GREENWOOD, Kansas City, Mo., Committee on Investigations and Appropriations.....Term expires 1915
FRANK A. FITZPATRICK, Boston, Mass., Committee on Investigations and Appropriations.....Term expires 1915
PAYSON SMITH, Augusta, Me., Committee on Investigations and Appropriations.....Term expires 1915

MEMBERS

TERMS TO EXPIRE IN 1918

Ella Flagg Young, Chicago, Ill., to succeed herself.
Edwin S. Monroe, Muskogee, Okla., to succeed himself.
W. H. Elson, Cleveland, Ohio, to succeed himself.
John W. Carr, Bayonne, N.J., to succeed himself.
Edward C. Elliott, Madison, Wis., to succeed himself.
Grace C. Strachan, New York, N.Y., to succeed herself.
Adelaide S. Baylor, Indianapolis, Ind., to succeed herself.
Carleton B. Gibson, Rochester, N.Y., to succeed himself.
C. G. Schulz, St. Paul, Minn., to succeed himself.
Oscar T. Corson, Columbus, Ohio, to succeed himself.

TERMS TO EXPIRE IN 1913

Fannie Fern Andrews, Boston, Mass., to succeed Wm. E. Hatch, New Bedford, Mass.
John F. Sims, Stevens Point, Wis., to succeed A. S. Draper, Albany, N.Y.
Bird T. Baldwin, Swarthmore, Pa., to succeed Frank E. Parlin, Cambridge, Mass.
A. D. Yocum, Philadelphia, Pa., to succeed C. A. Herrick, Philadelphia, Pa.
Clem Hampton, Tallahassee, Fla., to succeed W. M. Holloway, Tallahassee, Fla.

TERM TO EXPIRE IN 1914

Katherine D. Blake, New York, N.Y., to succeed Julia Richman, New York, N.Y., deceased.

TERM TO EXPIRE IN 1915

L. E. Wolfe, Memphis, Tenn., to succeed E. E. Brown, New York, N.Y.

TERM TO EXPIRE IN 1916

D. H. Christensen, Salt Lake City, Utah, to succeed Anna T. Smith, Washington, D.C.

TERM TO EXPIRE IN 1917

E. E. Bass, Greenville, Miss., to succeed John W. Abercrombie, University, Ala.

By unanimous vote the Council adopted the following resolutions on the death of Julia Richman:

On June 24, Miss Julia Richman of New York City, a distinguished member of the National Council of Education, died in Paris, after ten days of heroic effort to rally from an operation for appendicitis.

Miss Richman was for many years an eminent leader in educational advance. She fitted herself for this leadership as a grade teacher and principal in New York City before her promotion to the district superintendency.

With superb courage she was the first to successfully defy all political bosses and force them to keep their hands off educational affairs.

With noble consecration she inspired children from the humblest homes so that in a district where no child had ever gone above the sixth grade she saw more than 2,500 in the seventh and eighth grades, with many in the high school.

With deepest human sympathy, she led to the establishment of the first school hospital for crippled children in connection with the public schools of a great city.

With keen patriotic insight she insisted that public schools could do and should do

for all children everything that was best for them by way of physical, intellectual, industrial, social, and moral training.

Therefore, in view of all that Miss Richman was as a noble woman and brilliant leader, be it

Resolved, That we learn of her death with sincere regret; that we remember her life and work with genuine satisfaction; that we appreciate the privilege and honor of having had her as one of our number, and that we here highly resolve to take renewed devotion to that cause for which she gave the last full measure of devotion.

"Educational Progress of the Year" was presented by J. A. Shawan, superintendent of schools, Columbus, Ohio. Those engaging in the general discussion were: Grace Strachan, New York, N.Y.; A. E. Winship, Boston, Mass.; Amelia Fruchte, St. Louis, Mo.; E. G. Cooley, La Grange, Ill.; Walter R. Siders, Pocatello, Idaho.

The Council adjourned at 9:50 P.M.

ROBERT J. ALEY, *Secretary*

PAPERS AND DISCUSSIONS

FINAL REPORT OF THE COMMITTEE ON HIGH-SCHOOL PREPARATION OF STUDENTS FOR NORMAL SCHOOLS

In preparing this report your committee sent letters of inquiry to 120 state normal schools. Some of the questions asked could not be answered accurately without considerable investigation. Others could hardly admit of precise answers in any case. Possibly for these reasons replies were received from only 41 institutions, yet these replies were from 25 states representing every section of the country and present a body of fact and opinion sufficiently uniform to justify, we believe, the main conclusions presented in this report. It should be clearly understood that this report deals only with conditions affecting those state normal schools whose students are largely or entirely high-school graduates.

It appears that thruout the country normal-school faculties are generally not satisfied with the quality of the high-school preparation received by most normal-school students. The organization and work of some high schools is entirely satisfactory; many individual students from other schools show excellent preparation. Our conclusions are necessarily based upon the average product. There is no disposition to indulge in wholesale condemnation of the high schools. Their principals and teachers must often bow to conditions that they cannot control. We propose merely to analyze the high-school situation from the standpoint of the normal school, and to suggest such changes as seem desirable and practicable.

THE FUNDAMENTAL DEFECT

The chief defect of the high schools from the standpoint of this inquiry is that in their aim, their curriculum, and their methods of instruction, and in their spirit and life they are too largely dominated by so-called

college traditions and ideals. It is true that our state universities and a few under private administration have recently broadened their entrance requirements so as to leave the tributary high schools more free to shape their programs of study with reference to the needs of the whole community, rather than of a particular class. Yet the inner life of these universities, their spirit, their atmosphere, their ideals, their rating of the relative respectability of studies, have as yet undergone little change. The smaller institutions and especially the women's colleges of the East, which draw students from the entire country and exert an influence quite out of proportion to the number of students affected, tenaciously adhere to the standards of thirty years ago. It is also true that many high-school principals, courageous, dominant, and progressive, have developed high schools whose instruction and life are quite in harmony with the modern spirit. Yet the fact remains that in many of our larger cities the older high schools have accepted fitting young people for college as their chief function. Commercial high schools and manual training high schools are established to care for those who want a secondary education not determined by the prejudices or ideals of the professional or literary class. This separation of our young people of high-school age into two classes, the one dominated unduly by leisure-class ideals, the other by utilitarian considerations, is most regrettable in a country whose public-school system is maintained to nourish the ideals of democracy.

In the smaller cities and towns the practical aim of the high school too often is to keep on the accredited list of the university. In many high schools this dominating idea determines the subjects in the narrow curriculum and controls the work done in every one of them. This control looks in the direction of further work in the branches in higher institutions of learning and to indorsements of the standards set by them rather than to the clear comprehension of the subjects as related to the student's life and environment. Hence it follows, as stated by the Massachusetts Commission on Industrial Education, that the best energies of thousands of our young people are devoted to studying the language, the literature, the wars, the politics, the religion, the customs, and superstitions of peoples for fifteen centuries dead, while the knowledge that is needed to earn a living, to discharge the duties of citizenship, and even to appreciate the world in which we live must be picked up largely outside of school and by methods more or less irregular and ineffective.

THE TEACHERS

The conscious aim of the high school determines the choice of teachers. If the one function of the high school is to fit for college, what more sensible than to secure as teachers men and women who have been thru college and know what preparation will be needed? The insistence upon a high standard of scholarship is altogether praiseworthy. The error lies in not

recognizing the equal need of professional preparation, and in the particular sort of scholarship prized in high-school teachers. It is the knowledge of the classroom rather than the knowledge that flows from the arts and affairs of the practical world.

From this cause it results that the high-school teachers are nearly always college graduates, usually young college graduates with little or no professional education or ideals, no adequate comprehension of the meaning of education, of the purpose of the school, or of the physical or psychological laws that must govern all learning and should govern all teaching. To such teachers, "to get an education" is to complete a college course, and the function of the high school is to fit boys and girls for college. Naturally they imitate their own teachers and bring the methods of college and university into the high-school classrooms, diluting them to suit young students and lecturing much. Hence the instruction is scholastic, bookish, abstract, with little articulation with the environment or reference to the needs of modern life.

THE REMEDY

The first need of the high school is a change of aim. It must confront the actual needs of life as found in shop and store, in farm and home. This does not mean that all instruction shall be vocational; the physical, social, and cultural needs of men and women are facts of life. But it does mean that we must assess with greater care the actual educational value of every study in the curriculum, of every detail of organization and method, and conduct our schools in such a way as to secure the maximum of useful knowledge, skill, power, appreciation, and character. To make such assessment of values is no easy matter. We lack a universally accepted standard. We are likely to be misled by prejudice, by habit, by traditional doctrines of formal discipline intangible and unprovable. Subjects are of unequal value for different individuals and for different localities. No weighing of educational values can be universal or final.

Then our organization and instruction must be in close articulation with the local environment; partly because the natural objects, industrial processes, and social organization there must provide the concrete basis for vital instruction in many subjects; partly because the mastery of that environment is the proper sort of education for most of the students. In spite of the numerous exceptions in our restless American life, it is still true that most of our students will live in the locality where they were reared or in a similar environment elsewhere. The high school must not assume that it is the sole educational agency, its curriculum the sum of all worthy knowledge, and adopt a policy that prevents young people from acquiring arts and knowledges that must be learned in youth if learned at all. Thus if the high school does not offer instruction in instrumental music, it must find a way to supervise and credit good private

instruction and count it for graduation. If the student of domestic science has regular home duties in this field for which the school instruction affords direction, some means should be found for accepting such laboratory work, rating the excellence of the performance, and crediting the same on the high-school record. The school must not set itself up as the one institution that shall bend everything else to its calendar and needs.

Such a change of aim is not easy to bring to pass. The university looms large above the horizon of our country town. If the rival village ten miles away has had its high school accredited, we cannot afford to live in manifest inferiority. Our school board scurries about, telegraphs for the university high-school visitor, and begs him to name the terms on which the coveted relation may be secured.

In every country town there are a few influential citizens of the well-to-do, or professional classes who wish to prepare their children for college. Disliking to send their boys and girls away to boarding-school, they bring all possible pressure upon the school board to place their high school on the accredited list. It is not easy for a school board to resist this pressure even tho itself holding a more rational view of the function of the high school. For these and other reasons, the smaller high school (and it is from the smaller high schools that most normal-school students come) feels obliged to shape its program and organize its work with reference to college preparation.

A SPECIAL PROGRAM OF STUDIES

The second need of the high school is the change in the curriculum—in the interest not merely of future teachers but of all the students. In the small high school where but one program of studies is taught, it should not be the program prevailing at present. If the best single curriculum is arrived at, it will not be a poor curriculum for future teachers, for it will be a curriculum providing a large place for vocational studies and adapted to the cultural needs and resources of the community.

The high school holds in our educational system a place that is all its own. Its justification is that it is adapted to the immediate needs of the community. It does well when it does the best it can under the limitations imposed by the financial resources at its command. It is not a fitting-school as its chief function, as it is an end in itself rather than a station whence transportation is taken elsewhere. The universities, the colleges, the normal schools, and the technical schools must adapt themselves to these conditions, rather than expect perfect preparation for their specific field.

Our strictures upon the dominant ideal of the older type of high school must not be taken as evidence that we are seeking to substitute the dominance of the normal school for the dominance of the university. The normal school as such has no "needs" of its own. Its sole function is to make the public schools more efficient. Their ideals must be its ideals.

In the large high schools where various courses are now provided to meet varying tastes and vocational needs certain studies may properly be recommended to all who look forward to the vocation of teaching. In every state in the Union there are more teachers than there are physicians, lawyers, or engineers, and the professional life of the individual teacher is much briefer. More high-school graduates enter teaching than any other calling with a recognized demand for special preparation. The larger high schools provide special courses for future lawyers, bankers, and engineers; why not for future teachers? It is by no means necessary or even desirable that all elementary teachers should have followed the same high-school program—any more than that all the sixth-grade teachers in a city should be of the same relative ability in the various branches taught. The school system is all the richer because of the individual talents of each. Nevertheless, as appears below, there are certain arts and knowledges of high importance to all elementary teachers for which an adequate foundation should be laid in the high school. All intending to become elementary teachers should include these studies in their high-school curriculum, for a two-year normal-school course cannot afford time enough to master them.

The question arises, Do high-school students decide to become teachers early enough to affect their choice of studies? The general opinion is that they do not, but I am not sure that this opinion is in many cases based on actual investigation. In one large normal school 23 of the 26 women of the faculty had decided to become teachers before they were 16. A majority of the students in the same institution had decided at that age. In another state normal school all the high-school graduates were polled with this result:

37 per cent had decided to become teachers before entering the high school.
4 per cent during their first year.
4 per cent during their second year.
14 per cent during their third year.
22 per cent during their Senior year.
19 per cent after graduation.

Of 27 women in the faculty of this school 8 had decided to become teachers before they were 10 years old; 9 others before they were 16. Of the 23 men in the same faculty 10 had decided before they were 16.

From this it appears that by the middle of the high-school course enough students have chosen to become teachers to make it worth while to offer any needed courses. This number may be largely increased if high-school teachers take a lively interest in the future of their students. An observant teacher cannot fail to note among his pupils those who have a marked fitness for teaching. A word of suggestion or encouragement at the right time will often decide the matter. It ought to be somebody's business to advise young people as to what they shall do after leaving

school—somebody's who knows the young people and knows the world. A wise teacher often can do this better than the parents themselves.

From the reports received it appears that the high-school curriculum thruout the country contains substantially the same elements but varies somewhat in the relative time devoted to the different branches of study. The standard graduation requirements are usually 16 units, each unit being a year's work in a subject with daily recitations. An approximate composite of the various programs actually completed by the high-school graduates in the normal schools reporting is as follows:

English, including grammar, rhetoric and composition, English literature, reading and public speaking	3.8 units
Foreign languages—Latin, Greek, German, French, and Spanish	3.4 units
Social science—history, economics, civil government	2.6 units
Mathematics—algebra, geometry, trigonometry, and arithmetic	3 units
Physical science—physics, and chemistry	1.2 units
Biological science—zoölogy, botany, and human physiology	.8 unit
Earth science—geography, physiography, geology, astronomy	.6 unit
Music—vocal or instrumental	.2 unit
Drawing, design, manual training	.3 unit
Agriculture and household science	.1 unit

In the East foreign language has a larger place, often constituting a full third of the curriculum. In the South the ancient languages and mathematics receive larger relative attention. In the Middle West and also in the Mountain and Pacific states larger attention is paid to the biological sciences. Drawing and design seem best developed in New England. Agriculture and the household arts are just beginning to appear in ratable amount in the high-school curriculum of a few students.

The normal-school faculties reporting are pretty well agreed that for future elementary teachers there should be less foreign language, less algebra and geometry, more arithmetic, more biological science, more geography, more of drawing and the other manual arts, more music, reading, and public speaking than we ordinarily find in the high-school course.

Our students before completing the normal-school program are usually of the same opinion. In an Illinois normal school, 162 students, all high-school graduates, were recently asked how many would change their high-school courses if the course was to be begun with their present estimate of educational values to the future teacher. Fifty-six per cent (mostly Seniors) would change the course; 44 per cent (mostly Juniors) would not; 45 per cent would take less Latin, 11 per cent less German, 18 per cent less mathematics; while 39 per cent would take more natural science.

The following program is suggested as an elective program in our larger high schools—not as a finality, but as a better balanced assortment of our present high-school studies than is commonly chosen by future elementary teachers.

Three years' work in English.
Four years' work in science.
Two years' work in mathematics.
Two years' work in history and civics.
Two years' work in Latin, German, or French.
Two years' work in industrial lines.
One year's work in music and drawing.

VITALIZED INSTRUCTION

The third need of the high school from the standpoint of the normal school is that the instruction in the various branches be more thoro and more vital. There is a general complaint that high-school students are poorly taught, that they cover too much ground with little drill and real assimilation; that they have low ideals as to what thoroness and accuracy mean in the preparation of lessons; that their work is largely memorizing statements they do not understand and soon forget; that they do not know how to study; that they are poor in vocabularies and seem to lack words to express ideas with which they must be perfectly familiar. The fundamental difficulty seems to be, as pointed out before, that their high-school study is largely a thing apart from their daily life experience. They do not properly comprehend, appreciate, or assimilate the material they deal with.

Thus English is the medium of instruction. Habits in the use of English are forming in every classroom. Hence if students are to use the English language effectively with correct idiom and pronunciation, it will be brought to pass most economically, not by adding more courses in English, but by paying due attention to these points in every class. Every effort made to secure precise and orderly thinking not only aids in the knowledge of the particular branch but makes for better English as well. The inverse statement is equally true. Every teacher should be consciously a teacher of English.

Teachers especially need to be good readers, they must speak with ease and effectiveness and in pleasing tones. They should be practiced in story-telling and platform speaking. They should have read widely in literature, largely in children's literature, and have committed thousands of lines to memory. The normal course is altogether too short for this accomplishment. It should have begun in the lower grades, and have continued all thru the years of the high school.

The sciences should be so taught that the student will feel every day that his health, his happiness, and his success in life depend upon the truths they contain. They should explain natural phenomena and industrial processes, fuels, foods, sanitation, and the rules of right living. Altho the sciences came into our high-school and college programs largely as a protest against the old classical education with its emphasis upon formal discipline, its dependence on authority, we have gradually come to teach

them as if their chief value lay in their method; in experiments to rediscover what the student knows in advance, in the verification of physical constants, and in the solution of endless problems in energy and motion. For the same reason biology should deal with the visible forms that surround the student and which should appeal to him every day, rather than with the microscopic world.

The mathematics of the high school needs thoro revision. No other branch is so universally studied as algebra and with so little real profit. The time devoted to it should be reduced to one year, its topics limited to those that generalize and extend arithmetical processes. For the ordinary elementary teacher imaginary roots are as incomprehensible and useless as the fourth dimension. The work should abound in concrete problems. Investigations that do not begin in concrete problems and end in concrete applications should be omitted. A year of plane geometry, with many practical arithmetical problems involving geometrical elements, should suffice in this branch.

History should undertake to answer this question: How did our present institutions come to be as they are? Only in so far as they answer this are events or the lives of men worth knowing. Civics is a study of rights and duties in society. It deals with the co-operative efforts of men in the state to secure justice, protection, healthful conditions, education, and sundry other things of everyday value. It should emphasize function rather than structure and machinery. No study in the curriculum is of higher value than economics. Without it the organization of modern industry cannot be understood or rightly adjusted. It deepens the student's interest in life, and awakens his public spirit as no other subject can do. But to be of value it must be taught in terms of the student's environment.

Where the normal-school course is only two years in length, it is best in the high school to omit foreign language altogether and include in the last two years a study of the common branches—not a review in the sense of going over grammar-school textbooks, but a fresh study of these subjects from a higher standpoint, a study that will enlist the best energies of advanced students. A year of physical and commercial geography will set forth the conditions, purposes, and methods of human industry. Grammar is rarely appreciated by the fourteen-year-old. It really belongs to the Senior year of the high school.

PROFESSIONAL TRAINING FOR TEACHERS

The fourth need of the high school is a different standard of preparation for its teachers.

Thirty years ago mature and scholarly teachers who had served an apprenticeship in the grades were frequently promoted to the high school. They brought with them a knowledge of children, thoro familiarity with the common branches even in their higher reaches, skill in teaching. To

teach the younger classes in the high school such teachers are needed today. Instead of these we find in the smaller high schools, from which most of our normal-school students come, a shifting corps of young, inexperienced, and untrained teachers, college-bred young women usually with little definite knowledge of what goes on in the grammar school. The break between the grammar school and the high school is too pronounced. The pupil finds a new organization, new branches of study, new teachers with new methods of instruction. Teachers and pupils share in a mutual misunderstanding.

All high-school teachers need as thoro professional preparation as elementary-school teachers. They need the same knowledge of the laws of the developing life of children and youth, of the psychological processes involved in all learning, of the principles and methods of teaching and school management, of educational aims and educational values, of the relation of the school to other social institutions. Many superintendents testify to the fact that whereas elementary teachers usually enter heartily into the work of reading-circles, teachers' meetings, and other means of professional growth, high-school teachers stand aloof. They will co-operate in literary clubs and scientific societies, but they do not seem to realize the existence of a great body of doctrine that informs and illumines the teaching art. They are thoroly committed to the dogma, so widely prevalent in university circles, that anyone who knows a subject can teach it.

We therefore hold that in selecting high-school teachers, school authorities should give due weight to professional education and training as well as to character and scholarship, and that teachers of extended experience, acknowledged skill, and ample scholarship gained thru private study should not be excluded from the high school because of the lack of a degree. There is a good deal of superstition in the reverence paid to degrees. A degree is not a sacrament. It is not the outward and visible sign of an invisible and inward spiritual grace. There are teachers of slender school advantages who have, thru private study, reached a finer and truer scholarship than is attained by many graduates of our colleges and universities.

It is notorious that the significant advances in science and the arts have not been made by men within college walls. The greatest teachers of men have often owed little to the schools. May it not be well to make some sort of provision by which the Franklins, the Faradays, and the Edisons of the educational world may bring their ministry to the teacher's desk.

Altho this report has set forth what your committee believe to be common shortcomings of high schools, it must be not inferred that we hold the high school chiefly responsible for poor work done by graduates of normal schools. The normal schools are not universally what this report demands. These institutions need to examine their own organization, curricula, faculty, and methods. Their teachers are too often chosen because of

their degrees rather than because of their personal power and skill in the classroom. Often these teachers have had no real professional training; their experience as teachers before obtaining their doctor's degree is sometimes a record of failure. The actual classroom work in some normal schools is, outside of their training schools, but little better than that of high schools or colleges. The teacher recites most of the time. Pupils are nagged and growled at in pretty much the same old way. In many classes pupils are passive recipients rather than active participants. The science and art of questioning is wholly disregarded. May not the high schools retort to our strictures that they are greatly handicapped by the poor instruction given by normal-school graduates in the elementary school? A further inquiry into the question, How may normal-school faculties improve the quality of their teaching? may properly supplement this report.

Respectfully submitted,

Committee

DAVID FELMLEY, Normal, Ill.
JOHN H. PHILLIPS, Birmingham, Ala.

DISCUSSION

JOHN H. PHILLIPS, superintendent of schools, Birmingham, Ala.—It will no doubt be noted that the report has been considerably modified since its preliminary statement was heard at San Francisco one year ago. With a few minor exceptions the report appears acceptable.

Its strenuous tone in dealing with the dominating influence of the college over the high school might lead the casual reader to infer that the committee would like to substitute the normal school for the college and the university as a dominating influence in secondary education. Of course, this is far from the committee's intention, and a modification in the form of statement may remove this objection.

The influence of the college is doubtless too dominant today in many of the smaller high schools, altho it has been greatly modified within the last few years. We must remember, however, that no matter whether the dictation comes from the college or the normal school, the response must come from the people who after all control the high school. The demand of the college for high-school preparation in Greek has long since failed to arouse any response in the high school; "college influence" has not been dominant enough to restore Greek to its former place in the high-school course.

I am heartily in favor of placing more emphasis in our secondary courses upon the practical subjects mentioned in the report, and believe that every college should recognize such topics in its entrance requirements. Indeed many of our colleges now give credit for any work credited for graduation in any good high school. In speaking of vocational studies, however, we are in danger of restricting the term "vocational" to too narrow a definition. It may not be difficult to show that, for many people at least, the study of Latin may have an important vocational value; especially is this the case where a com-

fortable and practical knowledge of good English is desired. The value of the latter is properly emphasized; it is difficult to see why the former may not be taught in such a manner as to become the means of good English instruction.

It is true that in some of our larger cities, the older high schools have assumed as their function the fitting of students for college, while the newer manual-training and commercial high schools in the same cities are set apart for those who do not expect to enter college. The inevitable result is a social cleavage inconsistent with the spirit of our democracy. These different types of schools should be combined; the student in the college preparatory course needs the industrial and vocational atmosphere and vice versa. We do not wish to discourage college preparation in our high schools, nor do we think it desirable to create a chasm between the two classes of students by their unwise separation.

The report has been written from the standpoint of the best type of normal schools in this country. But it must be remembered that the number of normal schools whose academic curricula are equivalent to those of the college are very few. It is not surprising therefore that high-school teachers are required to be college graduates rather than normal-school graduates. It will be conceded that the academic scholarship accepted for graduation in a large number, if not in the majority of the normal schools of this country, is but little in advance of that required for graduation in our best high schools. Our high schools should be commended, therefore, for adopting for their teachers the highest standard of scholarship available. But "college graduation" is too restrictive. College education or its equivalent, together with a good professional course, would be a more adequate statement of this indispensable high-school requirement.

I feel also that the report in some of its statements is altogether too strenuous in dealing with the alleged weakness of the high school. In this respect the critical attitude of the normal school is so obviously similar to that of the university that comment is unnecessary. Both should remember that neither is quite so democratic as the high school, and that neither is likely to respond so readily to the heart beat of the great public, upon which all must depend for their patronage and support.

With these slight modifications I am prepared to indorse the report.

J. Stanley Brown, principal of Township High School, Joliet, Ill.—Dr. Felmley has made many changes in his report since the St. Louis meeting, but he continues to adhere to the statement that the conscious aim of the high school is to satisfy the college requirement. Later in his discussion he states that this conscious aim is very largely confined to the smaller high school, but that from these smaller high schools comes the largest percentage of normal-school students. The conscious aim of many of the small schools is doubtless what President Felmley has stated, but the aim is in many cases a rebellious aim even tho conscious.

Many high-school principals and superintendents would gladly modify their courses of study so as to meet more nearly the needs of their communities, if the economic conditions of those communities permitted such action. It is a well-recognized fact that it costs much less to teach Latin, mathematics, English, history, modern language, than mechanical drawing, manual training, domestic science, stenography and typewriting, physics, chemistry, biology, and other laboratory studies. For this reason there has been an unconscious clinging to the single curriculum composed largely of these studies whose cost is less than other studies.

It has so happened that many of the college-entrance requirements, especially those of the earlier type of institutions, were determined at a time previous to the introduction of the newer studies. This we think an important element and one which must not be lightly passed over when we consider the studies of the curriculum and the number of courses offered by the high school.

Another question which President Felmley raises is with reference to the time when

high-school students decide to become teachers. An investigation would lead us to think that a very considerable percentage make this decision before entering high school. He passes over the fact that while the boys and girls in the eighth grade have decided to be this or that, or to do this or that before entering high school, during their first year of the high school they decide to do something else, and probably during their high-school course they will have reached three or four different decisions. We think that these conditions are probably normal and that most boys and girls in high school, and even in college, change their aim and purpose from time to time. An investigation among adults or those in middle life in any community will reveal the fact that there have been from two to six changes in occupation from the age of fourteen to the age of twenty-five. This fact makes it all the more difficult to prescribe absolute limits in choice of work during the high-school period, and would seem to indicate that a general course of study, not specifically designed for one wishing to enter normal school, would be best.

We agree with President Felmley that vitalized instruction is very necessary in the high school. We would suggest, too, that this might have equal value in the normal school and college.

We are in hearty agreement with what President Felmley says about professional training for teachers and shall gladly welcome the time when the universities and teachers' colleges, from which source must come the high-school teachers, shall give an abundance of professional training for such high-school teachers. It is certainly true that the high-school teachers need as thoro professional training as any other type of teachers and that boards of education ought to give due weight to such professional preparation. Other things being equal, we prefer high-school teachers who have had at least enough training to get a degree from an institution of good standing.

All in all, the report seems to us to be a valuable report and after the few changes which we have indicated have been made, we shall gladly indorse it.

Homer H. Seerley, president of Iowa State Teachers College, Cedar Falls, Iowa.—It seems necessary to say a word in defense of the main propositions of this report. There can be no desire for the normal schools to wish to dominate the high schools, thus taking the place of the universities in the attempt to improve the school system. The true normal school does not believe in domination, it believes in freedom for each class of schools; it would leave the high school free to perform to the best of its ability its highest service to society. There could be no benefit from such domination, even if it could be accomplished. The whole object of this discussion is to ascertain from the point of view of the normal school, in what respect the high school could contribute to the making of competent teachers. No other vocation takes as many high-school graduates annually as does teaching. That being so, it seems reasonable that the normal schools are justified in asking the high schools to remember what a large contingent of their enrollment will prepare to be teachers and give them a little better preparation than the prescribed courses permit. This is certainly a reasonable proposition and no one should take exception to the chief attempt of the committee.

All of these kinds of schools have a place, and a useful place at that, in the system of education, and none of them should be disparaged or repudiated. The normal schools are statutory institutions. They were created by the states to meet an urgent demand. They did not originate as colleges and universities have, as their province was determined by law. The work they try to do is very difficult. No other kind of an educational institution has passed thru such a fire of criticism. Yet their history of development, improvement, and expansion is one of the most interesting phenomena of the past fifty years, an evidence of the fact that they must be consulted as to educational policies, since they have right claims upon the high school. Their development is exceeded by only one other kind of educational institution, the high school. It is marvelous what fifty years have done in the erection of massive buildings, in the remarkable equipping, and in the improving

of the teaching force of the high schools. There is no prouder chapter in our educational history than that of the high school.

The normal school has no controversy with the college or the university but it has the right to ask these institutions to do their part toward helping perfect a school system. The normal school goes to the college or the university for its teachers and its experts. There is no other place to go, as talent and scholarship and capability are essential to the normal-school faculty and those higher institutions attract such persons and train them for excellence and usefulness. Hence the normal school respects and esteems the university for what it can and should do for civilization. These several institutions are not in each other's way, they are not contestants in the great field as they are coworkers and co-operators for the common good. There is more than room for them all and they should each display the spirit and the attitude of workers for a better time with better results in the education of the children and the youth.

JOHN W. COOK, president of Northern Illinois State Normal School, De Kalb, Ill.—Dr. Phillips objects to the verdict of these normal-school students with regard to their high-school course, on the ground that they are not qualified to pass a discriminating judgment. His objection would be valid were it not for the fact that many of these students have been teachers for several years and are not immature and inexperienced as he regards them. Instead, what they have to say should be received with genuine respect. Not only have they done the practice work required of them in the course of study, but many of them have such maturity and experience as to enable them to come to just conclusions respecting the value of the ordinary curriculum in the high school when looked at from the point of view of the prospective teacher.

I find myself quite thoroly in accord with Dr. Felmley in the presentation of his case. It is an admirable piece of work and ought to have a decided influence in the liberalizing of the high-school course. There may be a suggestion of narrowness in beginning preparation for teaching at so early a period but it may be said in answer to such a suggestion that the proposed subjects are perhaps as liberalizing as those would be that are omitted. I cannot quite agree with him in regard to the study of Latin. I am convinced, however, that there should be a material change in the methods of instruction in that subject. I find that the average high-school graduate, with an experience of four years in the study of Latin, has very little acquaintance with the etymology of our English words derived from that language. It must always be true that the study of words will form a large part of any school curriculum. It is easily possible to make the study of Latin contribute immensely to the power of the student in dealing with his mother-tongue. The early work seems still to be devoted to the acquisition of an acquaintance with construction at the expense of the content, and the significance of roots. If the shade of Julius Caesar should enter the classroom and observe the ordinary processes employed in teaching his *Commentaries* he would doubtless ask himself, "Was it for this that I conquered Gaul?"

I should like to add to the curriculum suggested by Dr. Felmley a thorogoing study of reading—ordinary reading. At least one semester, of two or three periods a week, could be used most advantageously in rigorous thought analysis and equally rigorous training in the selection of suitable forms of expression for the ideas contained in the text. I am well aware that few high-school teachers seem competent to conduct such exercises. They may fit themselves, however, for proper instruction and the results of such a course of training would be extremely gratifying. A new and unusual interest would be awakened in literature and especially in that fine art of expression in which we are so unfortunately weak. We enlarge upon the value of singing, but as between the possession of that desirable art and the art of genuinely good reading few would be found who would not award superior value to the latter.

REPORT OF PROGRESS OF THE COMMITTEE ON RURAL SCHOOLS

E. T. FAIRCHILD, STATE SUPERINTENDENT OF PUBLIC INSTRUCTION, TOPEKA, KANS.

(For report see papers of the St. Louis meeting of the Council.)

DISCUSSION

ADELAIDE STEELE BAYLOR, State Department of Education, Indianapolis, Ind.—While the rural schools and indeed all of the schools of Indiana, as Mr. Brown has said, have benefited greatly by the minimum wage law, yet it has a weakness, in that it does not provide for the experienced teacher. Because of the wages that must be paid the young teachers, this piece of legislation has made the profession very inviting in its early years. But there is no scale established by it, enforcing the payment of minimum salaries to teachers with a longer experience than three years. The scale stops with the third year, and it is possible for teachers of long experience and careful training to receive the same wage as those who have been in the profession but three years. Consequently a surplus is found among those entering the profession, but there is a deplorable scarcity of mature, experienced, able men and women. These have dropped out for more lucrative employment.

All schools have suffered, but especially the rural schools, since the city schools refuse to take the inexperienced teacher and she is forced to spend her first years of teaching in the country. Her heart and interests are in the city. She does not care to remain in the community in which she teaches longer than is necessary to do her required work. If she can return to the city each night, she endeavors to do so.

A vigorous campaign is needed in the interests of rural schools and communities that will make the life so inviting to the teachers, they will identify themselves more largely with the community in which they work.

Consolidation of schools will add to the improvement of rural conditions by increasing the tenure of office and salaries of teachers, and providing commodious, well-equipped buildings in rural districts for the education of the rural boy and girl. But consolidation like all other new movements must be taken up advisedly, and the subcommittee on consolidation, a part of the committee from this body on rural education, must make its investigations and reports, it seems to me, not so much along the lines of argument for consolidation as along those of investigating how schools have been consolidated, under what conditions consolidation has proved better than anything else and under what conditions the schools have prospered more by not consolidating at all.

The members of your Committee on Rural Schools, as the chairman has well said, are not here to discuss the work of the committee, which has had little time for anything but a small beginning, but rather to ask your advice and suggestions for lines and methods to be followed out that the results of their investigations may produce conditions, everywhere in rural districts, as good as those in Indiana—yes, far better than those in Indiana.

EDUCATIONAL PROGRESS OF THE YEAR

J. A. SHAWAN, SUPERINTENDENT OF SCHOOLS, COLUMBUS, OHIO

Progress is not always marked by innovations: New movements are in the direction of progress only as they prove themselves helpful and necessary to the success of the cause to which they belong. In education as in everything else, many experiments are futile and lead to nothing.

Yet he who would seek the truth must try many things. Like the astronomer, he must sometimes focus his instrument thru the open slit, shutting off everything else so that he may see more clearly by concentrating his vision on the one object. There are a few who belong to this class and who are sounding the height, depth, and breadth of many educational principles.

Education is yet in its flux. All truth has not been discovered, all problems have not been solved. The specialist may continue to investigate and analyze, and the administrator continue to enlarge his horizon. By a change of viewpoint, the administrator may find that his neighbor has a vision of truth that he himself never suspected; by another change, a much clearer grasp of the situation is obtained, and so on *ad infinitum*.

It has been and will continue to be the mission of the National Council of Education to afford these different points of view and to declare from time to time what the truth in education seems to be. Truth itself is infinite and unchangeable. We do not see it all at one time. If, like the great planets, it sometimes seems to retrograde, it is no fault of the truth, the apparent motion is due entirely to a change in our own point of view. If in our haste, therefore, and before we have seen clearly we find ourselves moving away from the truth, a back movement on our part would be prudent and right. This has often been made in educational matters and some school systems have found it difficult to recover from their retrograde motions. Eternal vigilance is the price of educational progress.

I am indebted to Dr. E. A. Jones, of Otterbein University, for some valuable facts gathered by extensive correspondence and investigation and used in a recent address before the Central Ohio Schoolmasters' Club and showing the year's progress in the state of Ohio. I take it that this is typical of what might be expected in other states, if time were given to a careful investigation and study of conditions:

PUBLIC SCHOOLS

"The last report of the state school commission shows an increase in expenditures of about $2\frac{3}{4}$ millions over the preceding year; an increase of 54,795 pupils; 28,023 teachers as against 27,841 in 1910; 238 new buildings were erected at a cost of $5,149,062; average salary for rural teachers in elementary schools, $56; and in cities, for men, $88, for women, $67. This shows a slight increase over the preceding year. The number of centralized and consolidated schools is given as 186, a gain of 15 over 1910. Of this number 50 are completely centralized.

"No doubt the introduction of agriculture into so many of our high schools and improved methods of teaching it have had a good effect. If agriculture is taught in a practical way thru school and home gardens, and the field plots, instead of from books entirely, botany will be better taught, physics will be better taught, and perhaps even mathematics may feel the influence.

RURAL SCHOOLS OF OHIO

"Ohio has many excellent rural schools, township high schools, centralized schools, and even subdistrict schools that, in respect to buildings, fine surroundings, superior teaching, advanced methods, and good equipment, will compare favorably with similar schools in other states in the Union. At the same time it must be admitted that there are yet in Ohio a good many rural schools that are a reproach to the state. An examination of the notebooks of our school inspectors will reveal the fact that in many districts there are dilapidated buildings, miserable outhouses, unsightly surroundings, unsanitary conditions, no course of study, inefficient teachers, antiquated methods, and out-of-date textbooks. There is nothing to attract and interest, much less to inspire, the children. Much attention has been called to these backward districts during the last year thru educational journals and the public press. This publicity may have a good effect. It should awaken in these districts a public sentiment that will lead the citizens to elect a board of education that will change these conditions and give to the children the educational rights to which they are entitled. What is needed in country districts is more of centralization, more trained teachers, and an extension of intelligent and helpful supervision until it reaches every township in the state.

"In the statistical report of the commissioner, a great gain is shown in the number of pupils taking manual training and domestic science. In 1910, 39 counties reported 4,023 pupils in manual training and 2,172 in domestic science. In 1911, 59 counties reported 16,236 in manual training, and 12,797 in domestic science."

This indicates to some extent the educational trend in Ohio.

Progress is not measured by the number of new enterprises undertaken. The year just closed has not been specially noted for its new movements in education but in my judgment has been noted for the careful study of those in operation and a cold analysis of the results obtained.

Note the subjects studied by the special committees appointed by this Council and submitted at the San Francisco and St. Louis meetings:

1. The report of the Committee on a System of Teaching Morals in Education, with able treatment of the different phases of the problem by superintendents Brumbaugh, Carr, and Greenwood, in itself has been a most valuable contribution to the cause of education. It was not a new movement but showed thoro study of internal conditions and carefully considered plans for their improvement.

2. The Cultural Element and Economy of Time in Education.

3. The Improvement of Teachers in Service in City Schools: Including: (1) High-School Preparation of Candidates for Normal Training; (2) Needed Adjustment between Secondary Schools and Colleges.

4. Problems Relating to the Health of the School.

Similar subjects have been under discussion by the General Association of the National Education Association and its various departments, to wit:

Our Educational Progress and Improvement in the City, in the State, in the Nation.
Organization as Affecting the Course of Study and Economy of Time.
Various conditions affecting school efficiency, etc.

These were discussed in the Department of Superintendence and indicate the trend of educational thought during the year. But merely to enumerate these topics would take too much time and space. All are intensive rather than extensive—an honest effort to make good in present enterprises rather than to multiply new enterprises.

ELIMINATION

We frequently hear it said that the schools are attempting too much and this may be in a measure true. If so, it should be and will be corrected and this Council should be the great clearance-house where all such problems are disposed of. The setting of standards that may be advanced with our ideals is the greatest forward movement possible.

It is interesting to look back over the courses of study which our grandfathers prepared and our fathers pursued. There is one before me now which was in use in a certain city forty years ago. Note: sixth, seventh, and eighth grades—reading, writing, arithmetic, English grammar, English composition, geography, history, constitution of the United States, algebra, bookkeeping, with memory as the principal faculty developed.

All that has been added in these years has been physical exercises, which come as a relief; physiology, a few minutes once a week; and domestic science or manual training, which occur once a week. All of these have the effect of relieving the tension due to close application to book studies. As an offset to the above additions to school work, has come the studied elimination of obsolete and useless materials in all subjects, particularly in arithmetic, grammar, and geography, and the use of better methods and an appeal to thought. To know what is important and just how much emphasis to put upon certain facts is the truest test of a great teacher.

Everywhere during the past year, the relative value of materials used with the selection of those which are of most worth has been the watchword. True, this is only the echo of what our great leaders have been preaching for a score of years or more, yet, like the thunders reverberating among the summer clouds, it is necessary to keep the educational atmosphere clear.

The study given by our secondary teachers to the essentials in their respective departments also marks substantial progress. The report prepared and printed for general distribution on the teaching of geometry must serve to standardize, at least to unify, the teaching of this subject.

CONSERVATION OF VISION

At the Boston meeting of the *National Education Association* a committee was appointed by the Department of Special Education to investigate and report on the status of the conservation of vision. As the

committee entered upon this work the field rapidly enlarged. The question of artificial as well as natural lighting, the conditions in workshops and factories, ophthalmia neonatorum, in fact, the steps that may be taken to prevent blindness as well as the conservation of vision, all were discussed before the committee.

A lady representing the interests of a body of sewing girls in New York City came before the committee and claimed that the light was insufficient in many shops and factories even to see the eye of a needle, much less to thread it. She thought that a standard of light should be fixed to meet such cases. This was beyond the field of work outlined by the committee, which wished to confine itself to the lighting of schoolrooms, the character of the printed page, and the limitation of work having too much eye-strain.

The work of the committee, however, led about one year ago to the formation of the American Association for the Conservation of Vision which has received substantial encouragement and support from the Russell Sage Foundation.

The conservation of the other senses has been receiving thoro consideration during the year, and a revival toward a careful development of the sense of touch bids fair to serve as a great relief to the overstrained nerves where defective vision and defective hearing obtain.

The passage of the new star, Montessori, across our educational horizon during the past year, as seen thru the magazine telescopes and others, has attracted no little attention. While much that is used by this little Italian teacher is old and of slight value, the emphasis placed upon the individual, the training of touch, and the development of the muscular sense must be of incalculable value, especially to young teachers. I have no doubt that all that is good will be adopted by and adapted to our American schools.

RETARDATION AND ACCELERATION

Compulsory education has forcibly brought to our attention two classes of pupils—those who were compelled to attend school but could not keep up with the average child, and those who could do more than the ordinary grading required. These are problems of economy in school administration as well as affecting the internal workings of the schoolroom. Every group of 35 or 40 repeaters in the elementary schools and every group of 25 or 30 in the high schools calls for an extra teacher, an additional expense of from $500 to $1,000, in one case; and from $1,000 to $1,500, in the other. During the past year this subject has received more attention than any other school problem. Some of the best trained experts of the country have applied themselves to its solution, including the distinguished president of this Council.

It is but natural to look over our own fields of labor in gathering facts to be used on an occasion of this kind. Perhaps the most encouraging facts should come first. Statistics are not complete for the year just closed,

but for the year 1910–11, 410 pupils, or 2 per cent, completed two or more semesters more than the regular elementary grades to which they belonged. This means an entire school of 12 rooms with an average of 35 pupils to a room. On a basis of $600 to a teacher it also means the saving of $7,200 in school funds. No doubt like results would be found in all cities, and in many the ratio of saving would be much greater.

A few facts on the other side may not be uninteresting.

A study of the causes of nonpromotion for the present year under the new uniform report system shows:

That out of 22,000 pupils enrolled in the first eight grades, 12 per cent were not promoted, 88 per cent were. I am quite sure that a comparison with other cities will show that this percentage is very conservative—it is about the same as that of New York City. Of those not promoted, the causes as reported by the teachers were as follows:

23.7 per cent were due to irregular attendance; 5.7 per cent to physical defects; 8.9 per cent to personal illness; 39.3 per cent to mental incapacity; 22.2 per cent to indifference. As might be expected, the largest number of failures was in the first grade, almost one-fourth of the entire number, which is not of the most serious importance; the eighth grade had the fewest, only about 3 per cent of the whole number of failures; while the other six grades in the order of the size of number not promoted were the fourth, fifth, third, sixth, second, seventh. All tests show that the problems are found mostly in the fourth and fifth grades, followed closely by the third and sixth. Most large cities, particularly New York, are working out a system for their solution.

Teachers are not supposed to be experts in classifications such as the above, tho their study of the child will lead them remarkably near the truth. In matters of mental incapacity, they cannot be expected to differentiate closely between that which is wholly mental and that which may have a physical basis. The fact is that all of these causes of failure overlap and there should be someone who is specially trained and thoroly competent to analyze them so that each case may be handled in the most practical and economical manner, to the end that the swift may not be held back by the slow, nor the slow, discouraged, fall by the way on account of the speed of the swift. The question then is: To what extent is retardation due to mental, physical, and sense defects which may be improved, if not entirely corrected? We are apt in our enthusiasm to jump at conclusions and to think that we have found a cure for all of our ills and imperfections in some new scheme. While the cure may not be at hand in every instance, yet if a large percentage of the handicaps are discovered and, thru a proper co-operation between the home and the school, corrected, great good will have been done not only for the children concerned but for the future citizens of the community. The greater the reduction of the number of repeaters, the less the cost for general education and the greater its efficiency.

In view of these facts which confront every city school system, what can be done to solve the problem? This question has been raised, in practically every city of the country, beginning with the great centers of population like New York, Boston, and Chicago. Some have made great progress in its answer. That the teacher can and does do much goes without question, but that he should not be called upon to give the final answer to questions affecting mental and physical defects must be apparent to all. Too many problems of that kind already stand at his door. Where action is most needed his non-expert opinion would have least influence, if not indeed be considered an impertinent intrusion, an impression which should not be developed in the mind of the parent against the teacher. The teacher may suggest cases, but the final opinion of an expert is necessary to bring such cases to the serious attention of parents and guardians. When I speak of an expert, I mean an expert, not a person who merely needs the job.

There can be no question that the diagnosis of cases of mental deficiency leads to economy of administration and efficiency by the segregation of those who cannot keep up with regular classes in schools of their own where they can do such work and receive such help as they most need. Every school system has more cases needing such treatment than is realized.

In a psychological clinic made during the present year in our special school for boys, and in two of the individual schools comprised of pupils who were two or more years behind, the following results were shown thru the "Binet test." The 25 boys in the special school were on an average 2.27 years younger mentally than their natural age, tho many of them were quite normal; I do not mean retarded—I mean younger mentally; one of the individual schools, consisting of 21 pupils, averaged 3.13 years, and the other with 20 pupils, 3.95 years younger mentally than naturally, while a few were 5, 6, and 7 years younger mentally than naturally. No doubt some cities have done similar work long ago, but many have not. Such information ought to help in the solution of many problems. A child who is 7 years old mentally cannot cope with one who is 14. It ought not to be expected. Such cases should be segregated and treated differently. But who shall say that this one or that one grades low mentally? Here is where the teacher needs help. Only the judgment of an expert will be respected, a teacher's opinion would be charged to prejudice and a lack of sympathy and patience. Such children have been allowed to lag behind altogether too long. They should be given a helping hand. Some cities have solved this problem, but not all.

MEDICAL INSPECTION

Every American child is in a broad sense a child of the republic. Not that the republic is to assume the responsibility for food and clothing, because something should be left for parents to do; but every child is

entitled to every opportunity for prosperity and happiness which is given to any other child and under as favorable circumstances as the state can offer. The old doctrine, "Every fellow for himself," has become obsolete. A newer and better principle underlies modern patriotism: "Each for all and all for each."

The school has long since passed the stage of being an institution for the acquisition of knowledge alone. While not losing sight of this accomplishment, as we hope, it has boldly given itself to the proposition that education is a preparation for life and good citizenship, and that the school should be life itself for those who attend. The child does not know what he needs. Someone must think and act for him. Parents do not always know what the child needs and too often do not care—in such cases someone must think for them and, if necessary, compel them to act. The child has rights that must be respected and the welfare of the community demands that handicaps be lessened or removed and that the best that there is in each child be brought out.

Perhaps no movement in education has proceeded with greater momentum in the last few years than medical inspection. In 1900, comparatively few cities had considered the importance of this work; in 1905, 55 cities had undertaken it; and in 1910, according to the Russell Sage Foundation, no less than 400 had inaugurated systems of medical inspection, and the contagion has continued to spread. While largely the outgrowth of compulsory education, the systems have been founded on the principle that "sound health is vital to any community as well as to the nation."

That some mistakes have been made, there is no doubt. Standards have not been uniform and vast volumes of statistics have been gathered in many cities that are of no value. In many instances, inspectors have widely differed in their diagnoses of the same cases. All of this is to be expected when we consider the rapid growth of the movement and the lack of specially trained experts to do the work.

Maximum efficiency consistent with the preservation of health is a reasonable school doctrine. In the adoption of the following, this city of Chicago has taken an advanced position:

> Healthy children should be safeguarded against communicable diseases, while parents of defective children should be apprised of the truth sooner, and thus enabled to have their children treated before their weakness becomes chronic.

Each pupil in this city when he enters the schools in September will be required to file a certificate from the family physician stating that he is in good mental and physical condition. Those who do not do so will be examined by the school inspectors and any found to be mentally or physically defective will be segregated from the rest of the pupils. This may seem drastic but there are 350,000 young lives involved, many of whom are housed in all sorts of nooks and corners in this crowded city.

INDUSTRIAL EDUCATION

The report from the National Bureau of Education shows that there has been a marked tendency toward industrial education in city schools thruout the nation the past year. In 1911, the legislatures of nine states enacted laws with reference to some form of industrial training. These states were Alabama, Colorado, Indiana, Maine, Massachusetts, Michigan, Minnesota, Pennsylvania, and Wisconsin. Wisconsin created a state board of industrial education and provided for the establishment of vocational schools and of a school to train teachers in industrial subjects. In Ohio, a beginning too has been made and the year shows commendable progress. Technical and commercial high schools have been established in Cleveland, trade schools and a commercial high school in Columbus, a manual-training high school in Dayton, and we have the co-operative system and continuation schools in Cincinnati. The trade schools in Columbus have been very successful and the board of education has enlarged the scope of the work and will soon be compelled to provide more extensive accommodations.

The departments so far opened are carpentry, cabinet-making, wood-turning, machine shop, electrical shop, and print shop. The school has been in operation for three years. In June last, a class of two was graduated from the printing department, the first class, as far as we know, ever to have graduated from such a department in a public-school system. In connection with the graduating exercises a printing contest was held at which a committee of practical printers acted as judges and spoke in the most encouraging terms of the efficiency of the work. During the summer vacation, all of our trade-school boys have employment in the industrial shops of the city. The co-operative plan has been inaugurated and is proving successful.

Concerning the co-operative system in Cincinnati Professor Schneider of the University of Cincinnati writes:

> The co-operative course has now about three hundred students. During the past year a new engineering building was completed at a cost of $250,000, and with the increased facilities thereby obtained, much larger classes will be enrolled from now on; heretofore we have been restricted by lack of room. Courses are offered in civil, electrical, mechanical, chemical, and metallurgical engineering. About 75 per cent of our students are young men who could not afford to go to a college of engineering except from the money they earn in this course. All of them are high-school graduates with the necessary entrance credits. The interest on the part of manufacturers is increasing amazingly and we have many more requests for co-operation than we can take care of.

The work in domestic science and manual training is taking higher rank every year and the past year has been no exception, as facts already quoted indicate. There is little difficulty now in getting specially trained teachers for this work. This is particularly true in the department of domestic science, and since so much depends upon the teacher—his preparation,

personality, and enthusiasm—the future of these departments is well assured.

AGRICULTURAL EDUCATION

Removal from the farm to the city has become so serious in the past few years as to be viewed as a menace to our American institutions. The object in the establishment of agricultural colleges of the various states begun a generation ago and the adoption of agricultural courses in the common schools of recent date was to promote scientific farming and to check this tendency.

The passage of the Cahill bill by the Ohio legislature in May, 1911, is already having its good effects in that state. The state commissioner of common schools reports that thru the supervisors of that department excellent results are being secured. The textbooks on the subject are so in demand by the parents that the children are frequently unable to get them long enough at night to prepare their own lessons for the next day. The fathers become so interested in the subject that they frequently attend school for the recitation in agriculture, which acts both as a spur and inspiration to the teachers, as well as an encouragement to the pupils. The observance of Arbor Day for 1912 was in some places, it is said, like an old-fashioned Methodist revival.

One very interesting feature of the work is the enthusiasm and skill shown by a number of city girls in preparing themselves to teach this subject. The country girl too often thinks that she knows all about it and so depends upon her native knowledge. The city girl, on the other hand, finds it a new and intensely interesting field. What she lacks in experience she makes up in enthusiasm and her knowledge is fresh and up to date. She learns quickly how to teach this important subject to a farmer's son who is older than herself. The chemistry of the soil seems to her easy and natural and the use of lime as a counter-actant for an acid in the soil, she tests with success, thus giving practical demonstrations of what can be done with certain kinds of soil, multiplying their productive power many fold. Now, if a city girl can do so much, what might not a country girl or boy do?

If the study of agriculture will serve to strengthen the attachment of the sons and daughters of the farmer to the old home and result in greater productive power of the soil, the movement may well be regarded as one of the most important in the educational world of the present day.

VOCATIONAL GUIDANCE

This subject has received a great deal of consideration during the past year. Its importance can hardly be overestimated.

One by one great expressive terms representing the technique in education cross the stage of educational progress, occupy the center for a while, and then take their places in the list of actors to be called upon as the play

progresses. Thus "concentration," "co-ordination," "correlation," "motivation," "apperception," "self-activity," have come and taken their places in the vocabulary of the science of education. Some are used a great deal, some very little, a few have been slow to leave the stage, even after their part in the play was finished, but each has had its place. And now, "vocational guidance" is demanding and receiving our consideration. This is not a new idea but it has received new significance as industrial training has become more prominent. What shall a boy do that he may work out his mission in life? The old idea of putting him to work at anything which came along, no matter what, has not proven itself wholly satisfactory. A boy needs to continue at something and not to seek so many new jobs. Activity in any direction has its value, but activity in the direction of one's adaptability and bent is all important.

Simply because a boy can draw a picture, play a jewsharp, or take an interest in a sick dog is not conclusive evidence that he is destined to become a great artist, a great musician, or a great physician. These may indicate an amount of appreciation or adaptation but the facts are not sufficient for a final conclusion in choosing a vocation.

In our multiplicity of courses, many leading nowhere, there is great confusion in the minds of those who choose, and the line of least resistance is too often the determining factor.

The parent should not be relieved of responsibility in a matter of so great importance, but often himself needs information and guidance. The teacher is already working up to the limit of his capacity and his business is primarily to teach; yet he is interested in the pupils before him, discovers their powers and limitations, and, perhaps, learns better than anyone else the mental bent of each pupil. The principal or superintendent who has watched his boys pass from grade to grade is in a position to give most wholesome vocational advice. Three things are true:

1. Too many are passing out of our schools and away from our homes without any definite purpose in view and unprepared to do anything well.

2. With something definite in view, studies have a new interest, and life has a new purpose.

3. Service, the highest ideal of life, is emphasized and life becomes a mission, not merely a career.

Three things should be done:

1. A careful study of the pupils. If it is the province of the schools to make good citizens, someone in the schools should know what each pupil is good for.

2. Information along the line of life's callings—agricultural, industrial, commercial, and professional—should be at hand.

3. Frequent conferences by teachers, principals, and parents.

What is the use?

Commissioner Snedden, of Massachusetts, says:

Vocational training is one of the most important issues before the educational world, combined, as it always should be, with the necessary guidance to enable the pupil to

choose wisely the life-work in which he is most likely to succeed. Altho a satisfactory program for vocational work has not yet been wrought out, the recognition of the need of vocational training has now become quite general and much that is beyond the merely experimental stage has already been evolved.

In commenting on the above Dr. Jones, of Ohio, says:

Massachusetts in particular has accomplished a great deal during the year and Commissioner Snedden's reports on the subjects are encouraging. Evidently we are rapidly approaching the time when the vocational idea shall be not merely tacked on to our educational system or even ingrafted, but instead thoroly amalgamated with it.

Dr. Draper, of New York, in an address early in the year embodied this idea in what he had to say about educational ideals. After making a plea for "common honesty," he said:

Education that has life and enters into life; education that makes a living and makes life worth living; education that can use English to express itself; education that does not assume that a doctor must be an educated man and that a mechanic or farmer cannot be; education that appeals to the masses; that makes better citizens and a greater state—that is the education that concerns New York.

We believe that this is the education for America. To know is of inestimable value but to be able to do is a greater accomplishment. Knowledge and action should go hand in hand. As between the cultural and the industrial, a young man should be advised to choose both. During the past year many of us have been getting our good second breath in this matter. Culture and motor activity should and do complement each other.

TEACHERS' SALARIES

Considerable attention has been given in most cities and in some states to the question of teachers' salaries. In fact, a committee, appointed at the San Francisco meeting of the National Education Association is at the present time preparing a report on this subject. Speaking for our own city, for the past five years there has been an increase somewhere along the line each year. While this has not been large, not at all in keeping with the increased cost of living, it has been encouraging to our teachers.

We have been fortunate in having Dr. W. O. Thompson, president of the Ohio State University, as a member of the city board of education for the past six years. During practically all of that time he has been chairman of the Committee on Finance and has insisted upon better pay for the teachers and greater efficiency in the work. The tuition fund has been increased 37 per cent in five years.

OPEN-AIR SCHOOLS

About three years ago, the open-air school entered the educational field. It has gathered considerable impetus and during the year just closing has had its greatest momentum. Not only have these schools been a blessing to the anæmic and to those predisposed to tuberculosis but they have had an educational influence in the community. As a result, greater

attention is being given to the ventilation and lighting of the home and the school. Many states have passed laws fixing the standard of lighting schoolrooms as to amount, direction, and quality. Never before has ventilation, heating, and sanitation received the attention that now obtains. As a natural result, sensible decoration, cleanliness, and beautification follow. This is as it should be, for the æsthetic, the ethical, and the intellectual are a trinity that should never be divided.

UNIFORM REPORTS

The work of the Committee on Uniform Reports approved and adopted by the Department of Superintendence at its St. Louis meeting was a valuable contribution to the educational progress of the year. These are days of investigation—days when we seek and want to know the truth. It is far more important that we should find this out for ourselves in our own schools than that it should be left for commissions or committees to find it out for us, however much we might appreciate their approval or confirmation.

The primary object of this committee was to have reports prepared in a sufficiently uniform manner to make comparisons between different school systems fair and useful; but the effect upon the different systems of schools in making it possible to study their own internal workings from different points of view will prove more valuable than the outside comparisons.

As the schools have passed thru different stages of growth and development three steps should be noted:

1. At first, the one great question was that of growth, and statistics were of greatest value chiefly from that point of view. In those days the American common-school system was an experiment that had to be tried out and numbers were supposed to indicate the degree of approval. As Columbus was the second city in America to employ a superintendent of schools, the speaker has had opportunity to note the importance attached to figures merely.

2. From the days of Horace Mann, whose devotion to secondary education meant so much a half-century ago, until quite recently, the high schools of our cities have been measured largely in the same way. Of course numbers mean something, but size is not the vital question of the present day.

3. With the compulsory school law, so universal now, came a careful study of the quality of attendance. The chief question was: Were the children getting the benefit of the opportunities which the schools have to offer? Did they attend school?

While not overlooking the value of such general information as indicated above, the uniform reports bring to the front a more vital question than that of growth. What are the schools doing for those who attend? If there is a large percentage of nonpromotions, how is it accounted for?

No teacher can study the causes for nonpromotion in her class, taking into account irregular attendance, physical or sense defects, personal illness, mental incapacity, and indifference, without becoming more sympathetic for those who need sympathy and more interested in their welfare. Besides, the facts thus noted must come to the attention of those in authority and lead to such changes in conditions as may be necessary. No true teacher can take the pupil's cumulative card where presented, without having a special interest awakened in the child who presents it. No principal or superintendent can take the facts of failures by subjects as they come to him, without being in a measure startled by the excess in certain directions. A more careful study of the causes for failure in certain subjects is immediately started and plans for their correction are prepared. As the expert in any branch of study considers the large number of failures in his special line as reported by practically all of the school systems of the country, he will also apply himself to the solution of the problem by the preparation of a textbook better suited to the conditions and needs of the schools as thus shown.

The study of internal conditions and their improvement is the greatest school question of the present day.

We have tried to touch upon a few of the problems which have been uppermost in our minds during the year. We could not consider all, there is still much to be said: social centers, vacation schools, bibliography. As our vision enlarges, our ideals advance, and what seemed impossible at the beginning becomes surprisingly easy with knowledge and experience. The work of the year has had its special problems and difficulties for each. But forgetting the unpleasant parts of these problems and difficulties, we should press forward to a new and more advanced position, and attack the new problems with courage, hope, and enthusiasm, thinking as we see them looming up before us, as Byron said of the great St. Peter's:

> Enter; its grandeur overwhelms thee not;
> And why? It is not lessened; but thy mind,
> Expanded by the genius of the spot,
> Has grown colossal.

So, before careful preparation and thought, all difficulties must vanish.

DISCUSSION

GRACE C. STRACHAN, district superintendent of city schools, Brooklyn, N.Y.— Following is a brief outline of the plan of organization followed in New York for taking care of the exceptional child.

Special classes are established for the blind, the deaf, the crippled, the anæmic, and the mentally defective. These classes are not housed in special schools; neither does every school have any or all of these classes. For instance, in the twenty schools which I supervise, the total register of which is over 33,000, I have eight classes for mentally defective children in six schools, one class for the blind, two classes for the deaf, four classes for the crippled, and four "open-air" classes.

The crippled children are gathered from various parts of the districts, and carried in stages to the school.

The teacher of each of these classes is paid an additional salary of $100. The register in the deaf and the blind classes is ten, in the mentally deficient and the crippled, fifteen, and in the open air about thirty.

For children not afflicted in any of the ways described above, but who are not fitted for the work of the regular classes done by children of the same age, classes which we name "C," "D," "E," "Rapid Progress," and "Slow" are established.

The "C" class is composed of foreigners. The work of such classes is the teaching of English to foreigners. As soon as any child in the class has a sufficient command of English to take up the work of any regular grade for which he may be fitted, he is transferred to such class. It is evident, therefore, that the register of such classes is variable, but we try to keep the maximum at twenty-five or thirty.

The "D" class is composed of children who will be fourteen years of age during the school year, who will want to get their working papers as soon as they have reached the age of fourteen and whose educational qualifications are such that it is evident they would not be fitted to pass the test required for working papers, if held in the regular grades. The register of these classes is also limited to about twenty-five, and the course of study is modified by cutting the time devoted to some of the so-called "fads and fancies," in order to increase the time for arithmetic, English, and geography.

The "E" classes are for the over-age children. Naturally they greatly exceed the other special classes in number. The register is kept below thirty-five if possible. As soon as pupils of the "E" classes are ready for the work of the regular grade in which the age of the pupils corresponds to their own, they are transferred to such regular grade. The course of study is modified also for these "E" classes. This modification is not formal, but is left more or less to the discretion of each principal. In large schools, there is likely to be an "E" class for pupils of each year or half-year—and the pupils who are decidedly over-age are often promoted from one "E" class to another "E" class for several terms.

The beneficial effects of the organization of these special classes are:

1. The relief of the regular classes, resulting from taking out the mentally defective and otherwise afflicted children, and also those who are either abnormally bright or abnormally slow. The teacher of the regular class is therefore able to handle satisfactorily a larger number of pupils, and to accomplish much better results than under the old style of organization.

2. Much more attention is given to the individual needs of each child, as in the special classes the register is much smaller, the children of similar deficiencies are grouped together, and their progress is much more rapid.

3. The saving in money by the reducing of the number of "repeaters."

A. E. Winship, editor of *New England Journal of Education*, Boston, Mass.—Notwithstanding the extended, detailed, and graphic portraiture of the progress of the year as presented by the chairman, it is probable that everyone of us has been thinking of what has not been said.

To my thinking, the great feature of the progress of the year has been the long strides taken away from the tyranny of tradition and from the artificiality which have held a superstitious sway over the schools all too long.

For a third of a century we have been working more or less seriously to put the whole child to school, and the year 1911–12 will be long remembered as the time when we first seriously said, "Educate the child everywhere and all the time." It has been assumed until now that the school furnished all the education that was received in more than six thousand working hours. Now that we have come out from under the sway of that spuerstition we wonder that we ever assumed anything of the kind. Mr. Alderman,

state superintendent of Oregon, is the leader in a group of earnest men who are helping in the child's education everywhere and all the time.

A few specific activities in the line of progress are also worthy of notice. More has been done toward the purifying of the outhouses in country districts than ever before.

Teaching morals has had a new significance; the beginning made in studying how to teach sex-hygiene is significant.

There has been a great movement toward providing suitable home life for teachers in rural districts. For instance, Walla Walla County, Wash., has no teacher who has not a comfortable and reasonably attractive boarding-place. The county superintendent insists upon eating with every teacher where she boards. Already six school districts have built a teachers' house on or near the school lot. This movement for the decent housing of the teacher is coming to have national significance.

Neighborhood centers in connection with rural schools are assuming important proportions. In one school district, near Ellensburg, Wash., with thirty-two pupils enrolled, has been built, by public taxation, a neighborhood house costing $4,000. It has every social, physical, and public convenience of a city Young Men's Christian Association building, and brings together all the people frequently for social and public functions.

While we have been investigating and talking there are great movements sweeping us forward in the social betterment of rural communities. In all this, the year 1911–12 has been memorable.

Edwin G. Cooley, Chicago, Ill.—Superintendent Shawan has spoken of the progress made in the study of retarded children and of school attendance. There is another phase of this question which I believe is worthy of notice. There appears to be an increasing appreciation of the fact that our customary period of compulsory school attendance terminating at fourteen is too short; that this terminus was not selected as the result of any careful study of the question, but is the result of tradition. In many civilized countries at present there is a movement on to lengthen this period from two to four years, either by adding one or more years to the period of attendance at the ordinary school, or by requiring part-time attendance at supplementary continuation schools. Both movements are to be seen in Europe and America. Several of the American states have enacted laws during the last few years requiring students between fourteen and sixteen who are not at work to attend school.

There seems to be a general feeling today that to permit the boy or girl at fourteen to leave school and enter the business or industrial world without further instruction and guidance is a mistake. At fourteen, parental control is relaxing, new passions and interests in the boy and girl are awakening, and they need guidance and instruction more than ever before. To turn them loose at this time in the commercial or industrial world without this educational guidance and instruction often leads to life as a vagabond, a parasite, or a criminal.

DEPARTMENT OF KINDERGARTEN EDUCATION

SECRETARY'S MINUTES

OFFICERS

President—STELLA L. WOOD, superintendent, kindergarten normal school, Minneapolis, Minn.
Vice-President—CORA L. ENGLISH, supervisor, public school kindergarten.....Kansas City, Mo.
Secretary—A. JESSIE DAVIS, kindergarten director.....Superior, Wis.

FIRST SESSION—TUESDAY AFTERNOON, JULY 9, 1912

The department met in joint session with the Department of Elementary Education.

The meeting was scheduled to take place in the Gold Room of the Congress Hotel, but this proving inadequate in seating capacity, the meeting was transferred to the Auditorium Theater and called to order at 2:30 P.M.

Announcements were read by H. B. Wilson, president of the Department of Elementary Education, and then the meeting was turned over to the president, Stella L. Wood.

In the absence of the secretary, Marie E. Gorham, secretary of the Chicago Public School Kindergarten Association, was appointed secretary *pro tempore*.

After a few words on the importance of education in childhood, Miss Wood spoke of the new educational method, the Montessori method, stating that Dr. Montessori has interested more people than any other contemporaneous educator.

Miss Wood then introduced the first speaker, Florence E. Ward, of the Kindergarten Department, Iowa State Teachers College, Cedar Falls, Iowa, presenting Miss Ward as one whose knowledge would be particularly valuable because, added to the fact of being a worker herself, Miss Ward had the opportunity of spending several weeks making personal observations of the workings of this method by Dr. Montessori in her "Houses of Childhood" in Rome, Italy. Miss Ward's topic was "The Montessori Method."

Carl Byoir, president of the House of Childhood, New York, N.Y., followed with a talk on "The Presentation of Montessori Material." Mr. Byoir had on display considerable Montessori material and explained its object and method of use, also announcing that the material could be seen at any time at Thomas Charles's Kindergarten Supply House, Chicago, Ill.

Elmer E. Jones, professor of history of education, University of Indiana, Bloomington, Ind., was expected to present a paper on "Suggestions from Cases of Unusually Rapid or Irregular Progress in Public Schools," but was unable to be present and the paper was omitted.

At this point, Miss Wood announced the appointment of Barbara Greenwood, Los Angeles, Cal., Alice Temple, Chicago, Ill., and Alma Binzell, Winona, Minn., to serve on the nominating committee, and Lucy Terrill Ellis, Phoenix, Ariz., and Mabel Osgood, Fort Worth, Tex., were appointed to serve on the resolutions committee.

Discussion of preceding papers followed; W. N. Hailmann, of the Normal Training School, Cleveland, Ohio, and Alice H. Putnam, of Chicago, Ill., were called upon for expressions. Further remarks were made by Miss Ward and Mr. Byoir.

After the reading of announcements, the meeting adjourned.

SECOND SESSION—Thursday Forenoon, July 11, 1912

The meeting was called to order in the Gold Room of the Congress Hotel at 9:30 A.M. by the president.

The first speaker, Philander P. Claxton, United States commissioner of education, Washington, D.C., presented a paper on "The Place of the Kindergarten in the Child's Education."

George F. James, dean of the School of Education, University of Minnesota, Minneapolis, Minn., followed with an address on "The Basic Philosophy of Froebel."

Mary D. Bradford, superintendent of schools, Kenosha, Wis., read a paper on "The Kindergarten and Its Relation to Retardation."

A general discussion followed in which Elizabeth Harrison, principal of Chicago Kindergarten College, Chicago, Ill.; Mary B. Page, director of Chicago Kindergarten Institute, Chicago, Ill.; W. N. Hailmann, Normal Training School, Cleveland, Ohio; and Alice H. Putnam, Chicago, Ill., took part.

The Committee on Nominations submitted the following report:

For *President*—Mary B. Page, director, Chicago Kindergarten Institute, Chicago, Ill.
For *Vice-President*—Grace Fulmer, supervisor of kindergartens, Los Angeles, Cal.
For *Secretary*—Edith Adams, State Normal College, Ypsilanti, Mich.

This report was unanimously accepted.

The meeting then adjourned.

THIRD SESSION—Friday Afternoon, July 12, 1912

The meeting was held in Scammon Gardens, adjacent to the School of Education, University of Chicago, Chicago, Ill., and was called to order at 2:30 P.M. by the president.

After some preliminary remarks, John T. McManis, professor of education, Chicago Normal School, Chicago, Ill., gave an address on "Sense Training for Young Children."

The next speaker, Elliot R. Downing, assistant professor, School of Education, University of Chicago, Chicago, Ill., spoke on "Live Stock in Public Schools." Mr. Downing exhibited live goldfish, rabbits, silkworms, etc., and gave suggestions as to their food and care.

The Committee on Resolutions presented the following report:

Whereas, The Kindergarten Department of the National Education Association, assembled at Chicago, Ill., has received unfailing kindness, great inspiration, a feast of knowledge, and a larger vision;

Resolved, That special thanks are due our president, Miss Wood, for her untiring energy, in the preparation of this profitable program.

Resolved, That we extend grateful appreciation to those who have taken part in the Montessori discussion, which brought many to Chicago from long distances, and to the Department of School Patrons, for their courtesy in extending use of Auditorium when our own meeting-place was inadequate.

Resolved, That we express our appreciation to our commissioner of education, Philander P. Claxton, for his splendid address and his tribute to Frederick Froebel.

Be it further resolved, That the Kindergarten Department tenders its general and heartfelt thanks to each and every individual who has in thought, word, or deed made our stay among you so pleasant.

The report of the Committee on Resolutions was unanimously accepted.

The meeting then adjourned.

SOCIAL SESSION—Friday Afternoon, July 12, 1912

The Chicago Public School Kindergarten Association and the Chicago Kindergarten Club entertained the visiting kindergartners most charmingly at the close of the regular session of the Association, Friday afternoon, July 12.

The entertainment took the form of a garden party, and was held in Scammon Gardens, adjacent to the School of Education, University of Chicago, Chicago, Ill. The grounds were admirably suited for such an occasion and the day was favorable. A delightful program of folk dancing, music, and games was carried out, followed by refreshments. A pretty feature was the presentation to each guest of a bunch of field daisies and a dainty fan with wrist attachment.

Several hundred were in attendance, which was a most gratifying recognition of the hospitality offered.

Among the honored guests was the Baroness von Suttner, Vienna, Austria, member of the American School Peace League, and author of *Ground Arms*, which won her the Nobel prize.

Very special appreciation is due Miss Hofer, who directed the folk dancing and garden games, and to the committees who planned and executed the details of the afternoon's pleasure.

MARIE E. GORHAM, *Secretary pro tempore*

PAPERS AND DISCUSSIONS

THE MONTESSORI METHOD

FLORENCE ELIZABETH WARD, KINDERGARTEN DEPARTMENT, IOWA STATE TEACHERS COLLEGE, CEDAR FALLS, IOWA

During the past year the Montessori method has been so much exploited by the press that its peculiarities have become familiar to those who read and one who attempts to describe it further is in danger of repetition. It is my wish at this time simply to give you some impressions of the system that remain after a study of the work at first hand and a fortunate opportunity to gain something of the spirit of the method from the lips of its founder.

America, marked by its pioneer spirit, has never been afraid to blaze new paths in any field of activity, and has been most open-minded in its reception of light from whatever source. Because of this hospitality toward new ideas, one is not surprised to find that among the students from all parts of the world investigating the Montessori method in Rome, Americans outnumber those of any other country, and it is easy to believe that no prejudice or tradition will be allowed to prevent our fair and just consideration of this new system.

One's presence in Rome does not, however, insure illumination on the subject of the Montessori method. Dr. Montessori is difficult of access and her schools are not open to the public. So those who win entrance to the laboratory and the confidence of this quiet, unassuming originator count themselves fortunate.

To say that she answers all questions or that her system solves all pedagogical problems, as some enthusiasts do, is manifestly absurd. The Dottoressa herself makes no such sweeping claim. She does without doubt

point the way to a distinct advance along some lines of early education. Like many others, I went to Rome with some question as to whether the development of certain educational theories might not have been unduly exploited by seekers of magazine sensation. I came away, after weeks of daily coming and going in the schools, and personal acquaintance with Dr. Montessori and her associates, with the conviction that no more earnest, sane contribution has been made to education since the time of Froebel and Pestalozzi than this made by Dr. Maria Montessori in her Case dei Bambini or Houses of Childhood in Rome, her peculiar service to pedagogic science being her application of generally accepted principles with a technique and original development and use of didactic material which give to these remarkable power and scope.

I need say little of these principles, for they are the familiar and accepted ones upon which all modern education is established. Dr. Montessori holds to the theory that self-activity is the only means of growth; that "all human victories, all human progress, stand upon the inner force"; that personality can develop only in an atmosphere of freedom; that environment, while it cannot create character, should provide wholesome stimulus for its development—not only the outward freedom of air, sunshine, and space, but the more vital freedom from invasion by other personalities. Believing that the child can develop social virtues only by personal contact with social problems, the school in her hands becomes a microcosm of the normal social community, wherein the child confronts and solves for himself real problems. Since the highest ideal of social organization is self-direction in the use of liberty under law, Montessori insists that the only legitimate discipline is that which leads the child to control himself. Instead of annihilating the will, her method leads to the finest type of independence.

In sharp contrast with the usage which makes the teacher the dominating figure in a schoolroom, is the self-effacement of the Montessori directress. Like Froebel's ideal kindergartner, she must be "passive, not active; following, not leading." Dr. Montessori's own illustration of the function of the teacher makes this point clear. She reminds us that the useful guide who shows to a visitor a thing of artistic beauty simply says enough to enable the sightseer to understand and appreciate the object contemplated, then withdraws himself, for the guide is not the object of greatest interest. So the teacher must give desirable information, direction, and inspiration, then leave the child with the new truth. The garrulous teacher is an abomination to Dr. Montessori. She holds to the form of lesson presentation used by Seguin, minimizing words and calling forth much mental activity on the part of the child. "A child smothered with words comprehends little that is said to him."

I once visited a board school in London where there was that painful quiet of suppressed, inactive children. Only one boy out of sixty moved

in his place, and when this one swung his feet gracefully into the aisle to make the spine-curving seat less uncomfortable he was sharply reproved, and the teacher said by way of apology, "I have had this boy only two days." I knew without her telling me that this free little being had not been long in such an atmosphere, but that he would soon succumb to the wet-blanket treatment and be as unnatural and "good" as the others.

Dr. Montessori says:

> We do not consider an individual disciplined only when he has been rendered as artificially silent as a mute and as immovable as a paralytic. He is an individual annihilated, not disciplined. We call an individual disciplined when he is master of himself.

Fundamental to all Dr. Montessori's work is her emphasis upon the value of sense-training, especially the basic sense of touch, which she makes use of as a main avenue for intellectual awakening. The results which she gets from her methods of teaching reading, writing, and number are truly remarkable, both in the small amount of conscious effort put forth by the child, and the brief length of time required.

Montessori's thought is not to push the child forward into experiences beyond his period of development but rather by expediting mechanical routine to prevent his forming a distaste for study and thus to bring him open-minded and alert to the earlier enjoyment of exercises in literature, art, and science.

One might think that only a skillful teacher, perhaps a Montessori herself, with a selected group of children, could accomplish such results; but here the visitor meets with surprise. There are a number of these schools, in widely differing quarters of Rome. In them are found children from all classes of society. There is the Pincian Hill School with its tenderly reared scions of the exclusive aristocracy; the one in Via Giusti conducted by the Franciscan nuns and composed of children from the self-respecting middle classes; and the school of San Angelo in Pescharia with its children of the lowest social strata.

That the Montessori system is fundamentally right is demonstrated by the fact that it seems to work successfully with all these various types of children, despite the differences in heredity, home environment, and early training.

As for the qualifications of the teacher, or "directress," as Dr. Montessori prefers to call her, there is wide range, from the scholarly, scientific Dr. Montessori herself to the cloistered Franciscan nun. The earnest teacher imbued with reverence for the child's personality and the ideal of its development in an atmosphere of freedom is bound to win a measure of success. Often she becomes powerful, beyond her own expectation, as Dr. Montessori has so admirably argued.

In Via Giusti is the school which Dr. Montessori conducts under her own personal supervision and it is here that one sees the real laboratory in which the Dottoressa is watching the practical working-out of her plans,

under physical conditions that are quite ideal. Instead of a single schoolroom with stationary seats and desks, as found in the average primary school, these children enjoy large open courts and generous spaces for gardens and games. All furnishings are made with a view to children's comfort and convenience, even the chairs and tables being light and movable. The didactic materials and apparatus inviting investigation are everywhere in evidence.

Instead of arranging the children in even rows and classes and requiring that at stated times they shall engage in prescribed occupations, they work singly, or form themselves into natural groups according to mutual taste and present interest. Often a dozen different activities are going on at once, the children going freely to the convenient cupboards for the auto-educational, self-corrective materials in the use of which these schools are so unique. There is no confusion, no disorder, neither is there the unnatural quiet which is the fetish of the overorderly teacher. One might fancy the school anti-social until it comes time for the games, the serving of the luncheon, or other exercises which require community effort.

Montessori has comparatively few dramatic games and little interest in make-believe. She holds that the child hungers for reality and for purposeful activity, and puts into his hands the tools for gardening and for many of the household processes. She believes that the truth and wonder of the world furnish all the food the imagination needs, so the fairy story is not much in evidence.

This blending of work and play, of doing for the sake of the product, of appealing to the child's understanding as well as his imagination, develops habits of thrift, industry, and service, and gives self-mastery and bodily poise. It is delightful to watch the absorbed interest with which these little workers sweep and fold their small rugs and the housewifely precision with which they put away their little brooms. Their earnestness is illustrated by the oft-repeated story of the Queen's visit to one of these schools. A child who was arranging some materials was asked by the Queen to read; she smiled acquiescence, but continued her work. An older person, embarrassed by the child's apparent indifference, said, "Rosa, don't you know that this is the Queen?" "Yes," said the child, "but doesn't the Queen know that I must put away my work before I begin to read?"

I have only attempted in this limited time to speak of a few of the distinctive features of these Italian schools, and have not discussed the feasibility of their adoption here in America nor have I made comparison between the Montessori school and the kindergarten. I will state, however, that I believe there is little inherent antagonism between the general ideals of Montessori and those of the broad-minded disciple of Froebel.

The kindergarten and the Montessori school are built in the main upon the same basic principles. In the working-out and exemplifying of these principles we find marked differences. These should call forth friendly investigation and discussion.

One who associates eccentricity with genius will be happily disappointed in meeting Dr. Montessori. She is a graceful, queenly woman of much personal charm. Always becomingly gowned and free from affectation, she illustrates the fact that there is no necessary antagonism between brilliancy of mind and attractiveness of person. She proves on acquaintance to be an untiring seeker after truth. Personal recognition and especially sensational notoriety are farthest from her desire. Her hope is that American educators will give her study and results serious consideration, judging them finally on their own merits, and that her materials shall not be separated from the use for which she has so painstakingly perfected them, but rather kept together as parts of a system.

One who seeks to be fair and candid, I feel sure, must conclude that while

> All the good the past has had
> Remains to make our own time glad,

there is not yet any such thing as finality in methods of teaching small children. It is not likely that we shall see any clear line of cleavage between the old and the new, but we shall no doubt see in time the introduction of every demonstrated principle which will help children to escape unnecessary drudgery, and to find the acquisition of truth and power a process of delight.

THE PRESENTATION OF MONTESSORI MATERIAL

CARL BYOIR, PRESIDENT OF THE HOUSE OF CHILDHOOD, NEW YORK, N.Y.

An inquiry now into the methods of Dr. Maria Montessori can only serve to furnish the basis of a comparison between kindergarten and primary education in the United States and the methods pursued in the "Houses of Childhood" in Rome, with a view to the possibilities of adapting for our use whatever may be of value under our conditions. The most casual observer will recognize at once the fact that American teachers are working in a school environment entirely different from that of the Montessori schools in Rome. On this account, it is possible now only to form a judgment which actual teaching observation in our schools must confirm or deny. Dr. Montessori's own book is a complete exposition of her method. It would be too presumptuous here to attempt more than to indicate to the American student how the Montessori method may be approached for an understanding of its relation to our teaching methods.

Those who seek to compare Dr. Montessori's principles with the methods of the kindergarten or the primary grades will find singularly few points of comparison. This does not mean that the method of the Dottoressa is educationally "a bolt from the blue." It means simply that the principles underlying her method have been developed in an isolated

field; a field in which a few exact scientists have devoted their lives to the betterment of the conditions of the unfortunate. We shall find many points of contact when we compare this method with the methods that have long been in use in the teaching of the blind, the deaf and dumb, and the mentally defective.

Maria Montessori, as a teacher of the idiot children of Italy, found in the methods of physiological sense-training a formula applicable to the education of normal children. She has applied this formula with the method of the experimental psychologist. In Dr. Montessori's career we may observe a life of preparation for the bringing-together of educational methods which have been long applied in distinctly separate fields. With a splendid knowledge of the history of methods, Dr. Montessori has combined the fruits of special training; as a physician, she learned the physical needs of the child; as a teacher of deficient children, she mastered the methods of sense-training; to an exact knowledge of psychology and anthropology she has added an inventive mechanical genius probably unrivaled in the history of education. This great Italian teacher has built a new laboratory of experimental psychology and equipped it with new instruments of psychometry fitted to the needs of her child subjects.

We shall find the historical basis of the Montessori method in the work of Itard and Seguin with idiots; in the work of Periere with deaf mutes; of Haüy for the blind, and in the treatises of the Christian School (St. Simonism). Similarly, we shall see that the principles underlying the Montessori method have more in common with the theories of Spencer, Rousseau, Descartes, and Pestalozzi than with the philosophy of Froebel. Such a statement is not intended to mean that there are inherent conflicts between the methods of the kindergarten and those of the Case dei Bambini. Rather they are supplemental methods in whose combination the American teacher may find a mean of improved pedagogy.

In *The Montessori Method*, Dr. Montessori has most generously acknowledged her indebtedness to Seguin. Long before Seguin returned in 1880 from the Vienna Universal Exhibition as United States commissioner on education, he had dreamed of "the union of the joyous exercises of the kindergarten, with the application of physiology to education." This dream has found in the work of Dr. Montessori a fuller realization than Seguin could have imagined and a richer fulfillment in a method that is psycho-physiological. Over half a century has passed since Seguin wrote in *Idiocy and Its Treatment:*

> The physiological education of the senses is the royal road to the education of the intellect; experience, not memory, the mother of ideas.

Dr. Montessori has answered the appeal of Seguin and from the physiological methods of the education of idiots has "obtained a formula applicable to universal education."

One other principle of Seguin underlies the method of Montessori: education thru the development of the affective functions. It may be true that the study of Seguin inspired in some measure Montessori's beautiful love for the child. Certainly it is true that these great French and Italian teachers combine with a common method of physiological sense-training the principle that

> to make the child feel that he is loved, and to make him eager to love in his turn, is the end of our teaching as it has been its beginning. If we have loved our pupils, they felt it and communicated the same feeling to each other; if they have been loved, they are loving.

Much emphasis has been laid upon the methods of Seguin because it is only thru an understanding of Seguin that we shall fully understand Montessori. It might be well in the serious study of the Montessori method to bear in mind Seguin's conclusions from the experiments of Periere:

> 1. That the senses, and each one in particular, can be submitted to physiological training by which their primordial capability may be indefinitely intellectualized.
>
> 2. That one sense may be substituted for another as a means of comprehension and of intellectual culture.
>
> 3. That our most abstract ideas are comparisons and generalizations by the mind of what we have perceived thru our senses.
>
> 4. That sensations are intellectual functions performed thru external apparatus as much as reasoning and imagination thru more internal organs.

The methods of Seguin adapted and improved may be seen in practical application at such splendid American schools as the Massachusetts School for Feeble Minded, at Waverly, Mass., and the Seguin School, at Orange, N.J. In the school at Waverly there is a richness of sense-training material and a success in its application probably surpassing even that of Dr. Montessori in the Italian schools for idiots. In adapting the materials of Seguin employed in these and similar institutions, Montessori has carefully eliminated those too obvious steps which are necessary for the education of the deficient, but which will not serve for the normal child. Montessori has added to the groundwork of Seguin the fruits of a mechanical genius probably unparalleled in the history of education. Her apparatus shows in every piece an infinite patience in the observation of the processes of the mind of the normal child and an ability to translate her thoughts into concrete materials.

The didactic apparatus used by Dr. Montessori is not a set of mere separable toys. Neither are these materials used simply for the purpose of sense-training. In the fullest sense they are the instruments of the psychological laboratory. The method of Dr. Montessori is the method of the experimental psychologist. But the apparatus of the psychologist was not available for the purposes of Montessori because her subjects were very young children. The apparatus of the psychological laboratory

for mental tests depends in its application largely upon the observations of the subject. Professor James expresses this concisely in the statement, "Introspective observation is what we have to rely on first and foremost always." But methods dependent upon introspective observation are almost useless in testing children under five years of age; for instance, the test-type or the astigmatic chart in the tests for visual acuity. The child cannot read, nor can he express the visual impression obtained from the chart. So in testing auditory acuity, even so practicable an instrument as Seashore's audiometer, largely used in tests with school children, would doubtless becomes less valuable in tests with very young children. Tests dependent upon introspective observation are usually also dependent upon the nomenclature of the subject for expressing his impressions. Needless to say, the three-year-old child is not capable of the adequate expression of its own impressions.

In an investigation of the Montessori didactic apparatus, viewing it in the light of the methods of the laboratory, it is important to bear in mind a distinction emphasized by Dr. Montessori. The psychologist measures the senses; Montessori educates the senses. When the psychologist has secured his data, his work with the individual subject is done; when the teacher of the Montessori method has measured the sense acuity of the pupil, a basis for the education of the senses of the individual has been secured.

Even as the psychologist finds no detail too trivial to be neglected in the "setting" of a test, so Dr. Montessori lays emphasis upon the methods of administration. This gives rise to the necessity for the fundamental principle of the complete liberty of the child in its spontaneous observations. If the teacher first shows the child how to build the "broad stair," she has learned nothing of the child's perception of the relation of blocks of graded sizes. But if the child, playing unaided, builds an irregular stairway, the teacher easily observes that the child cannot regularly relate these blocks. So the teacher no longer leads the child, but follows as an observer. The teacher stands in the place of the experimental psychologist. Once the child's faulty observation is ascertained, the teacher becomes a leader to show the right way. Seguin saw that this was the place of the teacher in the application of sense-training method when he wrote:

> Before entering into the generalities of the training, the individuality of the child is to be secured; for respect of individuality is the first test of the fitness of a teacher. At first sight, all children look much alike; at the second their countless differences appear like insurmountable obstacles; but better viewed these differences resolve themselves into groups easily understood.

This corroborates the actual teaching experience of teachers of the Montessori method: that the first few weeks of individual observation are weeks almost of chaos. But out of these apparently unmanageable

differences there arises an almost perfect discipline. The method trains the individual, but the early days are trying ones for the teacher. Some activities must be suppressed; peculiarities must be watched; individuals must be assisted toward finding their place in the new school community. As a result of these days of observation, the teacher acquires a knowledge of the individual needs of her children that makes possible the discipline born of the happy employment of the pupils.

A study of the Montessori apparatus as sense-measuring and sense-training material is best made in the sequence in which it is presented to the children. The dressing-frames are not properly a part of the sequence in sense-training. They have their place properly in what Dr. Montessori terms "gymnastica." They develop in the children a practical facility in the use of their fingers and make an interesting game of the simple operations of dressing. They constitute a part of the system which has as its aim the preparation of the child for independence in his environment. Probably, too, these simple little frames have a direct importance in the preparation for writing. Their mastery by the child requires a number of complex motor correlations which entirely escape the casual observer. The defective child is almost entirely incapable of these correlations. Normal children have a lack of facility in the use of their own fingers in buttoning, tying, and lacing, which the adult mind can scarcely comprehend. Since these materials have been exhibited in America, many fond parents, upon examining these frames, have made such remarks as, "My little girl wouldn't be interested in that; they are too easy." This same parent is unutterably surprised when she discovers that her little girl cannot do many of these simple things with any degree of facility. In this connection, it is to be observed that the children of the Case dei Bambini are the authors of their own materials. Dr. Montessori has developed her apparatus after years of painstaking observation of her little pupils, and often the minutest details of mechanical construction, often overlooked by the adult observer, are of great importance to the child mind.

The sensory training properly begins with the six sets of wooden blocks. All of these sets of blocks are truly "auto-educational," the materials are self-corrective. There is only one correct combination in each set. Either the given lesson is correctly done and the child knows that it is right, or it is incorrectly done and the child knows that it is wrong. The teacher as a passive observer acquires an exact knowledge of the limits of the child's perception. All of these block games have an objective test. For instance, in the "long stair," the child has a double opportunity to perceive errors thru the graduating lengths of the sticks and the regular alternate coloring of the decimeter units. The three sets of cylinders, being the first step in visual perception of differences in size, are most positive in the correction of errors. If the child misplaces any one of these cylinders, he finds himself at the end with a cylinder for which

there is no socket in the base. Later, he makes the correction immediately upon perceiving that a given cylinder does not exactly fit where he has placed it. Later when the child begins numeration, he begins with these same blocks and approaches a new problem with the confidence born of familiar materials. All of the block games are composed of ten pieces and form the basis for the decimal system as well as for counting. The "long stair" is particularly rich in its possible combinations for counting, addition, subtraction, division, and multiplication. Much of the Montessori work is like this: the children become thoroly familiar with many fundamental forms long before they know what they are, or what advanced uses are to be made of them.

The color spools show more definitely the laboratory method. In duplicate boxes, there are sixty-four color spools. These colors are not pure primary colors and tints and shades. They are color mixtures. The effort is not to teach the child the colors or their names, but to train the sense of color discrimination. The child must make very fine discriminations in laying out and matching these colors. If the little pupil in arranging a color carpet mixes a lighter spool among the darker ones, the teacher-observer sees at once the child's faulty perception. It is not necessary for the tests that the child have any knowledge of color or know the names of colors. Indeed, few adults could find names for all the Montessori spools.

So the laboratory analogy could be carried out with practically every piece of the Montessori material. The teacher must be not only a well-trained teacher, but a well-trained observer. An analysis of the method from this point of view indicates how much misapprehension has been brought about by Dr. Montessori's use of the term "auto-educational." A large and imaginative American public is prepared for a system that requires no teaching, and expectantly awaits the phenomenon of a convenient room, supplied with blocks and sandpaper letters, incubating child prodigies, who, at the age of four, will come forth with a knowledge of many languages and complete understanding of higher mathematics. If there is any method which requires well-trained teachers, it is the physiological method of sense-training.

DISCUSSION

W. N. Hailmann, Normal Training School, Cleveland, Ohio.—It is gratifying to note that, in the presentation of her work, Dr. Montessori bases her procedures broadly and eloquently upon recognized principles of the new education of which Froebel is the acknowledged prophet. Her *Method of Scientific Pedagogy* is replete with appeals in behalf of self-activity, independence, self-help, freedom, respect for the child's individuality and spontaneity.

In truly classic style, she satirizes certain shortcomings of the current school: its unhygienic seatings, its repressive discipline, its artificial incentives, its disregard of the child's needs, its false methods, and the rest.

For this, for her single-hearted devotion to her children and to her work, for the

fervor and impressiveness of her words, for her vigorous advocacy of the "scientific spirit" on the part of teachers, for her ingenuity in providing a stimulating environment and effective devices for her purposes, as well as for the enthusiasm she stirs in all who are touched by her work, she is entitled to the admiration and gratitude of all who are interested in the momentous work of education.

The charm and cogency in the establishment and defense of her principles should not, however, carry us off our feet. For it is not these principles, but certain details and specific achievements in their application to the conduct of her "Children's Houses" that constitute the claim to the prominence given to her work.

Conspicuous among these details are her devices for sense-training. Dr. Montessori justly attaches primary value to sense-training in the mental development of the child. Indeed, a number of her exercises can be used with advantage in the play-work of the kindergarten and of the primary school. But, in her hands, these plays yield no outcome beyond the training of the senses, furnish no stimulus to the child's imagination, no opportunity for the exercise of the constructive and creative instincts. The child recognizes and names certain sense impressions with remarkable accuracy, but fails to apply these to purposes of self-expression. To use Froebelian terms: the child deals in these exercises all but exclusively with forms of knowledge, but remains a stranger to forms of life and of symmetry or beauty.

Again, these exercises as conducted in the Children's Houses exert in character and circumstance an intensely isolating influence. Usually, each child plays alone, finds practically no intellectual sympathy, no opportunity to use his successes in social effort. Even in some of her otherwise excellent color and sound games and in certain marching exercises each child is practically alone, fails of social intro-ordination in a common purpose, fails to feel that his presence is needed for social success. Nor can I find any indication that the free and directed games relieve this dearth in social application of individual ability in sense-perception.

Probably these shortcomings, if they are such, are due to Dr. Montessori's antecedents. It appears that she gained her pedagogic enthusiasm in connection with the education of defectives in an insane asylum. Here, following the lead of Dr. Seguin, she achieved surprising results, and even brought some idiots to read and write and to prove their ability subsequently at an examination in the public schools together with normal children. This, when she came to take charge of the Children's Houses, led her to attempt the application of the methods for defectives to the education of normal children between the ages of three and six, and to formulate the plausible principle that the same didactic material which with defectives renders education possible will with normal children stimulate auto-education.

It is obvious that work under such a principle—involving neglect of language, of self-expression, of social tendencies, of productive and creative activity—threatens arrest of development in these directions. A notable instance of this is related by Dr. Montessori, altho with different intent.

Some visitors who had noticed that the children could read print, sent them some illustrated books, simple stories which she, however, felt they could not understand, altho the teachers had assured her that they could read better than the second elementary. Dr. Montessori, in order to assure herself, had the teachers tell the children the stories in order to see how many were spontaneously interested. The teachers were not to call the children to order. After a few words, the children began to withdraw their attention, and soon all were noisily engaged, each in his chosen occupation.
